The promoters of the proposed interurban line from Charleston to Paris by way of Ashmore have been making good progress with the preliminary work, and it is hoped to have the line in operation by July 1, next year. Charles H. Cox, Mattoon, is General Manager.

Connell Bros., Jamesville, Wis., have started work on their contract for erecting a new round house and machine shop at Nelson for the Chicago & Northwestern Ry. The contract amounts to about $65,000.

Active work securing the necessary right of way for the Illinois Traction system line from Morris to Joliet has been started, and it is hoped to get this done in season so that grading can be started by June 15. The line will parallel the Rock Island tracks, going from Morris through Minooka and then on to Joliet.

The Taylorville Street Ry. Co. of Taylorville, is to at once extend its line south to the Christian County Coal Co.'s mine.

Surveys for the foundation of the new Lake Shore & Michigan Southern Ry. tracks which are to be erected in Elkhart are reported to have been started. These shops will cost about $3,000,000 it is said. S. H. Scharschmidt is Resident Engineer at Elkhart.

The business men of Lynnville have formed an organization for the purpose of getting a traction line for the town. Lynnville is an inland town ten miles from Boonville, Ind., which is on the Southern R. R. and the terminus of the Evansville & Boonville traction line, and seven miles from Lynn station, on the Evansville and Indianapolis R. R. The Lynnville merchants hope to induce the Evansville & Boonville Co. to extend the traction line on to Lynnvillle.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Harrington Bros., St. Louis, Mo., have started work near Denver Junction on the contract for grading on the extension of the Waterloo, Cedar Falls & Northern electric line.

The Chicago, Rock Island & Pacific Ry. is preparing to relay 88 miles of track on the Iowa division with 90-pound steel rails, which will be substituted for the ones of lighter weight now in use. The portions of the track to be relaid are between Davenport and West Liberty, and Van Meter and Adair. This is the first step in relaying the entire line in Iowa with 90-pound steel, which will be followed next year by building a second track from Iowa City, the present terminus of the double line, to Altoona, where connection will be made with the Keokuk line for Des Moines and Valley Junction. Mexican laborers will be used for the work.

The Chicago, Burlington & Quincy R. R. is to build a subway at North Main St. in Albia.

The Chicago Great Western Ry. is said to be planning to expend $2,000,000 the coming summer in improving its lines and service in Iowa, the improvements to consist of double tracks, new rails and motive power.

The Cedar Rapids Construction Co., E. J. C. Bealer, President, Cedar Rapids, has a number of contracts on the Iowa, Minnesota and Dakota Divisions of the Chicago, Rock Island & Pacific Ry.

Surveys for the extension of the Muscatine North & South Ry. have been completed and final estimates are now being made in the company's offices at Davenport. It is said that as soon as these are completed active construction work will be started.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of McCormick Camp, Fuller, Curranville and other towns lying between Frontenac and Mulberry, have asked the Pittsburg Electric Ry. Co., of Pittsburg, Kan., to extend its line from Frontenac to Mulberry.

The city of Wichita has voted to construct a $25,000 concrete dam across the Little Arkansas river at Central Ave.

The Arkansas Valley Interurban R. R., C. D. Bell, Chief Engineer, Wichita, is now considering plans for building the line northward from Wichita to Belle Plaine and other towns. Preliminary surveys have been made for such a line and steps are now being taken to secure bonuses along the route.

The Missouri Pacific Ry. as part of its improvement plans in Kansas, will put in sidings every five miles on its line between Atchison and Kansas City, every siding to be 6,000 ft. long. Eventually similar improvements will be made between Atchison and Omaha to accomomodate increased traffic.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The New Orleans Drainage Co., Warren B. Read, President, New Orleans, La., is reported to have purchased a 34,000 acre tract of land below Gentilly Terrace, near Lee Station, and ranging between five and seven miles from the heart of New Orleans. Part of the acreage was a sugar plantation at one time and all of it is high-class tillable land, although needing to be drained as a whole.

The Police Jury of Arcadia Parish, La., has adopted an ordinance creating a new drainage district to be known as the Crowley and Sixth Police Jury Ward Drainage District of Arcadia Parish. The new drainage district extends from Bayous Plaquemine, Brulee and Wikoff on the north to Bayou Quene de Tortus on the south, and includes within its limits the Ebenezer drainage district. P. S. Lovell, P. L. Lawrence, H. E. Lewis, Edmer Faulk and Clebert Simon are the commissioners.

Among those interested in a proposed electric railway in Algiers, La., franchise for which is to be sold shortly to the City of

New Orleans, are the following: Peter Lawton, ex-Governor Warmoth, J. J. Manson and J. B. Esnard, of New Orleans, La. The new line is to be operated in Algiers beginning at the ferry landing and running out Morgan and Patterson Sts. to the site of the immigration station to the cut-off at the parish line. It is intended to extend the line eventually to Grand Isle.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Detroit United Rys. Co., F. W. Brooks, General Manager, Detroit, Mich., is planning the expenditure of about $400,000 for constructing five miles of track for its new cross-town lines at Flint.

The construction of an electric railway from Ann Arbor to Flint by way of Fenton is being advocated by Father David L. Dillon of Fenton, and it is believed that the line will be constructed.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Application has been made to the Village Council of Hibbing for a franchise for a street railway line in Hibbing, running south on Second and Third Aves. to the village of Alice. The line will be operated with a gasoline motor car, and will cost in the neighborhood of $30,000. G. N. Butchard, John Sheehy and Frank Lavell are interested.

Duluth and the Ranges.

BY PETER E. MEAGHER.

C. J. A. Morris of the firm of Morris & Shepard, Railroad Contractors, was a caller at the office this week, and reported that they had their 85 miles on the Great Northern fairly well covered with sub-contractors, but, still, they could use two or three more outfits, if they could get them.

Arthur Mitchell, General Superintendent for MacArthur Brothers Co. in this section of the country, was a caller and reported everything in a very nice condition on their two large stripping jobs on the Iron Range near Duluth.

E. P. Arsneau, one of the old time contractors, spent a few days with us here recently. He was on his way home to Spokane, where he is going to rest up for a week or two. He then will look around for a steam shovel contract to keep him busy.

A. Nelson, the team contractor, was a caller here last week, and we secured him a subcontract from Morris & Shepard on the Great Northern Railroad in North Dakota, and he shipped out there with his outfit.

Andrew Perrin of the firm of Carl Hall & Co., contractors, was a visitor with us last week. They have two or three small jobs on the Duluth & Iron Range R. R. near Duluth.

All the mining companies and stripping Contractors in this vicinity made their laborers quite happy recently by declaring a voluntary increase of 10 per cent in their wages, same to take effect April 1. They have also cut out all Sunday work, and there will not be a shovel working, or a yard of stripping, or a ton of coal mined on that day. This was a very nice thing for these people to do, and will be appreciated not only by the men it directly affects, but also by those who do not have any interest in this question whatever, because we all know that a man who puts in six days hard work a week, is certainly entitled to one day of rest.

Michael Murphy and J. E. Erickson of the contracting firm of Murphy Brothers & Erickson were callers at this office recently. They are getting along very nicely on their subcontract from Foley, Welch & Stewart on the Soo Line, and expect to have the same completed about Aug. 1 this year.

Will Philips, representing the Taylor Iron & Steel Co., High Bridge N. J., manufacturers of Tisco manganese dipper teeth, was a visitor with us recently. He reported business in his line very good.

G. A. Jones of the contracting firm of Jones Bros. spent a day with us here last week. He came up from their large contract at Middletown, Ohio, to look over their contract of stripping the Crosby Mine at Nashwauk, Minn. He said that their work in the different sections of the country was in a very nice shape, and that the outlook for new work was very good.

J. H. Rooney of the Pastoret-Lawrence Co., contractors of this city, was a caller and reported that they had just been awarded a water works contract by the City of Eveleth, Minn., and would start on the same immediately.

Edward Kimball of Kimball Brothers, contractors, spent a couple of days with us last week, and reported that he had taken 150,000 yds. of work for Morris & Shepard on the Great Northern Railroad in North Dakota. He shipped two carloads of horses from this point, and will start on this work immediately.

R. S. Bloome & Co., paving contractors, were awarded a contract for street paving by the city of Eveleth last week, and will start on the same immediately.

P. W. Jones, equipment man from Minneapolis was a caller here the other day. The writer did not see him, as he was out of the city. Mr. Jones reported business very good in his line.

Hagstrom Brothers, contractors, were callers recently, and we shipped a carload of their horses to Morris & Shepard's work on the Great Northern Railroad in North Dakota.

The Northern Pacific and Great Northern Railroads are doing a great deal of construction and maintenance work in this vicinity, and in North Dakota. The G. N. Road are retieing its roadbed from Duluth to the Twin Cities, and the N. P. is laying heavier steel the same distance. The G. N. Railroad last week let a contract to A. Guthrie & Company, for about two hundred and ten miles of new work in the vicinity of Minot, N. Dak. The N. P. Railway Co. also let this same firm quite a bit of work in the same vicinity. This work is to be started on at once.

Winston-Dear Co., stripping contractors on the Iron Range near Duluth, recently purchased 100 12-yd. standard gauge dump cars used on their contract of stripping the Buffalo & Susquehanna Mine near Hibbing, Minn.

The writer has just returned from a trip to the Twin Cities and while there, called on most of the large contracting firms, and found practically all of them loaded with bunches of work, and figuring on quite a bit more. If there are any sub-contractors that are looking for steam shovel, rock, team or concrete work by addressing this office, we will be glad to put them in touch with people who can give them all the work that they will be able to take care of for this season at least.

The labor situation at Duluth and vicinity at the present time is in a very prosperous condition. There are a large number of men here, and there is also quite a demand for them. The wages offered are very good, and no man in this vicinity need be without work. The demand for men here is going to be very good all the coming season, as there is lots of work under way now, and more coming up.

Contractors and others, when in this vicinity are cordially invited to make the Labor and Equipment Office of Peter E. Meagher, 409 West Michigan street, their headquarters.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Springfield Traction Co., of Springfield, is planning a number of improvements for this year. These will include the construction of the north end cross-town line which will connect the Springfield Ave. and Doling Park car lines, and the construction of a subway under the north side Frisco tracks on Grant St., and the laying of new steel along the new route to be followed by Park and Atlantic St. line cars.

Officials of the St. Louis-Kansas City Electric Ry. Co., which was incorporated some time ago under the laws of Missouri, have announced that the engineering corps in the field has finished the final locating of 75 per cent of the road. The company proposes to construct a double track air line between St. Louis and Kansas City at the shortest distance possible, estimated at 250 miles. The line is to be in operation inside of two years, according to its promoters. D. C. Nevins, Kansas City, is President and E. D. Cauthorn is Chief Engineer.

The route has been secured and it is expected that active work will be started shortly on the projected electric railway from Springfield to Nixa, Christian County, surveys for which have been made by W. H. Schreiber, of Springfield.

Three-fourths of the right of way for the proposed motor line of the Springfield, Mt. Vernon & Southwestern Ry. is said to have been secured. This line is being promoted by F. C. Yentsch, of Mt. Vernon, Mo., and the route as now proposed includes Springfield, Halltown, Paris Springs, Mt. Vernon, Hoburg, Friestatt, Monett, Pierce City, Clarkson and Sarcoxie.

The City Council of St. Joseph has passed an ordinance granting the St. Joseph Street Ry. Co. a franchise to build a line on Third St., from Francis to Michel.

The Metropolitan Street Ry. Co., of Kansas City, has at work at present 500 men repairing tracks, roadways and paving, and this force will be kept steadily at work throughout the year, until all the track, roadways and paving are in first class condition. The company has also begun the construction of an extension to its Westport line from its 45th St. terminus to 55th St. at Kansas City.

St. Louis Items.

BY A. B. KOENIG.

The L. J. Smith Construction Co. have added two more 110-ton locomotives and one 85-ton steam shovel to their outfit in Kansas and Colorado.

J. J. Fitzgerald, Whitham, Mo., was in town the other day looking for work for his 16-team outfit.

H. C. Cass is in the market for work for his 17-team outfit. Leavenworth, Kas., or Carrollton, Mo., will catch him.

Costello Bros., who are doing the double track work on the Big Four R. R. between Shelby and Greenwich, Ohio, also 40 miles of double track work between Anderson and Indianapolis, Ind., have some nice team work to let on this job. They also have 6,000 yds. of work on the Missouri Pacific R. R. near Kirkwood, Mo., to let at elegant prices. Clay Pool bldg., Indianapolis, is where they are making their headquarters at present.

Burke & Joseph, Cape Girardeau, Mo., have 40,000 yds. of spur track on the Kansas City Southern at DuQueen, Ark., to let. One-third of this is earth, one-third loose rock and one-third solid rock. Write them to Cape Girardeau, Mo., or Ft. Smith, Ark.

J. J. McInerney writes us from Washington, Ia., that his 15-team outfit is idle at that place.

The Missouri Pacific R. R. Co. are going to let quite a lot of double track and betterment work in Missouri and Northern Arkansas on April 20th. E. F. Mitchell is Chief Engineer of Construction.

J. R. Morris, superintendent McArthur Bros.' Construction Co., came in from Chicago looking for some team outfits to put on their Shoshoni, Kirby extension of the Burlington R. R. in Wyoming.

John Marsch has resumed work on the Northwestern R. R. in Illinois.

Ransom & Cook, Ottawa, Kas., have two or three jobs on about 10,000 to 12,000 yds. each to let.

R. L. Whitney, bookkeeper for the L. J. Smith Construction Co. of Kansas City, spent last Saturday in St. Louis, and returned to Kansas City.

Foley Bros. bought five carloads of big mules here last Saturday and shipped them to their Grand Trunk Pacific work in Canada.

J. H. McFarlin, who is building the Springfield and Jacksonville Electric line,

has 387,000 yds. of fine team work to let on this line, also have one piece of steam shovel work. Address McFarlin at Jacksonville or Springfield, Ill.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Land agents of the Northern Pacific have been closing deals for right of way for the proposed N. P. line from Bridges into the Bear Creek coal fields. The Northern Pacific has had a crew of civil engineers in the Bear Creek fields and the Clarke Fork canyon over the bench into the Cooke City mining district.

Applications as follows have been filed with the Carey Land Act Board at Helena, for the creation of two Carey projects: R. A. Carnochan, of Butte, for the withdrawal of 23,000 acres in Madison and Beaverhead Counties for the Ruby river project, and Walter Winnett, of Lewistown, for the withdrawal of 17,500 acres in the Flatwillow country in Fergus County.

Grading has been begun on the extension of the Bozeman Interurban road from the Springs to Three Forks. Three outfits of graders are located between the Springs and Manhattan, and another, which will do the heaviest work on the line, has commenced at Logan. Besides these, there is a party engaged in clearing the roadway along the West Gallatin. It is hoped the grading will be completed by Aug. 15. With this extension the company is preparing to improve its terminal facilities at Bozeman and will build a spur to the Bozeman Milling Co.'s plant.

The Chambers of Commerce of Hamilton and Stevensville, Mont., are continuing their efforts to secure the construction of an electric railway between the two cities and it is believed that announcement giving definite plans for the work will be made soon. John Dowling and John McLaughlin, Stevensville, are interested.

The City of Kalispell has voted a franchise for the proposed Whitefish-Polson Electric Ry. Co.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Elmira Water, Light & R. R. Co., of Elmira, has had surveys made with a view to extending the present Pennsylvania Ave. line to Southport Corners during the coming summer. The company is also said to be considering the construction of a belt line connecting the Franklin St. line and the Pennsylvania Ave. line.

Surveys have been started for the proposed electric railway from Bolivar to Wellsville, a distance of 15 miles. The proposed line will follow the route of the old B. & E. C. R. R. most of the way. The line is to start from the Shawmut R. R. station in Bolivar and end at the fairgrounds in Wellsville. E. M. Bedford, Portville, is engineer.

The Northern Central R. R., J. H. Nichol, Principal Assistant Engineer, Williamsport, Pa., is said to be planning to make extensive improvements to its yards at Penn Yan.

The directors of the Catskill Traction Co., W. C. Wood, President, Catskill, have decided that immediate steps should be taken for the construction of an extension to Cairo.

The Fonda, Johnstown & Gloversville R. R., F. A. Bagg, Chief Engineer, Gloversville, is to erect an addition to its shops in Gloversville. The electrifying of a portion of the steam road and also of the adoption of a gasoline motor car on the branch line between Gloversville and Broadalbin has been postponed for this year. The board of directors has decided to defer electrifying the steam road between Johnstown and Gloversville, and will spend the money increasing the facilities of the Gloversville shops.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Committees have been appointed at Mt. Gilead, Mansfield and Marion to secure subscriptions for the surveys and reports on three proposed electric lines through Mt. Gilead. The attempt is being made to raise $5,000 for a comprehensive report on the possibility of constructing three roads: Mansfield, Mt. Gilead and Delaware; Galion, Mt. Gilead and Delaware; Marion, Mt. Gilead and Mt. Vernon. A. A. Whitney, Mt. Gilead; Benj. Waddell, Marion, and Charles Bechtel, Galion, O., are on the committee.

Capitalists of Campbell County, Ky., are reported to have offered a bonus to the Louisville, Lexington & Maysville Traction Co. to bring its line through the county, reaching Cincinnati by way of Newport.

The construction of an electric railway from Bellefontaine to Sidney, a distance of 22 miles, is proposed there. The line is also to be extended from Bellefontaine via West Mansfield and Marysville into Columbus. It is stated that the company has purchased the right of way between Bellefontaine and Sidney from the old Bellefontaine & Sidney Electric railway promoters, and that the work of constructing the road will start next month. H. F. Houghton, Indianapolis, Ind., General Superintendent of the Big Four Ry., and E. M. Costin, Cleveland, O., Division Superintendent, are reported to be interested.

The Toledo & Ohio Central Ry., D. C. Holtsberry, Division Engineer, Columbus, has had surveys made for a grade-crossing at Kenton. This will require about 1,500 ft. of new track and some line changes.

The Akron, Canton & Youngstown R. R., T. Z. Davie, President, Akron, has secured right of way between Akron and Magadore for its projected line, which is to be a steam road.

Surveys are underway for the proposed railroad from Jackson to Portsmouth. The proposed route leaves Jackson in the direction of Cove and passes near that point. It bears toward Mabee and passes near if not through Meldick's farm in Hamilton township, thence in the direction of Jackson Furnace to Sciotoville. W. H. Monahan, Jr., Jackson, O., is interested.

The Columbus, Urbana & Western Traction Co. of Columbus, is securing right of way for an extension of its line from Fishinger's Bridge, 8½ miles north of Columbus, to Dublin. The proposed extension is five miles long. Construction work may be started this fall.

Plans are under way for the extension of the Shaker Heights St. car line of the Cleveland Rys. Co., of Cleveland, two miles further out on the heights. The plan is to extend the line out Coventry Rd. from the intersection of Fairmount boulevard, as far as Attleboro Rd. This would call for four miles of new double track at an approximate cost of $150,000.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Business Men's Association of Perkins has accepted the proposition of L. J. Lampke, of New York City, mentioned in our last issue, to build an interurban railroad through that city. The association will give 40 acres of land and a $10,000 bonus.

The City Engineer's Department of Oklahoma City, as previously noted, is drafting plans and making drawings for a system of elevated railroad tracks in compliance with a recent request from the railroads entering Oklahoma City that a method whereby surface crossings may be eliminated be devised.

The Beaver Valley & Northwestern R. R., chartered in Oklahoma three years ago, to build a line from Oklahoma City to the Colorado coal fields, is reported to have made such progress with its promotion work that active construction will be started in Oklahoma this spring. A proposition has been made to the Commercial Club of Liberal, Kan., to locate a terminal at that city. J. M. Kerns, Sunset, Okla., is General Manager.

The Oklahoma City Junction Ry. Co., of Oklahoma City, which proposes to build a belt line in that city, connecting with the proposed packing house districts with the Katy and Rock Island lines, has filed amended articles of incorporation providing that offices shall be maintained in Oklahoma City and Chicago and fixing the capital stock at $1,000,000. The directors are: P. E. Wilson, C. C. McFarlane and E. F. Bisbee, of Chicago; D. T. Flynn, C. B. Ames and J. S. Agnew, of Oklahoma City.

The Okmulgee & Coalton R. R. Co., with principal offices at Okmulgee, has been chartered to build from Okmulgee to Coalton, at an estimated cost of $150,000. The company has a capital stock of $50,000, and the directors are: W. J. Cook, of Muskogee; C. S. Dawley, N. D. Boyd, T. J. Baker, Walter W. Martin, E. W. Gill, A. F. Seidler, Lee O. Voorhis, G. W. Mecklin, A. D. Kennedy, John A. Belford and R. D. Carpenter, of Okmulgee.

The Muskogee Transit Co. of Muskogee, recently organized by Muskogee and St. Louis capitalists, proposes the building and operating of a second electric street railway in Muskogee and constructing interurban lines to Tulsa, Sapulpa and intervening towns. It is planned to have the line in operation in the fall of 1911.

Engineers of the American Central Construction Co., F. P. Reed, President, are working between Olustee, Tex., and Vernon, Tex., on the proposed railroad to be built through Olustee.

The Chicago, Rock Island & Pacific Ry., A. B. Warner, District Engineer, Fort Worth, Tex., is to double the capacity of its yards in Oklahoma City. The additional tracks are to be placed in the eastern section of the city near the junction of the Rock Island and Missouri, Kansas & Texas lines and will extend for more than a mile to the east. The cost will aggregate $100,000.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Porter Bros., Spokane, Wash., have been awarded the contract by the United Rys. Co., of Portland, for the construction of a tunnel through the ridge of hills separating Willamette and Tualatin, three miles beyond Burlington. The tunnel will be 3,400 ft. long.

The Oregon Trunk Line Ry., John F. Stevens, President, Portland, will, it is said, let contracts May 1 for the construction of 130 miles of the new road penetrating central and southern Oregon. The contract will involve construction to cost between $4,000,000 and $5,000,000.

Porter Bros., Spokane, Wash., have the contract for the first 110 miles of the Oregon Trunk Line Ry., which has its beginning near Deschutes, on the south bank of the Columbia river. The contract runs to a point midway between Madras and Bend, Oregon. The next division mapped out calls for 130 miles of road which takes the system into the Klamath Lake country in southern Oregon.

The City Council of Springfield has accepted the bonds of the Lane County Asset Co., of Eugene, to build its electric line into the city within 24 months. Work is to start at once.

Citizens of Fossil have appointed a committee with James S. Stewart, Fossil, as chairman, to secure the construction of a railroad south from Condon, via Mayville to Fossil, a distance of 20 miles. Efforts will be made to have the Harriman officials extend the line from Condon to Fossil, and if this plan fails the citizens will build the line themselves.

The Portland Railway, Light & Power Co. is considering extending its Woodlawn car line at Portland from its present terminal at East 8th and Dekum to East 27th St.

Twohy Bros., Portland, Ore., have started work on their contract for constructing the Pendleton-Yoakum line, and have construction camps established along the 14 miles of road. The work will take about six or eight months to complete.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

John A. Kelly Co., Philadelphia, Pa., have work well under way on the contract for the Lehigh Valley R. R. to construct the roadway for four tracks between the lower Cata-

sauqua bridge and the Hokendauqua bridge. They will widen and build new abutments for the bridges, face the river with concrete walls and widen the roadbed between the two points requiring the entire summer to complete. The contract from the Gap bluff to the lower bridge is almost completed, a month's work of blasting at the bluff finishing the work. The four-track roadway along the river, from Allentown to Catasauqua is in place, and track laying will be done by the company.

The Somerset Street Ry. Co. has completed surveys and is arranging for the construction of its line connecting Somerset and Rockwood. The company is composed of Somerset capitalists.

The Allentown & Reading Transit Co. will rebuild its tracks on Walnut St., at Allentown from 12th to 17th Sts., as that street is to be paved.

Advices from Hanover state that construction work will probably be started at once on the projected electric railway between that place and Reisterstown, Md. The company has recently been chartered by the Maryland legislature and has a capital stock of $6,000,000. The construction of the line will require no heavy grading and there is only a few small bridges to be built. The incorporators named in the charter include James H. Wilson, Jacob A. Frederick Newton, S. Watts, John P. Bruce, Frank L. Hancock, Daniel F. Reiseweber and William L. Dietrich. The proposed route of the line is around or through Hampstead and Manchester, in Carroll County, and through Carroll County, in the state of Maryland, to the Maryland and Pennsylvania state line, and then in the state of Pennsylvania, to such points as its directors may determine.

A petition has been presented to councils of Williamsport asking that a franchise be granted the Williamsport Passenger Ry. Co. for an extension of its tracks on West Third St. to the West End for the accommodation, primarily, of the employes of the Sweets Steel Co.

The West Penn Rys. Co. is to expend $10,000 for straightening its Scottdale-Greensburg line at a point about three miles south of Mt. Pleasant. The road is also planning a line from Graham's crossing, Dunbar Township to Uniontown. Right of way for the greater part of the distance has been secured.

The Huntingdon, Lewistown & Juniata Valley Traction Co. has awarded contracts for the construction of its line from Mill Creek to Huntingdon and grading work is to be started at once. The contractors have erected shanties at Mill Creek for their laborers.

The York Rys. Co., of York, is considering the construction of a belt line in order to improve the service in the northwestern part of the city of York. It is proposed to build an extension to the Linden Ave. line on Carlisle Ave. and connect with the West York Ave., via Pennsylvania Ave. The improvement would require about one mile of new line.

The Blue Ridge Co. has been organized at Waynesboro with a capital stock of $15,000 for the purpose of building an extension of the Chambersburg, Greencastle & Waynesboro street railway from Pen-Mar to Blue Ridge Summit, a distance of four miles. The directors and officers are as follows: President, George B. Beaver; secretary, John G. Benedict; treasurer, W. B. Stottlemeyer; W. L. Minick, J. W. Wareheim, I. D. Sefton and J. C. Lane.

Construction work on the trolley line from Grove City to Slippery Rock is to be started shortly; the construction force for the work is reported as having been already secured by General Manager S. L. McClure of Grove City.

The New York Central & Hudson River R. R. has been rushing its third survey for its line from Franklin to Ellwood City.

Efforts are being made to interest capitalists of Blair and Huntingdon counties in the project of building a trolley line between Hollidaysburg and Huntingdon. The most desirable route between the capitals of the two counties seems to be by way of Frankstown, Canoe Creek, Point View, Williamsburg, Cove Forge, Carlim, Blair Four, Shaversville, Waterstreet, Alfarata Park, Alexandria, Petersburg and Shaver's Creek, a total distance of about 40 miles.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Indiana capitalists represented by E. L. Derryberry, of Dallas, are considering the construction of an interurban line between Dallas and Waco, which would pass through Waxahachie, Hillsboro and other towns on the most direct route.

The Texas & Pacific Ry., D. S. Wathen, Chief Engineer, Dallas, Texas, is to improve its roadbed and will, it is said, place several steam shovels at work on its eastern division.

Construction work is to be started this month on the projected line of the Quanah, Seymour, Dublin & Rockport R. R. The company is said to have been promised bonuses of over $1,000,000 for the new line which is to extend from North Texas to the coast, a distance of 700 miles. As projected the line will traverse the following counties: Hardeman, Wilbarger, Foard, Baylor, Throckmorton, Young, Stevens, Travis, Hamilton, Coryell, Burnet, Williamson, Caldwell, Conzales, DeWitt, Victoria and Calhoun. L. E. Walker, Austin, is President.

The North American Dredging Co., Galveston, has been awarded the contract by Galveston County for filling the causeway road from the Galveston city limits to the island end of the causeway site to 10 ft. The filling of the interurban right of way strip adjoining the county road is now under way by the same contractor and both jobs will be pushed to an early completion.

The Business League of Austin is considering a proposition of W. H. Caton, a railroad constructing engineer of Vinita, Okla., for the building of a railroad from Austin to Fredericksburg. According to preliminary plans it is proposed to form a construction company from people along the line to build the road, which will cost between $17,000 and $18,000 per mile.

The Dumont-Holmes Steel Concrete Co., of Chicago, Ill., whose propositions to replace the old dâm in the Colorado river with a new concrete structure, was accepted at a recent election, is planning to start work within 60 days. The proposed improvement will cost about $1,000,000.

The Stephenville, North & South Texas Ry. has been purchased by the St. Louis Southwestern Ry., and the line of the latter road will be extended to Gatesville, where a connection will be made. M. L. Lynch, Tyler, Texas, is Chief Engineer of the St. Louis Southwestern Ry.

A meeting of the stockholders of the Quanah, Acme & Pacific Ry., which at present has 43 miles of line, was held April 19 to take formal action on the plans to extend the line from Paducah southwest to El Paso, a distance of 425 miles. C. E. Ensminger, Quanah, is General Manager.

According to a statement at Austin of Edwin Hawley, chairman of the Board of Directors of the Missouri, Kansas & Texas Ry., plans have been adopted for double-tracking the main line between Dallas and Parsons, Kan., 380 miles. It is reported that the Missouri, Kansas and Texas will extend its San Antonio line south to Kingsville, about 160 miles, to connect with the Frisco's new line to Mexico. A. M. Acheson, Dallas, Tex., is Chief Engineer.

The Southern Lumber Co. is obtaining right of way for a road from a point in Caddo Parish, La., to Jefferson, Tex. While this road will be constructed primarily for the purpose of utilizing a large tract of timber which it will penetrate, it will also perform a regular freight and passenger service, it is stated.

The Charles Clarke Co., Galveston, has completed over 1,500 ft. of the base of the seawall being built at Fort Travis. This seawall is being built for the U. S. government and when complete will be 2,563 ft. in length, resting on round and sheet piling and in addition there will be a retaining wall to protect the filling of the reservation which will be 4,310 ft. in length.

The St. Louis, Brownsville & Mexico Ry. will extend the Buckeye spur seven miles, making a total length of sixteen miles for the spur, from the Tres Palacio's Rice and Irrigation Co. to Collegeport. E. C. Burgess, Kingsville is Engineer of Construction, S. L. B. & M. Ry.

The Atchison, Topeka & Santa Fe has started track laying on its line from San Angelo to Sterling City, 47 miles. It is stated that this line will be extended northwest from Sterling City to a connection with the Lubbock line of the Santa Fe.

The State Railroad Commission has authorized the Gulf Coast & Provident City Ry., Emil Reinbold, President, Kansas City, Mo., to issue $721,000 of stock and bonds. The line extends from Pierce to Waterhouse and thence to Provident City, a distance of 30¼ miles. The company is also planning 20 miles of extensions.

Advices from San Benito state that final contracts have been signed by the company that has undertaken to build an interurban railroad running from San Benito to the river below San Benito, a distance of about 17 miles, and Judge Campbell of Palestine, Tex., representing the firm that will furnish the rails and other equipment. The right of way for this road has already been cleared and men are now at work with scrapers building the grade. Surveyors are also busy staking off a right of way north of town to the sugar plantation of the San Benito Sugar Company, a distance of 14 miles. This extension will in all probability also be made, four-fifths of the bonus asked for the extension having already been subscribed.

The Missouri, Kansas & Texas Ry. will, it is said, have its own terminals in San Antonio within two years, when the contract with the Galveston, Harrisburg & San Antonio R. R. for the use of its tracks will expire. It is also said that the directors of the Missouri, Kansas & Texas will consider a proposition to extend the railroad south to connect with the St. Louis, Brownsville & Mexico R. R.

F. B. Truax, Chief Engineer of the Gainsville, Oklahoma & Western R. R., started surveys from Gainesville early this month on the projected line which is to be built from that city to Bridgeport in Wise county, via Decatur.

Eight men were instantly killed and three men badly injured on April 10 by the premature explosion of a heavy charge of dynamite in a construction camp on the Texico extension of the Santa Fe, 22 miles northwest of Coleman. The accident occurred at a point 2 miles from Novice on a road the Santa Fe is building from Coleman to Lubbock. The men were working in a deep cut right at the Jim Ned creek. Only blasting work is done on Sunday and most of the workmen, numbering more than 200, were in camp, 200 yards distant from the mine of powder. The workmen were just finishing their midday meal and only fourteen had returned to the cutoff when the explosion occurred. The cut is 34 ft. deep and required the removal of 110,000 yds. of solid rock. It is thought that one of the workmen in tamping a charge struck a dynamite cap, which touched off the 1800 lbs. of explosive.

The Texas North & South Ry. has surveyors in the field working north and south from Coleman for the projected line through Throckmorton, Shackelford, Callahan, Coleman, McCulloch, Mason, Gillespie and Comal counties. The line is to be constructed from Vernon, on the Fort Worth & Denver, to San Antonio, a distance of 360 miles. J. E. Boog-Scott, Coleman, is interested.

The following have been elected officers of the San Antonio, Rio Grande & Tampico R. R., now building from San Antonio to Brownsville, with an ultimate terminus at Tampico, Mexico: George W. Nock, New York, chairman of the board of directors; A. B. Hedden, New York, president; H. H. Aubrey, San Antonio, first vice president; W. H. Cullen, San Antonio, second vice president; A. L. Matlock, San Antonio, third vice presi-

dent; H. C. King, Jr., secretary; J. H. Hale, treasurer.

Kahmann & McMurry, 709 Sharp Bldg., Kansas City, Mo., have been awarded the contract for the grading work on the Menard end of the Frisco and will start work this month. **The Frisco is pushing the building** of bridges and culverts on the first 17 miles out of Brady and will begin laying steel about June 1. It is the intention to have the road in operation to Menardville by Jan. 1.

The charter of the Quanah, Seymour, Dublin & Rockport Ry. Co. was approved on April 13. This line is to commence at or near the northwestern corner of Hardeman county, on the south bank of the Red River, to proceed thence through Hardeman, Foard, Wilbarger, Baylor, Throckmorton, Young, Stephens, Palo, Pinto, Eastland, Erath, Comanche, Hamilton, Coryell, Bell, Williamson, Travis, Bastrop, Caldwell, Gonzales, Lavaca, De Witt, Victoria, Goliad, Refugio and Aransas counties and through the cities of Quanah, Seymour, Dublin and Austin terminating in Rockport. The home office is to be in Austin, and the capital stock is $500,000. The incorporators are: L. E. Walker, W. R. Davie, H. P. Faefflin, F. P. McLaughlin, Charles Rogan, George Mendell, Jr., H. E. Ford, Harry Koch, P. A. Whaley, Will L. Vining and A. J. Eilers.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ogden Rapid Transit Co., Ogden, has applied to the County Commissioners for a franchise for a change of its line from North Ogden to Hot Springs. The company intends to reconstruct a portion of its Hot Springs line to avoid a number of heavy grades between North Ogden and the resort.

A considerable amount of work has been secured by Springville contractors and over 300 men and teams will leave that place this spring to engage in railroad and canal building. Among those who have secured contracts are: H. T. Reynolds & Co., Crandall Bros., R. Palfreyman, Nephi Straw & Co., Deal Bros. and the Ely Construction Co.

The Tooele Valley R. R. Co., of Tooele, has petitioned the City Council for an extension of one year in which to electrify the road to the Salt Lake Route tracks.

Such progress has been made in reconstructing the track of the Salt Lake R. R. in the washed out section in Nevada, that it has been announced that the line would be open to through traffic on July 1. From the western end the track has been relaid to a point beyond Galt, while the eastern construction force has passed Caliente.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys for the route for the projected electric railway from Fredericksburg, Va., to Washington, D. C., have been completed to a point 12 or 14 miles north of Stafford Courthouse. The line is to be built in connection with the Richmond & Chesapeake Bay Ry., of which Wm. Northrop, Richmond, Va., is General Manager.

The Norfolk & Portsmouth Belt Line R. R., L. E. Johnson, Vice President, Norfolk, Va., is reported to be planning to extend the line across the Eastern Branch of the Elizabeth River into Norfolk proper, and continue it to Sewells Point, terminal of the Virginian Ry.

The Old Dominion Development Co., coal producers, Mutual Bldg., Richmond, Va., have purchased the old Clyde line wharf in Fulton, and will spend $100,000 in putting the wharf in shape for the purpose of handling coal from railway cars to river steamers and barges. Joseph W. Woolfolk is President of the Old Dominion Development Co.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Snohomish has granted a 25-year franchise to the Seattle, Snohomish & Everett Ry. Co., to build, equip and operate an electric railway over the streets and avenues of that city. The franchise provides that actual construction shall be begun within one year, and that the road shall be in actual operation within two years.

The Stone & Webster Engineering Corporation will have work started shortly on the proposed Bellingham-Skagit County Interurban Ry. The corporation is also planning a number of improvements in Bellingham and vicinity, to include an auxiliary power plant. S. L. Shuffleton, Sunset Block, Bellingham, is Constructing Engineer.

The North Coast R. R., F. L. Pitman, Chief Engineer, Spokane, Wash., is securing right of way and, it is believed, that active construction work on the line through Walla Walla will be started soon.

H. C. Henry, Seattle, has begun work near Moncton on the construction of the first six miles of track on the branch line of the Chicago, Milwaukee & Puget Sound, between Moncton and Everett. Right of way for the remaining distance of the branch has been over 60 per cent secured.

The H. M. Byllesby Co., of Chicago, Ill., is reported to have started surveys for its projected interurban line from Walla Walla to Pendleton. After the survey between Walla Walla and Pendleton is completed, it is said the line will be projected through to La Grande.

Construction work on the North Coast Ry. in Washington has been making good progress although the contractors are somewhat handicapped by the scarcity of labor. Tribble & Anderson, who have the first 8 miles out of Cheney have been working between 600 and 700 men in three general camps and in three camps under sub-contractors. They are also employing station men. Washtok & Chew, who have the next 12 miles of line, have been working between 900 and 1,000 men. They also have a contract at Silver Hill for the North Coast, and are working two camps of men, and have there 150 men in these two camps, called camps 5 and 7. Carlson & Chindahl, contractors for the North Coast out of Sprague, are working 500 men and have other contracts to start as soon as they can get the laborers. They have also had to resort to subletting and station work in order to hasten their job. They are just finishing a large job on the Northern Pacific cutoff at Adrian, Wash., and just as soon as this is finished, about May 1, intend to move their entire force to Sprague on the North Coast work.

The Tacoma Railway & Power Co., L. H. Bean, General Manager, Tacoma, will expend about $200,000 this year for improvements underway or ordered. Of this sum $65,000 will be expended for raising the trestle which runs along Puyallup Ave. on the interurban line at Tacoma.

The Northern Pacific Ry., W. L. Darling, Chief Engineer, St. Paul, Minn., has given notice to agents of all property along the south end of Lake Union in Seattle to remove buildings and obstructions in order that work may be started at once on construction of the four-track belt line around the lake. Under three franchises granted to the Northern Pacific, covering the territory between Ballard and Fremont, around the south end of Lake Union from Fremont to Hamlin St. and on Terry Ave., between Valley St. and Denny Way, the company is required to finish work on the Lake Union section within twelve months after Westlake Ave. has been improved by Seattle. Bids for this improvement have been called for and will be opened within three weeks. It now looks as though the Northern Pacific will not wait for this improvement to be finished, but will pursue its work coincident with that of the city, in order to place tracks in position by the time municipal operations are completed.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chippewa Valley & Northern Ry., J. Z. Arpin, Manager, Atlanta, Wis., has started surveys for an extension which, according to reports, will be built from Bruce, Atlanta and Exeland in a northeasterly direction to Radisson. Motor car passenger service has already been inaugurated between Bruce and Exeland and work of grading will be started at Exeland.

The Common Council of Oconomowoc has granted the Milwaukee Light, Heat & Traction Co. a franchise for an electric railway in the city. The road will be an extension of the line planned from Milwaukee.

Surveys have been made and work will soon be started on the dam which the Arpin Hardwood Lumber Co., D. J. Arpin, President, Grand Rapids, Wis., will put in on the Chippewa River north of Bruce. The company has several franchises along the river and expect to put in several mills and dams.

The Minneapolis, St. Paul & Salt Ste. Marie Ry., Thos. Green, Chief Engineer, Minneapolis, Minn., will spend $1,000,000 this season in completing its terminal improvements at Superior. These will include a new ore dock on St. Louis Bay, contract for which will be let shortly, and the enlargement of the car yards.

Work is to be started immediately on the building of the projected roads of the Sparta-Melrose Electric R. R. Co. A St. Paul financier has agreed with the officers of the company to build the road and lease it to the Chicago, Milwaukee & St. Paul Co. The first eleven of the 28 miles will be built this summer.

Wyoming Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago & Northwestern Ry., E. C. Carter, Chief Engineer, Chicago, Ill., is reported to be planning to have work started this summer on a branch railroad from Whaba, near Riverton, up the Wind River Valley to Crowhart. The proposed line is about 75 miles long up a fertile valley with water grade.

Construction work on the dam of the Park Reservoir Co., 25 miles southwest of Sheridan, Wyo., has been in progress all winter and the work is about 75 per cent completed. The dam will create a reservoir that will cover 260 acres, which will be covered with water to an average depth of 29 feet. E. C. Bowman, Sheridan, Wyo., is Superintendent of the Park Reservoir Co.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The House of Commons Railway Committee has passed the bill to incorporate the Montreal Kapitachuan & Rupert's Bay Ry. Co., which proposes to build a line from Montreal to Rupert's Bay, on Hudson's Bay, a distance of 450 miles.

The Railway Committee of the House of Commons has passed the Ottawa, Rideau Valley & Brockville Railway bill. The company owns mines near Ironsides and proposes a line down to Hull. From there it would use the interprovincial bridge and the Grand Trunk out to Graham's Bay, branching off thence and running as an air line through Carleton, Grenville and a part of Leeds Counties to Brockville.

The Canadian Northern Ry. has awarded contracts for extensions in Saskatchewan and Alberta totalling 230 miles. Half of the contract on the Maryfield extension and the Moose Jaw extension was awarded to the Cowan Construction Co. Winnipeg, the balance of the work at the Maryfield extension being awarded to the Northern Construction Co., who also secured the work for grading on the Vegreville extension to Calgary and on the Goose Lake line extension.

Financial aid has been asked from the Provincial Government of New Brunswick for the proposed extension of York & Carleton (Stanley Branch) Ry. from Ryan's Brook to meet the Grand Trunk Pacific at Nappadogan Lake, the divisional point. This proposed extension is about nine miles in length, and it is understood that financial arrangements have been made for carrying on the work if certain assistance is given. Dominion subsidies will lapse in July next, and a bond guarantee

of $10,000 per mile is asked from the Provincial Government. It is stated that arrangements which have been in progress for some time for taking over of the York & Carleton Ry. by the Dominion Government as a branch of the Intercolonial or Transcontinental Ry. are about completed.

The Montreal Harbor Commissioners, Montreal, have ordered a new plant, costing about $250,000. This plant consists of a twin-screw tug, a land excavator built by the Browning Co. of Cleveland, O., and the hull and boiler for a dredge. This is the first expenditure from a $6,000,000 loan. F. W. W. Cowie, Montreal, Que., is Harbor Engineer.

The Temiskaming & Northern Ontario Ry., S. B. Clement, Chief Engineer, North Bay, Ont., has perfected plans for a number of improvements and extensions. Contracts are also to be let shortly for the construction of new steel bridges. The double tracking of an additional portion of the road, as well as the erection of several new stations is also proposed.

The Canadian Northern Ry. has completed the survey of its route to Niagara Falls, Ont. The route runs along the right-of-way of the Toronto & Niagara Power Co. to the city line, through the heart of the city, crossing the river on a bridge to be built 300 ft. north of the upper steel arch bridge.

The Niagara, St. Catharines & Toronto Ry., owned by Mackenzie & Mann interests, will build a line to Fort Erie during the coming summer, forming a belt line through the Niagara district as a feeder for the Canadian Northern.

The Essex Terminal Ry. Co. is planning to build a spur at Windsor, Ont., from its interswitching line to tap the district along McDougall St., which the city proposes to lay out in factory sites this year. William Woollett is General Manager.

A bill has been before the House of Commons to incorporate a company with power to construct a canal from 7 to 9 ft. deep and 40 ft. wide connecting Lake Superior with Lake Winnipeg. The proposed waterway will cost, it is estimated, about $20,000,000 and will develop 1,000,000 H.P., part of which will be available for consumers in Michigan and Wisconsin. The promoters are said to have $20,000,000 available for the enterprise and as soon as the bill is passed engineers will be sent out to make a survey preparatory to construction. J. H. Horne, Fort William, Ont., is interested.

City Engineer Rust of Toronto, Ont., has made a report on the question of requesting the Toronto Ry. Co. to build lines to the North, Northwest and Northeast sections of the city.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The United Railways of Yucatan has obtained a loan from the Banco Nacional de Mexico of Mexico City for $4,000,000 gold. The money will be used to build an extension and to improve the physical condition of the existing property.

Among the concessions covering the use of river waters for the generation of power and for irrigation purposes recently asked of the Department of Formento, of the Mexican Government, are the following: 10,000 liters, per second, from the arroya de Mimbre, in the state of Coahuila, have been requested by Messrs. Gil and Franco, for irrigation purposes; Manuel Miravet has asked for the use of a portion of the waters of the Rio Quiotepec, in the state of Oaxaca, also for irrigation; Guadalupe Gonzalez has an irrigation project in the territory of Tepic, which will require the use of several thousand liters of water per second, from the Rio Acaponta; a large power proposition, in the state of Michoacan, which will require 20,000 liters, per second, is the basis of a concession asked for by George Pinson, the water to come from the Zitacuaro, San Francisco and Enandio rivers.

The National Railways of Mexico has given the Monterey Steel & Iron Co. another large order for steel rails and bridge material, aggregating about $2,000,000. Part of the rails will be used to construct the extension which the National is building from Durango southwest toward Mazatlan. The extension already under contract is 65 miles long.

W. J. Irwin & Son, Roswell, N. Mex., have about completed work on their contract for constructing a concrete dam for the Acme Irrigation Co., one mile north of Hagerman, N. Mex. Plans for the dam were made by Reed & Wilson, Roswell, N. Mex., and construction work was started Jan. 25 and will be completed by Apr. 25. The dam is 174 ft. long and contains 1,120 cu. yds. of concrete.

As originally planned in the minority report of the International Board of Engineers which was adopted by Congress the construction of the Panama Canal required a total excavation of 103,795,000 cu. yds. Changes in the plan made subsequently by order of the President added 70,871,594 cu. yds., making the total excavation required 174,666,594 cu. yds. At the end of March the grand total of excavation accomplished amounted to 103,205,666 cu. yds. or within 590,004 cu. yds. of the total excavation required by the original plan. The amounts excavated and remaining to be excavated at the beginning of April were as follows:

	Amount Excavated cu. yds.	To be Excavated cu. yds.
Atlantic Division:		
Dry excavation....	6,791,280	2,770,631
Dredges	17,574,566	15,940,831
Central Division:		
Culebra Cut.....	45,624,605	32,417,690
All other points...	8,655,533	3,096,665
Pacific Division:		
Dry excavation....	2,714,211	3,216,369
Dredges	21,845,469	14,018,742
Grand totals.....	103,205,666	71,460,928

City Engineer Wagner of Sioux Falls, S. Dak., has been granted a 30 days leave of absence by that city in order to run the preliminary line for the Sioux Falls & Western Ry. Co., which proposes constructing a railroad from Sioux Falls to Wheeler, on the Missouri river in Charles Mix county. The line probably will strike Parker or Marion Junction on its route toward the southwest.

The engineering force on the Pingree-Wilton extension of the Northern Pacific has established its headquarters at Pingree and is setting the grade stakes preparatory to having grading started.

The Iowa & Dakota Interurban R. R. Co., of Yankton, S. Dak., the incorporation of which was mentioned in these columns recently, is reported to have secured considerable capital for the undertaking. As proposed the line will extend northwest from Sioux City through Woodbury and Plymouth counties, Iowa, and then passes through Union, Clay, Yankton, Turner, Hutchinson, Hanson and Davidson counties, into Mitchell. The board of directors of this company are as follows: B. E. Wells, E. E. Mamford and H. E. Valentine of Centerville; L. F. Phillips and W. G. Kirkpatrick of Wagner, and Albert Abundson of Lake Andes.

The City Council of Clarksville, Tenn., has granted a franchise to the Clarksville & New Providence Street Ry. Co., giving it the right of way over North Second st., to the city limits. It is the purpose of the company to connect Clarksville and New Providence with a car line.

The White Mountain Paper Co. is preparing to expend $1,500,000 on its plant at Portsmouth, N. H.

It is reported that parties connected with the Carnegie Steel Co., will this summer, start the development of a hydro-electric project in the neighborhood of Indian Lake, Me. The plan contemplates the building of a dam below Indian Lake, which will raise the level of the lake 125 feet, flood 56,000 acres of land, and develop 90,000 H. P. The estimated cost is about $9,000,000.

The Sanford Traction Co., of Sanford, Fla., which now has seven miles of line in operation, will extend its road so as to belt the city and take in the West Side.

The construction of a railroad from Loup City to Broken Bow, Neb., is proposed. Walt George and Frank M. Currie, of Broken Bow, Neb., are interested.

The City of McComb, Miss., has granted a franchise to W. M. White and J. J. White, of McComb, owners of the Liberty White Steam R. R., to put in a complete electric street car line, covering the principal business streets of the city, starting from the Liberty-White depot in South McComb, and traversing the west, northern and central portions of McComb.

The Memphis Street Ry. Co., Memphis, Tenn., has asked the County Court for permission to extend its Main St. line, New Raleigh road division, from the present terminus on the New Raleigh road, to a point 7,500 ft. farther east.

W. J. Oliver & Co., Knoxville, Tenn., has been awarded the contract for constructing the electric railway of the Greenville & Spartanburg Electric Ry. Co. The line is to extend from Greenville to Spartanburg, S. C., and the contract just let is said to amount to $750,000. H. H. Prince, Greenville, S. C., is General Manager.

Dominick Rich, Clarksburg, W. Va., has begun work on his contract for extending the West Virginia Midland R. R. up Black Fork and Elk river through the Camden and Johnson lands, the timber on which is being operated by the Belle-Meade Lumber Co., a distance of five miles to Skelt, W. Va.

The J. T. Stevens Contracting Co., Beatrice, Neb., has started work straightening the channel of Indian creek, west of town, for the Chicago, Burlington & Quincy Ry. A 50-ft. channel will be cut, shortening the course of the creek about a half a mile. This is done to stop damage by high water.

Samuel Ferguson has begun work at Marston's Corner, Me., on his contract for constructing the Portland, Gray & Lewiston Electric Ry., of which W. Scott Libby, Lewiston, Me., is President. The construction of the road will be continued from this point towards Portland, and it is expected that the roadbed, bridges and culverts will be all built this year, and the road will be running by a year from next June.

The New York, New Haven & Hartford R. R., Edw. Gagel, Chief Engineer, New Haven, Conn., has decided to proceed with plans to double-track the Air Line from New Haven to Boston and to construct the through route from New York to Sherbrooke in the Province of Quebec. The proposed new route from New York to Sherbrooke, Canada, is to be made possible by closing two gaps. One is between Brattleboro, Vt., and South Vernon, Vt., and the other between Windsor, Vt., and White River Junction, Vt. The proposed route lies over the New Haven road from New York to Springfield, and then over the Boston & Maine from Springfield through Brattleboro and White River Junction.

The Baltimore & Ohio R. R. is reported to have decided to build an extension from Lost Creek to West Milford, W. Va., in Harrison County. The extension will be about 15 miles long and will open extensive coal lands. It will connect with the West Virginia & Pittsburg Division of the Baltimore & Ohio.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Ft. Morgan, Colo.—Until noon, April 30, by Charles W. Comstock, state engineer, Denver, Colo., for the fabrication and construction of a pile-trestle highway bridge across the Platte River at or near the point where division line between ranges 58 and 59 crosses the river, in Morgan county, Colorado. Certified check for $300 required with bid.

Highland Park, Ill.—Until 8 p. m., April 21, by Board Local Improvements, for constructing reinforced concrete bridge.

Indianapolis, Ind.—Until 10 a. m., April 23, by Albert Sahm, county auditor, for the construction of a culvert over ditch, north line Section 15-15-5, Warren township; culvert over Moore ditch, on Copeland Road, southeast quarter of Section 24-14-4, Franklin township, and a retaining wall at west end of bridge over Buck Creek, on north line of Section 15-15-5, Warren township.

Princeton, Ind.—Until 11 a. m., May 4, by W. T. Roberts, county auditor, for the construction of 11 steel bridges and 14 reinforced concrete bridges.

Kansas City, Kan.—Until 2 p. m., April 25, by Kaw Valley Drainage Board, W. H. Daniels, president, for furnishing materials and the construction along the Santa Fe ditch, Argentine, Kansas City, Kan., of about 460 lin. ft. of reinforced concrete culvert, of approximately 9 ft. sq. section, and containing about 830 cu. yds. of concrete.

Topeka, Kan.—Until noon, April 22, by S. G. Zimmerman, County Clerk, for constructing 188-ft. steel span on north end of bridge over the Kansas River, near Willard.

Ypsilanti, Mich.—Until noon, May 16, by S. Damon, city clerk, for the construction of a 3-arch reinforced concrete bridge over the Huron River. Bridge is to be 225 ft. long, with a 46-ft. width. Official advertisement will be found elsewhere in this issue.

Lexington, Miss.—Bids are being asked by Peckham Williams, clerk County Supervisors, for building a wooden bridge on Durant Turnpike leading to Big Black River.

Monticello, Miss.—Until May 2, by W. H. Speights, Clerk County Supervisors, for construction of a steel bridge over Silver Creek, on Mt. Carmel Road.

Winnemucca, Nev.—Until 2 p. m., May 3, by the County Clerk, for constructing reinforced concrete bridge over the Humboldt River in Winnemucca; also two reinforced concrete culverts in the same town.

Cleveland, O.—Until 11 a. m., May 14, by John F. Goldenbogen, clerk County Commissioners, for the construction of bridge work per report No. 2570, Embankment, Barrett Road, Olmsted township. Frank R. Lander, county surveyor.

Dayton, O.—Until noon, April 22, by Department Public Service, Wm. A. Budroe, secretary, for all labor and material necessary to build a hand-power lift bridge of steel construction, wooden floor, over the Miami and Erie basin extension canal at Webster St., Dayton, together with the necessary foundations therefor. Bridge is to provide a 40-ft. waterway and a 10-ft. towing path, and is to be 24 ft. wide. F. J. Cellarius, city civil engineer.

Sherman, Tex.—Until May 2, by Barney C. Kreager, city secretary, for constructing a concrete arch or steel span with concrete abutments. Bridge is to have minimum span of 40 ft. in clear and minimum width of 22 ft. in clear.

Elkins, W. Va.—Until May 6, by F. A. Rowan, Clerk, County Clerk, for constructing bridge over Cheat River.

New London, Wis.—Until 8 p. m., May 3, by N. R. Deming, City Clerk, for material and construction of a concrete bridge on the Embarrass River on St. Johns Pl. Part of plans and specifications are on file with City Clerk. Bidders are expected to furnish their own plans and specifications.

Ellice, Man.—Until May 7, by Henry Tillman, Secretary-Treasurer Ellice Municipality, for building a bridge over Assiniboine. Plans, etc., at office of Department of Public Works, Winnipeg.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Logan, Colo.—Until 10 a. m., April 28, by Capt. Chase Doster, Quartermaster, U. S. A., for the material and labor required in the alterations and repairs to post hospital here. Work includes brickwork, plastering, painting, plumbing, etc.

Washington, D. C.—Until 2 p. m., April 21, by the District Commission, 427 District Bldg., for constructing an addition and making alterations to Bennings School No. 48, square 5053, Anacostia Road N. E.; constructing a 4-room addition to the Lovejoy School Building, No. 124, northwest corner 12th and D Sts. N. E., and for constructing a 2-room School Building, No. 161, on Bunker Hill Road, Brookland, D. C.

Perry, Fla.—Until 2 p. m., May 2, by John C. Calhoun, Clerk, County Commissioners, for erection of a new brick jail, complete, at Perry. Certified check for $500 required with bid.

Knoxville, Ia.—Until noon, April 23 by J. H. Power, for the erection of a 2-story brick business house, 20x120 ft.

Brookville, Ind.—Until 1 p. m., May 12, by the County Auditor, for the repair of court house; also bids for heating, plumbing and electric work.

Greensburg, Ind.—Until 10 a. m., April 30, by E. L. Meek, trustee Clinton Township, Decatur County, at law office of Wickens & Osborn, Greensburg, Ind., for the construction of a 2-story brick school house in Sandusky, Ind.

Kokomo, Ind.—Until 3 p. m., May 20, by James Knox Taylor, supervising architect, Washington, D. C., for the construction, complete (including plumbing, gas piping, heating apparatus, electric conduits and wiring), of the U. S. post office at Kokomo, Ind.

Seymour, Ind.—Until noon, May 3, by Board of School Trustees, W. J. Durham, president, for construction of a new High School Building, including plumbing, heating and electric wiring.

Lawrence, Kan.—Until 2:30 p. m., April 28, by Regents University of Kansas, Edw. E. Brown, secretary, for all labor and materials, and the erection of the first wing of an Administration Building and College of Liberal Arts and Sciences, on the campus of the University of Kansas, at Lawrence, also for the furnishing of all labor and materials for the complete installation of a system of heating and plumbing in said building. Plans with Charles H. Chandler, state architect, Capitol Bldg., Topeka, and at the office of M. P. McArdle, architect, Chemical Bldg., St. Louis, Mo.

High Point, N. C.—Until 3 p. m., May 17, by James Knox Taylor, supervising architect, Washington, D. C., for the construction complete (including plumbing, gas piping, heating apparatus and electric conduits and wiring) of the U. S. Post Office at High Point, N. C.

Wentworth, N. C.—Until noon, May 12, by J. T. Holland, Clerk County Commissioners, for furnishing the materials and erecting a jail in accordance with the plans and specifications prepared by Architects Wheeler & Stern, Charlotte, N. C.

Portsmouth, N. H.—Until 11 a. m., May 21, by the Bureau of Yards and Docks, Navy Department, Washington, D. C., for rebuilding and fireproofing building No. 20, U. S. navy yard, Portsmouth, N. H.

Brooklyn, N. Y.—Until 11 a. m., April 27, by Alfred E. Steers, Borough President, for furnishing all the labor and materials required for making repairs and alterations to the four free floating baths in the borough of Brooklyn. Security required is $1,400.

Brooklyn, N. Y.—Until 11 a. m., April 25, by C. B. J. Snyder, Superintendent of School Buildings, Park Ave. and 59th St., New York, for alterations, repairs, etc., at public schools 16, 19, annex 22, 23, 33, 37, 49, 50, 51, 59, 71, 122, 126 and Eastern District high school, borough of Brooklyn.

Fort Terry, N. Y.—Until 10 a. m., May 13, by Capt. F. T. Arnold, Constructing Quartermaster, New London, Conn., for the construction, plumbing, heating, electric wiring and fixtures of one guard house and one quartermaster's store house at Fort Terry. Official advertisement will be found elsewhere in this issue.

New York, N. Y.—Until 11 a. m., April 25, by C. B. J. Snyder, Superintendent of School Buildings, Park Ave. and 59th St., for alterations, repairs, etc., at Public Schools 6, 18, 49, 53, 59, 70, 73, 74, 76, 77, 82, 96, 116, 117, 135, 158, 183 and 190, borough of Manhattan; also for alterations, repairs, etc., at Curtis High School Athletic Field, Curtis High School, and Public Schools 1, 14, 17, 18, 20 and 23, borough of Richmond.

New York, N. Y.—Until noon, April 26, by Calvin Tomkins, Commissioner of Docks, for furnishing all the labor and materials required for reconstructing and repairing the ferry structures at the foot of East 23d street, East River, borough of Manhattan. Security required is $4,000.

West Point, N. Y.—Until noon May 16, by the Quartermaster, U. S. A., West Point, for supplying the U. S. Military Academy with building materials, plumbing materials, gas and steam fittings, hardware, paints, etc., during the fiscal year ending June 30, 1911.

Fort Crockett, Galveston, Tex.—Until 2 p. m., May 20, by Capt. P. Whitworth, Constructing Q. M., for the construction, plumbing, heating and electric wiring of eight sets of officers' quarters, the construction of two storehouses, two shops and a fire station, all of reinforced concrete, and the construction of a coal shed, frame.

Stamford, Tex.—Until noon, May 2, by Elliott & Meredith, supervising architects, Stamford, for the erection of M. E. Church, South, at Stamford, according to plans and specifications prepared by Flanders & Flanders, architects, Dallas, Tex.

Fort Monroe, Va.—Until 10 a. m., May 11, by Capt. Ernest R. Tilton, Constructing Quartermaster, for the construction, including plumbing and electric wiring and fixtures of a detachment barracks, at Fort Wool, near Fort Monroe.

Elkins, W. Va.—Until 3 p. m., May 9, by F. A. Rowan, Clerk of County Court, for erection of a jail building and jailer's residence. B. F. Smith, Architect, 817 14th St., Washington, D. C.

North Yakima, Wash.—Until 3 p. m., May 26, by James Knox Taylor, supervising architect, Washington, D. C., for the construction, complete (except elevator), including plumbing, gas piping, heating apparatus, electric conduits and wiring of the U. S. post office at North Yakima, Wash.

Milwaukee, Wis.—Until 10:30 a. m., April 23, by Board of Public Works, Charles J. Poetsch, chairman, for furnishing all the material and doing all the work necessary and required to do the work of installing new shower bath and toilet room partitions, tiling walls in first story and laying new cement floors in first story of natatorium in toilet rooms in the Northwest Side Natatorium on the corner of 16th St. and North Ave.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Phoenix, Ariz.—Until April 25, by Robert A. Craig, Secretary Board of Control, for constructing 13 miles of territorial highway between Prescott and Phoenix.

Palatka, Fla.—Until Apr. 26, by Board of Trustees for Putnam County Bonds, S. Worden, Clerk, 722 Water St., Palatka, for the construction of hard-surfaced road from city limits of Palatka to Bostwick, Fla., a distance of 10 miles. R. F. Ensey, County Engineer, Palatka.

Fort Dodge, Ia.—Until 5 p. m., May 2, by Mayor S. J. Bennett, for the construction of about 70,000 sq. yds. of asphalt pavement on 5-in. concrete base (1 in. border and 1½ in. wearing surface) and about 35,000 lin. ft. of Portland cement combined curb and gutter. Official advertisement will be found elsewhere in this issue.

Anderson, Ind.—Until 10 a. m., May 3, by William T. Richards, county auditor, for grading and paving a road with brick.

Brookville, Ind.—Until noon, May 12, by the County Auditor, for constructing a public highway.

Bloomfield, Ind.—Until 2 p. m., May 3, by Peter M. Cook, county auditor, for constructing a gravel road in Center township.

Bloomington, Ind.—Until 2 p. m., May 4, by Horace Blakely, county auditor, for the construction of a pike in Bloomington township.

Brownstown, Ind.—Until 1:30 p. m., May 3, by H. W. Walker, county auditor, for constructing a gravel road in Washington township, 28,000 ft. in length.

Danville, Ind.—Until 10 a. m., May 2, by Wm. H. Nichols, county auditor, for constructing two roads, one 2,000 ft. long in Center township, and the other 10,605 ft. long in Liberty township.

Fairmount, Ind.—Until 2 p. m., May 3, by A. G. Stout, county auditor, Marion, for improvement of a street in the town of Fairmount by grading and paving with brick.

Jeffersonville, Ind.—Until 11 a. m., May 23, by Peter Narchand, county auditor, for constructing a gravel road 5.88 miles long.

Kentland, Ind.—Until 2 p. m., May 23, by E. R. Bringham, county auditor, for the construction of a system of macadam roads in Washington township.

Madison, Ind.—Until 1 p. m., May 3, by G. F. Crozier, county auditor, for constructing 6.64 miles long gravel road in Smyrna township.

Monticello, Ind.—Until noon, May 3, by A. G. Fisher, county auditor, for the construction of a stone and gravel road in Big Creek township.

Monticello, Ind.—Until noon, May 3, by A. G. Fisher, county auditor, for the construction of four gravel roads in Liberty township.

Salem, Ind.—Until 1:30 p. m., May 2, by Sam G. Ellis, county auditor, for constructing a road 4,000 ft. long in Madison township.

Sullivan, Ind.—Until noon, May 4, by Ben C. Crowder, County Auditor, for the construction of 7,939 ft. of stone road in Curry Township.

Terre Haute, Ind.—Until 11 a. m., April 23, by N. G. Wallace, county auditor, for the construction of one gravel road in Honey Creek township and three gravel roads in Fayette township.

Vincennes, Ind.—Until 2 p. m., May 3, by John T. Scott, county auditor, for the construction of 8,140 ft. of gravel roads in Vigo township, 8,050 ft. of gravel roads in Widner township and 9,383 ft. of gravel roads in Decker township.

Williamsport, Ind.—Until 1 p. m., May 6, by Robt. L. Winks, county auditor, for the construction of a gravel road in Steuben township.

Grand Forks, N. Dak.—Until 2 p. m., May 6, by Hans Anderson, county auditor, for grading and repairing about four miles of county road, running from Grand Forks city limits in a northwesterly direction toward Walsh county line, near Ardoch, N. Dak.

Bethlehem, N. H.—Until 10 a. m., April 29, by H. C. Hill, state engineer, Concord, N. H., for constructing one mile of road in this town, surfaced with native stone.

Cincinnati, O.—Until noon, April 29, by County Commissioners, Fred Dreihs, clerk, for the following county work: Under Specification No. 22, for improvement of the Hamilton Pike, from

A Noteworthy Series of Articles on Electric Railway Operating Costs.

Before the day of Wellington there were probably few civil engineers who fully appreciated the necessity of knowing in detail the cost of operating railways. The engineer who designs a structure or plant is rather prone to concentrate his attention upon the construction features to the neglect of the operating and maintenance costs. Wellington did much to change this tendency among railway engineers, but much yet remains to be done. The civil engineer who is called upon to locate and design an electric railway is still apt to approach the problem with a defective knowledge of the costs of operation. If the soundness of this statement is doubted, consult any of the books on street and electric railway design and construction. Even the one that makes the bravest attempt at introducing the economies of operation is full of blunders relating both to construction costs and to costs of operation. We refer to the work by Gotshall. Moreover, it is lamentably weak in data of operation.

Believing that the publication of costs of operating electric railways will prove of great assistance to engineers engaged in railway work, we have begun a series of articles on this subject, the first of which appeared in our issue of April 13, and gave the detailed cost of operating the New York Subway. In our issue of April 20 the cost of operating the elevated railways of Manhattan was given.

In this issue we give the cost of operating 69 miles of surface railways in Long Island City, and we shall follow with a series of similar articles relating to other lines and systems.

In comparing these actual costs with the estimated costs given in various books, one is struck with the large number of items that engineering authors have omitted entirely. Again, it frequently has happened that the actual data quoted by authors have been data of new lines, where the maintenance expenses have been far below normal expenses during a long term of years.

The steam railway engineer, who uses the train-mile as the unit in which to express operating costs, will find it necessary to adopt the car-mile as the unit for electric railway operation. Upon doing so, he may be curious to know what are the corresponding costs per car-mile on steam railways. The data given by the Interstate Commerce Commission do not permit of perfectly exact deduction of car-mile costs on steam railways, but a very close approximation is possible. Such an approximate estimate is made in the second edition of Gillette's "Handbook of Cost Data," where it is shown that the total operating expenses of American steam railways average 8.33 cts. per car mile. This is about half the average cost of operating electric street railways, and a study of the respective details is very instructive.

The civil engineer to whom electrical terms are somewhat foreign may not take kindly to the kilowatt (kw.) in place of the old horsepower (hp.), but since a kilowatt is only slightly more than a third greater than a horsepower, the relation is easily established at a glance. There are 8,760 hours in a year, hence each kw. of capacity possessed by an electric generator could deliver 8,760 kw. hrs. if the generator worked constantly for a year. The "load factor" is formed by dividing the actual number of kw. hrs. delivered from each kw. during the year by 8,760. A 30 to 50 per cent load factor may be said to be the ordinary range for most plants used to operate street railways.

Other electric terms—and they are few in number—are readily understandable by any engineer, so that a study of the costs of operating electric railways is a simple matter, provided the details are fully and clearly set forth. However, there are frequently missing links of information, which make it necessary at present to analyze the reports of several electric railway lines before one obtains a relatively complete knowledge of details.

We have undertaken to do for our readers what few of them are likely to undertake for themselves, namely, the critical analysis of the costs of operation of a considerable number of street railway reports. We shall also give the detailed cost of reproducing a large but typical street railway system, including its equipment and plant, also similar data for an interurban line. In this connection we may call attention to the fact that the word equipment is commonly used at present to include not only rolling stock but power plant. This is confusing to the steam railway engineer who is accustomed to confine the term equipment to rolling stock. It may well be asked whether it would not be better to adhere to this old practice, and reserve the word plant for all stationary equipment, like boilers, engines, generators, etc.

In analyzing maintenance costs of electric railways it is advisable to express many of the items in percentages of the first cost. This is particularly desirable as regards rolling stock and power plant. The car mile is not a satisfactory unit for either of these items. Maintenance of way costs should be expressed in dollars per mile of trackway. We use the term trackway to include all first, second, third, etc., track, excluding yard track, sidings, etc. Unfortunately no published reports give the cost of rail renewals on electric street railways. Rail wear is, therefore, a moot question. It is probably somewhat less per car mile than on steam railways; how much less, we are unable as yet to say.

We must caution our readers against drawing sweeping conclusions from the maintenance costs of one system for a single year. Wide fluctuations are apt to occur, as an article in our next issue will show.

However, the maintenance costs of a large number of street railway systems—those of Massachusetts, for example—are apt to vary little from year to year, unless a commercial panic results in a general curtailment of maintenance expenses.

With the certainty before us that public service corporations will be largely regulated in their operations by public service commissions, it behooves all railway engineers to master the details of operating costs. There is a grave danger that such commissions will underestimate maintenance costs and do irreparable injury. Engineers themselves have been the leaders in the past in underestimating maintenance expenses. No less a man than Wellington made the preposterous mistake of estimating the life of a steel rail at 300,000 to 500,000 trains. This would give an average life of about 100 years on the average American railway, or about five times the present average life. In the "South Dakota Rate Case," some years ago, Wellington's conclusions were quoted to prove a lower rail maintenance cost than was claimed by the Chicago, Milwaukee & St. Paul Ry. engineers and statisticians.

It is the custom on many of our American street railways to run open cars during the summer, while the closed cars are laid up, and thus nearly half the total equipment idle at any given period of the year. This custom is dying out, but, so long as it exists, engineers must interpret street car maintenance statistics with care. Obviously where half the rolling stock is idle, the maintenance cost per car will be almost half what it would be if all cars were in constant service.

It should also be noted that the size, weight and cost of street cars are increasing rapidly. Hence the present cost of our maintenance expressed in cents per car mile is likely to prove misleading in the future. By all odds the best way of expressing car maintenance is in percentage of the first cost of the car. Unfortunately most reports do not give the first cost of the equipment, nor even such a description of the equipment as to enable any one to estimate the first cost. The average first cost of street cars in the cities of Massachusetts was $4,000 per car in 1908, which is probably a fair average for the older cities where equal numbers of ancient $2,000 cars (7-ton) and modern $6,000 cars (20 ton) are in operation. The first cost of street cars, including their electrical equipment, is about $300 per ton. It would be well, therefore, if public service commissions were to require reports of the different classes of street cars and their weights.

How Can Recognition Be Secured for The Civilian Assistant Engineers of The Army?

There is under consideration by the Committee on Interstate Commerce of the United States House of Representatives a bill which contemplates the creation of a corps of civil engineers to have charge of all non-military engineering works of the Federal Government and to be a bureau of the Department of

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

Commerce and Labor. What the decision on this bill in the committee will be cannot be predicted with certainty. Similar bills have in years past met with a very unkind fate, and justly so in the opinion of many engineers. There are, however, circumstances now existing which may reasonably be regarded as giving such a bill as has been indicated a greater claim for consideration than its predecessors. Like the bills that have gone before it, the present bill has its genesis in a condition which calls for improvement. It voices a need for justice in the treatment of an important body of engineers. But in addition, the present bill just now seems to offer a means of obtaining succor which has been denied by other legislation on which dependence had been placed. The circumstances are these.

The authorized strength of the Corps of Engineers U. S. A. is 188. Of this number only 48 engineers of all grades are available for non-military engineering work. These officers are supplemented by the employment of civilian engineers. These civilian engineers under present conditions cannot rise higher than the grade of assistant engineer. No matter what their age and experience may be or what responsibilities may be on their shoulders, they must be subordinates in rank, in pay and in public credit to the army engineers who alone have the right of responsible command of work. It is obvious that with so few army engineers to draw upon as heads of work, there must be in many cases young and inexperienced officers in charge of work calling for age and experience, and directing men as assistants who are really their superiors in engineering ability. The condition is not equitable nor is it a defensible one from an engineering or business standpoint. Naturally there has been protest against it by the civilian engineers.

Early during the present session of Congress a bill was introduced which promised recognition to the civilian engineer of the army. For the present purpose only three provisions of this bill need be mentioned. First it provided that vacancies should be filled so far as possible by graduates from West Point, but vacancies not filled in this way might be filled by the appointment of civilian engineers. Second, the bill provided that civilian assistant engineers already in the service might be detailed for duty in charge of river and harbor work. Third, there was the provision that no engineer should be detailed in charge of river and harbor districts until he had had at least eight years of experience in that class of work and had attained the age of 35 years. As originally drawn this bill was a decided step in advance in the recognition of the civilian engineer. It was, we believe, regarded favorably by the civilian engineers in general. Further than this, however, it gave some guarantee that none but engineers of considerable experience should direct large and responsible tasks of river and harbor work.

The bill as we have briefly outlined it originated in the River and Harbor Committee of the House of Representatives. It was ordered to the Committee on Military Affairs and was reported back to the House by this Committee late in March. The Committee had amended the bill, however, so that none of the meritorious provisions of the original bill remained. In a word the bill had been shorn of all usefulness for the purpose intended or for any other purpose unless it were to reassert the solid intrenchment of the army monopoly of river and harbor engineering work.

It is not a surprising outcome of the circumstances just described that there has been a resort on the part of many civilian engineers in the river and harbor service to the old idea of removing non-military engineering work of the Government from the army engineers and placing it in the hands of an engineering bureau independent of the army engineers and even of the War Department. The bill providing for this action to which we referred in an opening sentence has the support and confidence of a considerable number of civilian engineers as representing the only means of remedy of the conditions that confront them. This bill provides for a corps of civil engineers to have charge of all non-military engineering works of the Federal Government and to be a part or bureau of the Department of Commerce and Labor. It provides for the appointment of a chief of civil engineers, with the lower grades of assistant chief, department engineer, division engineer, resident engineer, etc. It provides also for the detailing for service in the corps of Civil Engineers of such engineer officers of the army as request it. This service is to continue for four years without prejudice to their rank or rate of advancement should they elect to return to the Corps of Military Engineers at the end of that time. Should they prefer to remain in the Civil Corps, they acquire corresponding rank there and their military connection ceases. Under this bill, it is argued, the experienced civilian assistant engineers of the corps would receive rank and authority such as their ability and service deserve, nor would the work of river and harbor improvement necessarily lose the services of a single one of the military engineers who have distinguished themselves in it.

At first glance it seems that there should be no hesitation in declaring the bill just outlined as by all odds better than the amended bill from the Committee on Military Affairs. Really it is an open question, not because the military bill is at all worthy but because it is doubtful if the removal of river and harbor work from the hands of the army engineer corps would be wise public policy. It cannot be denied that a body of engineers entirely free, as the army engineers are, from political interference, holding office for life and having a high standard of personal and professional integrity is a very strong and desirable guarantee of efficient and honest administration of public work. Neither can it be denied that the one bureau of civilian engineers that has been organized, the engineers of the Reclamation Service, has had its efficiency reduced and is almost in danger of disruption by such political influences. We do not believe that the Reclamation Service engineers are not as honest or that the civilian engineers of the proposed new corps would not be as honest and honorable as individuals in every way as are the engineers of the army, but they would not be free from danger of political interference nor would they command the public confidence in their integrity that the army engineers undeniably do command. For these reasons we are candid to acknowledge, we do not see a way clear to commend any general proposition to take the river and harbor work of the country out of the control of the army engineers.

There is just cause for all the complaints of the civilian assistant engineers of the army corps of inadequate recognition in rank and pay. We shall go even further and assert that we do not believe that it is the disposition at present of any large proportion of the army engineers to allow these civilian assistants to gain the opportunity for equal rank or pay or equal credit for their services. They will, we believe, exert their influence against any legislation like that proposed in the original bill of the River and Harbor Committee which will open the door through which civilian engineers may take equality with them. This is a feeling that can be overcome and which, we believe, is being overcome, at least to the extent that some action should be taken to secure for civilian assistant engineers something of the recognition to which their ability and responsibility entitles them. Is it not the wisest action of civil engineers as individuals and as organized bodies to work for improvement in this direction rather than toward securing an independent civil engineer corps such as is proposed in the bill which we have outlined?

Experimental Grouted Macadam Road.

During the past year a New York State Commission of Highways set aside $1,800 for an experimental piece of concrete road to be constructed according to ideas of the County Engineer of Westchester county. The piece of work was constructed on Road No. 52 last July under the direction of Eberhard J. Wulff, County Engineer, and the following matter has been taken from his report to the State Commission of Highways.

Crushed trap rock of a size usually employed in the top course of a macadam containing, by experiment, about 40 per cent voids was spread on the old macadam surface and rolled by a steam roller to a finished thickness of about 3 ins., the percentage of void being reduced by this rolling to about 25.

Screened sand and Atlas Portland cement were mixed in the proportions of one part cement to three parts sand, in the dry state on a mixing platform, spread upon the road surface and worked into the voids by sweeping about with brooms and continuous rolling with a steam roller until the voids were completely filled with the dry sand and cement mixture. Water was then spread freely on the road surface forming a fluid grout of the sand cement and water, the sweeping, watering and rolling being continued to assist a perfect penetration and filling of the voids between the adjoining particles of stone. More sand and cement mixture was spread wherever it was found necessary to completely fill all voids and to leave a very thin covering over the entire surface, which when completed was smooth and even but slightly gritty. The roadway was then permitted to harden for about seven days before being thrown open to traffic, the roadway being wet down frequently during that period. Expansion joints were placed about 25 ft. apart by pouring a thin line of heated asphalt across the roadway after the broken stone was compacted but before any sand and cement mixture was spread. A section of 100 ft. in length was placed without expansion joints but reinforcing the concrete slab with woven wire mesh.

The completed roadway states the report presents a smooth surface, equal to new macadam, is quite free from irregularities frequently formed in concrete roads and offers a good foothold to horses. Automobiles have no detrimental effect on the road. After five months of fairly heavy traffic over the road no serious defects have developed and the coming winter will prove the efficiency or the advantage of expansion joints or reinforcement.

The measured quantities of materials used were 88 bbls. of cement, about 40 cu. yds. of sand and 200 cu. yds. of 1½ in. trap rock (commercial size), the resulting concrete representing a mass of 150 cu. yds. in place. Expressed in the proportion of the completed concrete the mixture would be about 1-3-7½; if expressed in the proportions of the loose materials used in the mixture would be about 1-3-12½. It would be manifestly impossible to secure a dense mixture if the materials were mixed in the latter proportions in the loose state, and the resulting concrete would unquestionably be porous and full of cavities and lacking in resisting power for road purposes. The result of the dense concrete being obtained by the expediency of reducing the voids contained in the loose stone by rolling.

The cost of the improvement was very nearly $1 per square yard and was in excess of the preliminary estimate. This was largely due to the cost of labor and the cost of renting tools and machines, and should prove materially less if similar work is done on a larger scale. All sprinkling was done by hand sprinklers, as it was found impossible to use a sprinkling wagon. All sand and cement was mixed by hand when a mechanical mixture would have been more economical.

The detailed cost of the work was as follows:

	Total.	Per sq. yd.
200 cu. yds. trap rock at $2.47.	$ 493.29	$0.2774
88 bbls. Portland cement	148.20	0.0805
50 cu. yds. of sand	75.00	0.0422
1,600 sq. ft. wire reinforcement	52.10	0.0292
2 bbls. of asphalt	15.00	0.0080
Lumber	16.00	0.0090
Steam roller, 21 days	210.00	0.1182
Teaming	150.00	0.0856
Hire of tools and machinery	100.00	0.056
Labor	517.50	0.291
Total	$1,772.00	$0.996

Concrete and Reinforced Concrete Section

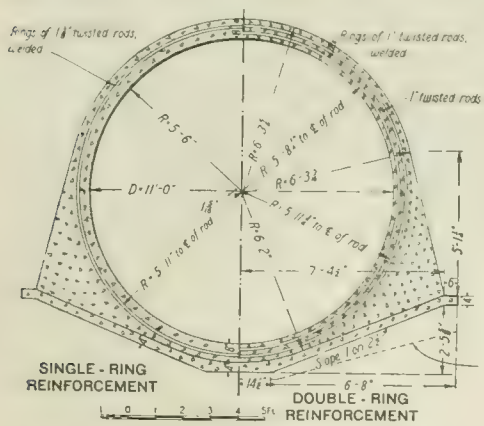
Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Results of Tests for Leakage Under Pressure of a Reinforced Concrete Pipe.

The reinforced concrete pipe shown in section by the accompanying cut was constructed for test purposes at Hunter's Brook on the Catskill Aqueduct of the New York water supply. The section 210 ft. long was built in place with the purpose of making it a part of the permanent construction should the tests prove satisfactory.

The principal features of this pipe are: Length 210 ft., made up of seven 30-ft. sections; inside diameter, 11 ft.; thickness, 8 ins.; reinforcement, welded rings of twisted square steel bars, about 1 sq. in. of cross-section for every 2½ ins. of pipe length. The concrete, consisting of 1 part Portland cement, 2 parts sand or stone screenings, and 3½ parts gravel or broken stone, was machine mixed, quite wet. Transverse tests made on samples of this material at 7 months —the average age of the pipe when tested— indicated an average tensile strength not less than 330 lbs. per sq. in., the so-called average transverse strength being 400 lbs. per sq. in.

When first tested under a head of 28 ft. the leakage from the pipe was at the rate of 560,000 gals. per mile per day, most of which was due to porous spots in the sides of the



Section of Reinforced Concrete Conduit Tested for Leakage.

pipe, especially where stone screenings had been used in the concrete instead of natural sand. After grouting and pointing the defective portions with cement mortar, the leakage was as follows:

Head feet.		Gals. per mile per day.
30	Leakage	55,000
62	Initial leakage	119,000
	Decreasing after 6 hours to	78,000
93	Initial leakage	215,000
	Decreasing after 2 days to	110,000
125	Initial leakage	465,000
	Increasing after 5 repetitions in 6 days to	816,000

After again pointing and painting the interior surface with cement grout, the leakage was as follows:

Head feet.		Gals. per mile per day.
34	Leakage	28,000
62	Leakage	36,000
92	Leakage	114,000
125	Initial leakage	240,000
	Increasing after 6 repetitions within 6 days to	497,000

The magnitude of the leakage in the first test was due mainly to imperfections in the concrete. Under a moderate head, less than 100 ft., the leakage decreased while the head remained constant, but when the head was increased the leakage increased at a somewhat higher ratio. On reaching a certain "critical head," in this case about 100 ft., the permeability of the pipe was radically changed, the leakage not only increasing at a much higher ratio than the head, but with each new application of pressure, indicating that the concrete begins to crack when the "critical head" is exceeded. A large number of longitudinal cracks were actually observed; most of them, however, were so fine as to be perceptible only by color differences while the concrete was still damp after the pipe was emptied. When the first cracks appeared the tensile stress in the concrete was estimated at 270 lbs. per sq. in., or 82 per cent of that derived from beam tests. The above results are for the pipe as a whole, although considerable portions of the pipe remained dust-dry under the maximum head of 125 ft.

Method of Constructing Reinforced Concrete Trestles for Railways, with Some Costs.*

In railroad construction in the West and South it was, and is still quite generally the practice to bridge unimportant streams, ravines carrying little or no drainage, bayous, and marshes, with pile or timber trestles. As the cost of timber increases and as the standards of railroad maintenance are raised, it is the practice on most roads to replace these structures, when they become ripe for replacement, with structures of a more permanent character. Where the drainage areas are small, pipes or masonry culverts are often built and the remaining portions of the bridges replaced by an embankment, and at such a low cost as to be economical. But there are, on most roads traversing the Mississippi valley, a great many pile trestles in river bottoms, and over bayous or swamps, which may not be filled and which, if replaced with steel bridges on permanent supports, would be extremely expensive, because of their great length.

These conditions are very familiar to all maintenance engineers on roads traversing this part of the country, and the necessity for retaining the entire existing opening is, in many cases, perfectly obvious. In most of these cases there is no need for spans of any great length, there being neither ice nor drift to catch upon supports placed closely together. For bridges having the characteristics described, many of them of lengths from 100 to 1,000 ft. or more, the writer has devised a construction which seems well fitted to replace the timber or wooden pile trestle bridge. As the wooden pile bridge is the cheapest wooden construction possible, it occurred to the writer when considering how best such structures might be made permanent to design a reinforced concrete construction, following the main features of the timber trestle.

An investigation of the reasons for the great economy of such a construction as the pile trestle shows that it is largely due to the small amount of work necessary to be done in the field. There are no cofferdams, foundation pits, or falseworks to be built. Very little raw material has to be unloaded and cared for. The members comprising both the substructure and superstructure are taken out and put in place, often largely by machinery and with a minimum of disturbance of the track and delay to traffic. It was evident that if a construction of permanent materials, having the characteristics mentioned, could be devised, the result would be what was wanted.

A structure embodying these features was built and tested, and with the experience gained, a standard plan was drawn up, which is shown by Fig. 1.

It should be emphasized that this construction is suited only for shallow openings, and it is the writer's practice to limit the height of concrete pile trestles to 16 ft. from ground line to base of rail. For greater heights it is his practice to substitute thin piers for the pile bents, although at considerably increased cost. Figure 2 is a view of a trestle built in accordance with the standard plan of Fig. 1.

The construction of these bridges in any great length requires some little organization, and the more thorough this is the less will be the unit cost and the better the construction.

In the bridges so far built, concrete piles of two kinds have been used—one being molded in horizontal forms and the other made by rolling in a machine, under the Chenoweth patents. The molded piles were used in the first of these bridges. They were sixteen inches square at the butt, had a 4-in. chamber at each corner, a taper of 4 ins. in 30 ft. on each face, and were pointed at the tip. The reinforcement consisted of four ¾-in. sq. corrugated bars, hooped with No. 12 gage steel wire, wound at close pitch near the butt and point, and at 3-in. pitch over the greater part of the length of the pile. The reinforcement was assembled on a mandrel and the spiral hooping wound around it by turning the mandrel. After the hooping was in place it was tied at frequent intervals with No 16 soft wire, and the complete reinforcement was then withdrawn from the mandrel.

The forms were of wood, unlined and made so that the sides could be removed as soon as the concrete was firm; the pile was left on the bottom boards until hard enough to stand handling. The reinforcement was hung in the forms by wires depending from the cross braces and concrete, composed of 1 part of cement to 4½ parts of gravel, mixed to a slushy consistency, poured in. The gravel was generally screened so that all the sand and pebbles ½ in. in diameter or less were retained and used, the coarser aggregate being rejected. The piles were allowed to harden at least 30 days before being shipped. This seems to be about the least time which can be allowed, as attempts to ship and drive piles of less age have not been successful. More extended seasoning is often easily obtained and is to be preferred.

The rolled piles are made in the machine shown by Fig. 3. This machine consists essentially of a movable platform, a shaft or mandrel, and means for moving and turning the piles, together with rolls for holding them in line during fabrication. The illustration shows some completed piles in the seasoning yard, where the piles are sprinkled frequently to assist the hardening of the concrete.

A somewhat incomplete comparison of the first year's costs of rolled and molded piling indicates that there is little difference in the cost of the two kinds. As the cost of making reinforcement for the molded piling was one of the principal items, it was decided to experiment with molded piling made without taper, the idea being to use a wire fabric, as reinforcement, which could be simply folded into a square and wired together at the lap, thus avoiding considerable labor. The cost of forms is also much reduced if they are not tapered. An efficient plant was designed and is shown in Fig. 4. On each side of each form a rail is placed. A pair of trucks has a short piece of track spiked to it at right angles to the track on which it runs, the level of the latter being such that a car can run off the upper track directly on to the rails between the forms. The car on the trucks is a hopper-bottom dump car and carries a half yard of concrete, Fig. 5. In operation the

*A paper read before the Western Society of Engineers, April 13, 1910, by C. H. Cartlidge, Chicago, Burlington & Quincy R. R.

mixer is placed high enough to dump into this hopper car standing on the trucks. This two-storied car is pushed over to the form and the dump car run off and dumped directly into the form. In spite of the economy of this arrangement no great difference in the cost has resulted, partly because of the difficulty of handling the square piles. On the whole, in the absence of definite comparative tests, the writer is inclined to favor the rolled pile. Tests to determine the relative strength of the two kinds will be made, however, for both compression and bending. It is probable that each form of pile will be found to have its own place and use.

As yet, no soil has been encountered in which wooden piles could be driven and in which it has not been possible to drive the concrete piles. In some soils it is expedient to employ a jet; in others, an ordinary drop hammer, a steam hammer, or a combination of the jet with one or the other forms of hammer. It is necessary to lift the drop hammer somewhat more slowly for the concrete pile than for the wooden pile, in order not to set the driver into vibration. A cushion of some elastic material must be placed between the hammer and the pile, and with this precaution very little damage to the head of the pile results, even after long continued driving. As a matter of fact, it is surprising how much punishment a well seasoned pile will stand. When it is necessary to drive the pile below the leads, as is generally the case, the follower is placed on top of the cushion. As the loads on these piles are great it is necessary to drive them to refusal, so that accurate knowledge of the required length is necessary. In case it is found that the piles so driven do not reach the elevation called for on the plans, the depth of the cap is increased accordingly. If it is found impossible or impractical to drive the piles to the depth anticipated, they can be cut off without difficulty. The cut need not be a smooth one, as the casting of the cap will take care of all irregularities of the head of the pile. Should settlement occur in a finished bent, the strength of the cap is important, so that the loads may be equalized and even settlement result. Experience has shown that the design of Fig. 1 provides sufficient strength. Slight settlement has taken place in two bridges but without causing cracks or damage. As the settlement was doubtless due to the fact that the piles had not been driven to refusal, a mass of concrete was placed about each settled bent, extending from just below the ground line to about three feet below; the slabs were jacked up to grade and a layer of concrete was placed between them and the caps.

The manufacture of the floor slabs is best accomplished in a convenient yard, where advantage can be taken of economical methods. Such a plant is shown by Fig. 6. It is necessary to provide a firm, unyielding bed. The sides and ends of the forms are removable, and as one span consists of two slabs, a temporary partition is placed in each form to be removed after a half span has been completed. A layer of paper is placed against the slab and the remaining half is cast. Drainage holes are also cast along the dividing line.

By referring again to Fig. 1 it will be seen that U-bolts or stirrups are set in the upper part of the slab to permit of its being easily handled. These are set at an angle so that there may be a direct pull when attached to a chain, thus obviating the necessity for a toggle-beam when lifting and placing the slabs.

After the slabs have remained in the forms for from two to four weeks, they are lifted by means of a locomotive crane and piled to one side until hard enough for service, the minimum time for seasoning being three months. When seasoned they are readily erected by the same locomotive crane, a mortar joint being placed between the bottom of the slab and the cap.

After being erected the slabs are painted on top with a waterproofing compound, and the joints over the caps are filled with a mastic of tar or asphalt and sand. It is better to fill these joints with such material than to allow them to fill with sand, as the former will admit of the slight expansion necessary. Thus far, the best material for waterproofing, with which experiments have been made on work under the direction of the writer, has been found to be a paint made of coal tar, Portland cement and kerosene, after a formula published in an engineering periodical a few years ago. This compound not only covers the surface but sinks into the bonds with it, so that two or three coats are sometimes re-

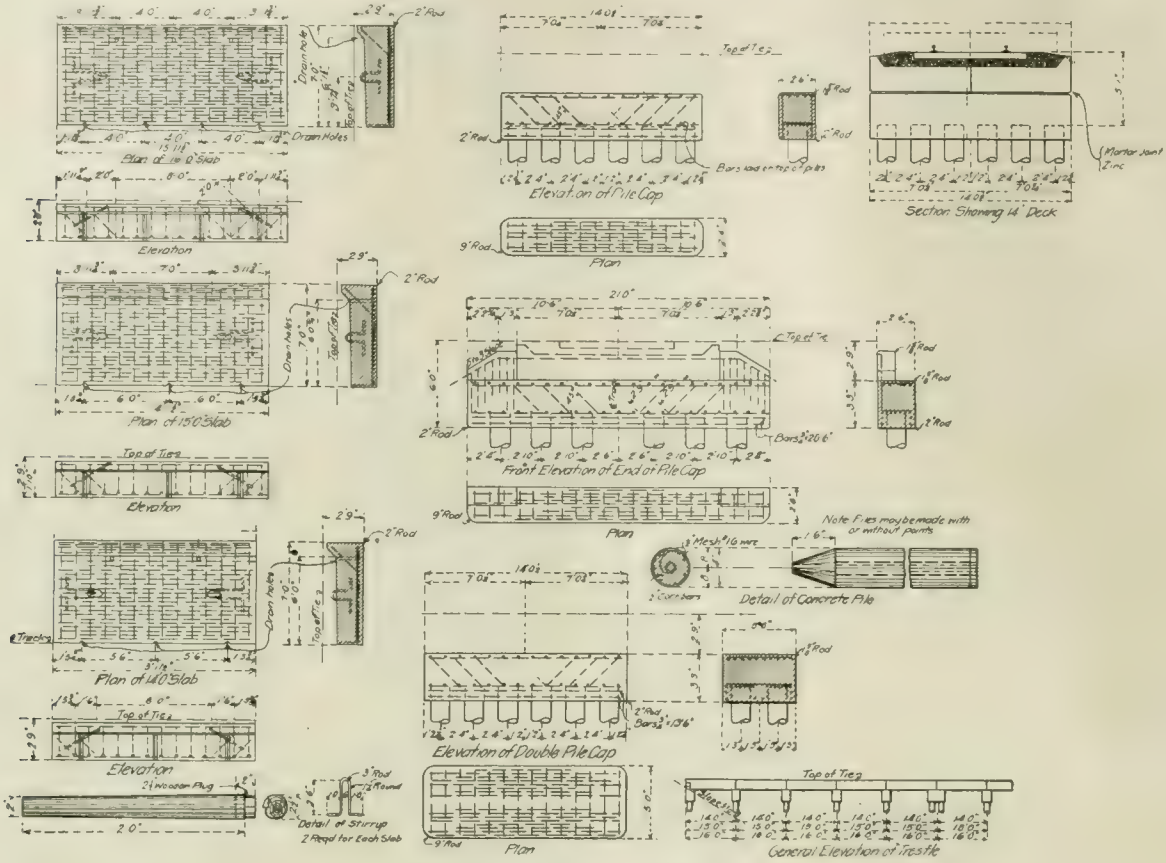


Fig. 1—Details of Reinforced Concrete Pile Trestle.

Fig. 2—View of Reinforced Concrete Pile Trestle.

Fig. 3—General Arrangement of Plant for Rolling Reinforced Concrete Piles.

quired. It is put on with paint brushes, in the same way as ordinary paint is applied. Another valuable attribute is its ability to adhere to moist or even wet concrete. Still another and not its least recommendation, is its very low cost.

It is evident that in a pile trestle the piling must be capable of transmitting the lateral and longitudinal stresses to the ground, so that considerable bending strength is required.

The double bents are designed to take up such longitudinal stresses as might be apt to place undue bending on the piling. As a matter of fact the stiffness and weight of the floor are such that it is somewhat questionable whether the double bents are necessary. It seems well to put them in, however, as an extra precaution.

As to cost, it is difficult to generalize, as conditions of traffic, length of structure, etc., have a very important bearing. With men experienced in this work, several bridges of lengths of from 80 to 250 ft. have been built at a total cost of from $20 to $26 per lin. ft. and on lines carrying heavy traffic, while in one or two short bridges of two or three spans, the cost has been as high as $45 per lin. ft. For the purpose of estimating, a cost of $30 per lin. ft. plus a constant of $300 will be ample for the design shown.

For bridges having a height above the ground line greater than 16 ft., a plan involving the use of thin piers is preferable. Such a structure is shown by Fig. 7. The piers are heavily reinforced and are generally founded upon wooden piles cut off 5 or 6 ft. below the ground line. Because of the greater cost of these piers, it is generally economical to make the spans longer than 16 ft., spans of 18 to 25 ft. being common. A great number of such bridges have been built and have so far developed no defects. When the spans are as long as 25 ft., however, it is impracticable to build the slabs in a plant away from the bridge, because of their great weight. In general, it has been found best to build them on false work adjoining their final position and to jack them into position.

The writer wishes to lay especial stress upon the necessity for the use of the best materials and the most skillful labor on such work. Not only should the cement be tested but also the sand to be used, unless its properties have already been thoroughly established. If the work of making piling or slabs is to be done by contract it should be done by experienced men, under proper specifications and under rigid inspection during every step of the process. If the work is done by company forces, the foreman must be one worthy of confidence, willing to obey instructions to the letter, and intelligent enough to realize the necessity for refinement of the work. The comparative novelty of reinforced concrete, and especially of such designs, makes necessary a most efficient organization for the work, and the placing of all possible safeguards to insure its integrity. Such organization and safeguards have been in effect in the case of steel construction for so long that they have become matters of course, and when reinforced concrete is carried on with similar care and scrupulous watchfulness, no fear need be felt as to its value as a material of construction. Without these, it is needless to say it is dangerous.

It is possible, under some specifications, to design short span steel bridges on concrete supports which will be as cheap as the designs described herein, but not, the writer believes, of equal strength to the bridges shown in these designs. Further, if the obvious advantages of ballasted, non-corrodible, fire-

proof bridges are considered, it will be seen that there is a preponderance of good qualities on the side of the reinforced concrete construction.

Methods and Cost of Constructing a Concrete Lock on the Illinois and Mississippi Canal.

The following data relate to the construction of what was known as the Feeder Guard Lock on the Illinois & Mississippi Canal. There were two guard locks on the canal, the one described here and one located at the head of the lower rapids of Rock River, near Moline, Ill., the costs of which are given in "Concrete Construction: Methods and Costs," by Gillette and Hill.

The Feeder Guard Lock was a combination structure. Its masonry work comprised, therefore, the foundations and walls of the lock proper; sills, pier and abutment for two sluice gates; foundations for a highway bridge and foundations for two small needle dams. All this masonry was concrete.

Foundations.—The lock was in rock cut which was excavated by drilling and blasting and loading into dump cars by steam shovel, bringing the bottom to grade with pick and shovel. Under the lock walls all rock that could be loosened by pick was taken out and the surface was brought to grade with natural cement concrete. Trenches were also excavated under the meter sills and at other points and filled to grade with Portland cement concrete.

Lock.—The lock is shown in plan by Fig. 1, and is 35x170 ft. inside chamber and 228 ft. long, with a retaining wall at each end, making a total length of 340 ft. The sections of the walls are indicated by Fig. 2. For convenience the stepped wall next the rock bank will be called the east wall and the other will be called the west wall.

Other Masonry.—The sluice gate abutment was 51½ ft. long, stepped down at both ends, and 18 ft. high and 4 ft. wide on top. The sluiceway pier is 31½x6 ft. and 21 ft. high. The sluice-way sills were 15½ ft. wide and 3 ft. thick.

METHODS OF CONSTRUCTION

The masonry work comprised 79.9 cu. yds. natural cement concrete and 2,404.7 cu. yds. of Portland cement concrete. Figure 1 shows the layout and general arrangement of the concrete construction plant.

Materials.—Gravel was taken from the river about one-half mile from the lock and required neither washing or sluicing. Sand for facing mortar was obtained by screening the gravel. The gravel was hauled and stored in a pile, as shown by Fig. 1. The cost of the 550.7 cu. yds. of gravel was as follows:

Item	Total.	Per cu. yd.
Loading, screening and hauling	$2,934.18	.....
Coal	31.33	.....
Miscellaneous	30.38	.....
Total	$2,995.89	$0.544

Rock for broken stone was taken from the lock excavation and adjacent canal prism, loaded into dump cars and hauled by a small construction engine to a No. 2 Gates crusher plant located as shown by Fig. 1. The stone was screened to sizes passing a 2-in. mesh and stopping on a No. 5 screen into a double bin holding about 40 cu. yds. The stone bin was elevated and wagons or cars passing underneath were loaded by chute and hauled to the storage pile, where a reserve of several hundred yards was kept; ordinarily the stone was crushed as needed for concrete. The cost of 1,875 cu. yds. of crushed stone was as follows:

Item	Total
Erecting crusher	$ 216.43
Laying track	34.00
Loading rock	617.59
Crushing	689.22
Coal	65.95
Engineering	7.00
Miscellaneous	30.38
Total	$1,641.81
Total per cubic yard	$0.876

Utica natural cement and Alpha Portland cement were used. About half of the cement was received and stored in a warehouse one mile from the lock and was trans-shipped to the lock; the other half was hauled direct to the lock and transferred to narrow-gage flat-cars which took it to the cement store house. These same narrow-gage cars brought cement from the warehouse to the cement stone house. The cement store house was 18x36 ft., and had a capacity of 150 barrels.

The shed was about 18 ft. wide and 36 ft. long, the long side being parallel to the center of the lock and had a capacity of about 150 bbls. of cement. The floor was built on a level with the top of the flat cars on which the cement was hauled, that part over the track being omitted so that a car could be pushed into the shed and its top form a part of the floor, leaving the car to be unloaded when desired. This was found to be very convenient as a supply of cement could be placed on the permanent floor and the car reloaded whenever time permitted. This was usually done after the section of the form for the day's work had been filled with concrete, and the top dressing was being put on the same. Two cars would be filled and brought to the shed, one car being unloaded on the platform, and the second car remaining unloaded in the shed. The second car was usually unloaded as the cement was used the following day by the regular cement handlers.

At the opposite end from the track entrance, the platform was built entirely across the shed and a bin was built on it for opening and mixing the cement, several barrels being opened at one time.

The cement was measured in a rocker and dumped into the material car. The rocker consisted of a box made of 1-in. lumber mounted on a pair of rockers cut from 2x12 in. lumber, and fastened together by pieces of wood 2x4 ins. One of these pieces served for a handle to raise and lower the rocker. The box was the shape of a scoop, having one closed end and the other a projecting end with a slide in it. A strip of wood was nailed around the inside of the box at a proper height to measure the required amount of cement for one batch of concrete.

Mixing Plant.—The general layout for the concrete work is shown by Fig. 1. For convenience we will designate the tracks from the crusher and material piles to the material hoppers as the "supply tracks," the track from the material hoppers to the mixer, as the "material track;" and the tracks from the mixer to the hoist and the hoist to and on the forms, as the upper and lower "concrete tracks," respectively. All of the concrete, except that portion in the foundations, was mixed with a No. 2 Smith concrete mixer.

The materials were dumped into the mixer through a specially constructed extension chute, which was permanently attached to the mixer, raising and lowering with the drum as the concrete was dumped and the machine again righted.

The mixer, engine and a vertical boiler were furnished on a single frame mounted on trucks, and cost the United States $887, housed and delivered at Rock Falls, Ill. The extension chute was made in a local shop and cost about $30.

The mixer was placed in the bottom of the lock pit, about 60 ft. above and on line with the east wall of the lock. The wheels were removed from the truck and the mixer set up on a crib high enough to allow the concrete to be dumped into a car.

Tracks.—The lower concrete track was parallel to the center line of the lock. Over the mixer, at a height sufficient to clear the machine, and at right angles to the lower concrete track was the material track carried on a trestle to the towpath. On this track the dry materials for the concrete were hauled to the mixer from the material hoppers in a car similar to those used for carrying the concrete. The car will be described in a succeeding paragraph. The materials were emptied into the mixer by opening a slide in the bottom of the car and allowing it to pass into the mixer below, through the extension chute. The ties above the mixer on the material track were omitted on account of the chute.

Water Supply.—The water used in mixing concrete was supplied through a small pipe line from the water tank belonging to the narrow gage railroad. A barrel was placed on the trestle above the mixer from which the water was dipped in a pail and poured into the mixer through the extension chute.

Material Hoppers.—The material hoppers consisted of a pair of hoppers, one for gravel and one for crushed rock, located on the material track at one end of the cement shed, about 50 ft. from the mixer.

The hoppers were about 8 ft. square on top, 2 ft. square on the bottom, 4 ft. deep, and were about 12 ft. between centers, thus allowing an opening between them for putting the cement in the material car. Each bottom was fitted with a cast iron chute with a steel slide having a lever arranged for opening and closing the same. The chutes were identical with those used on the bottom of the concrete cars. The bottoms of the hoppers were high enough to allow the material cars to pass under them to be filled and the top was low enough to allow the material from the crusher and the piles to be dumped into them from dump cars running on the supply tracks which were laid on the natural surface.

The cement shed was set on the towpath with its long side parallel to the canal. The hopper next to the canal prism was used for gravel, the track to it being parallel to the short end of the cement shed and was carried over the tow path on a short trestle. The other hopper was used for the crushed rock and the track to it was carried on the natural surface parallel to the long side of the cement shed terminating at the side of the other track.

Concrete Cars.—On all previous work on locks, the side dump cars were used for carrying the concrete from the mixer to the forms and it was necessary to build a special runway at the side of the forms for the track. On the abutments for bridges, on the Feeder and Western Section, it was found that this car was objectionable and a car was designed with a bottom dump. Castings were made in a local foundry and the car was built by the carpenters on the work.

It consisted essentially of a wooden hopper lined with sheet steel and mounted on two pairs of trucks, 36-in. gage, having a casting in the bottom with a slide made of ¼-in. steel plate. The opening in the casting was 12 ins. by 18 ins. The cross section 2 ft. above the casting, and from there to the top of the car, was 3 ft. x 3 ft. 6 ins. The total height was 3 ft., and when level full the car held about 22 cu. ft. The slide was operated by a lever attached to the side of the car. The car proved to be far superior to the side dump car as it did not require a special runway and the concrete could be distributed along the entire length of the pit and only a part of the concrete used if desired. A set of trucks for one car cost the United States $12.90, and one chute $10 at the foundry.

The Hoisting Plant.—All of the concrete was raised from the canal bottom to the top of the forms. An elevator was constructed of 6x8-in. timbers, and a single drum Lidgerwood hoisting engine was used for hoisting. The frame of the elevator was mortised and fastened with wooden pins, the leads being made of 3x8-in. pine.

In order to provide a passageway for cars without using switches, a track just long enough to hold one concrete car was constructed, at the same elevation as, and on the opposite side of the elevator, from the track leading to the forms. Two cars were used for carrying the concrete, one car being at the mixer when the other was on the upper concrete track. The cage of the elevator would be left at the top making a continuous track over the elevator and the car from above would be run over it to the passageway. The cage would then descend, the car of concrete be placed thereon, and raised to the upper track. As soon as the loaded car was pushed off, the empty one was pulled on and lowered to the mixer, and the operation

repeated. For every load of concrete taken to the forms, it was necessary to raise the cage twice. This would seem to be a waste of both time and power. However, the facing or "fine stuff" was mixed near the foot of the elevator, and it was necessary to hoist it. Also it was loaded into wheelbarrows and hoisted on the second trip of the cage, thus making a load for nearly every ascent of the cage. The scheme worked very nicely and very little time was lost at the elevator.

Forms.—Figure 2 shows the general plan of forming at the Feeder Guard Lock. The posts were 8x10-in. timbers, the sills and braces were 6x8-in. timbers, the facing lumber was 3x12-in. pine, surfaced on four sides, and the spreaders were made from 2x4-in. and 4x4-in. materials.

Anchor bolts ¾ in. diameter and 2 ft. long were set, with Portland cement, in the rock on the center line of the lock at intervals of 4 ft. and 8x10-in. timbers were bolted thereto. Sills were laid from this timber to the bottom of each post and the braces were placed from the sill at an angle of about 45° to the post at a point near the top of the wall. The braces were cut to fit on top of the sills and against the posts, leaving shoulders of about 2 ins. to abut against blocks of 2-in. lumber, which had been securely nailed to the sill and to the post.

Wedges were placed between the shoulder and block on the sill, with which to plumb the walls and between the sill and central longitudinal timber, to bring the face of the form to the exact line of the wall.

Posts were set opposite each other on the front and back of the wall. The foot of the braces at the back of the wall were set against the rock on the side of the ditch for draining the pit.

East Wall.—Spreaders 2x4 ins. were cut the exact length of the width of the wall and on the low wall one was placed about 3 ft. below the top of the wall, and one about 1 ft. above the bottom. A ⅝-in. rod connected the two posts at about one-half of the height of the wall, the protruding ends being cut off a little under the face after the form had been removed, and the surface repaired with mortar of the same consistency as the facing. The posts on the low wall were 16 ft. long, and were tied at the top with a 3x12-in. plank, which was bolted at the top of the post and had a block under it nailed to the post. This was done so that the track for the concrete cars might be fastened thereon. On the higher wall, the posts were 20 ft. long and three 4x4-in. spreaders and two ⅝-in. rods were used. The facing lumber was put on with 40-penny wire nails.

West Wall.—The west wall having been built against the natural rock, and in a number of places having the rock extend into the wall section, the forming was different from the east wall. Where the rock projected into the section, the posts on the back were set upon the rock and braced back to the rock slope. Where the excavation had been made wide enough for the regular section, the posts were set on the bottom, concrete deposited around them, and the posts cut off when the forming was removed, leaving the ends embedded in the concrete.

The inside of the form was built the same as the east wall form except that the ⅝-in. rod was omitted and a short secondary brace used in its stead.

Sections.—The forms for each wall were divided into sections by bulkheads made of 2x12-in. lumber for facing and 6x8-in. timbers for posts, and braces. The bulkheads were so placed that alternate sections were filled with concrete, the bulkheads then removed and the intervening sections filled. A 3x12-in. plank with sides and ends beveled was nailed on the inside of the bulkhead and removed with it after the concrete had been deposited to form a bond between the adjacent sections. Each wall was divided into ten sections, of which two were 20 ft. long, two were 22 ft. long, and six were 24 ft. long. The smallest section contained 50 cu. yds. and the largest 148 cu. yds.

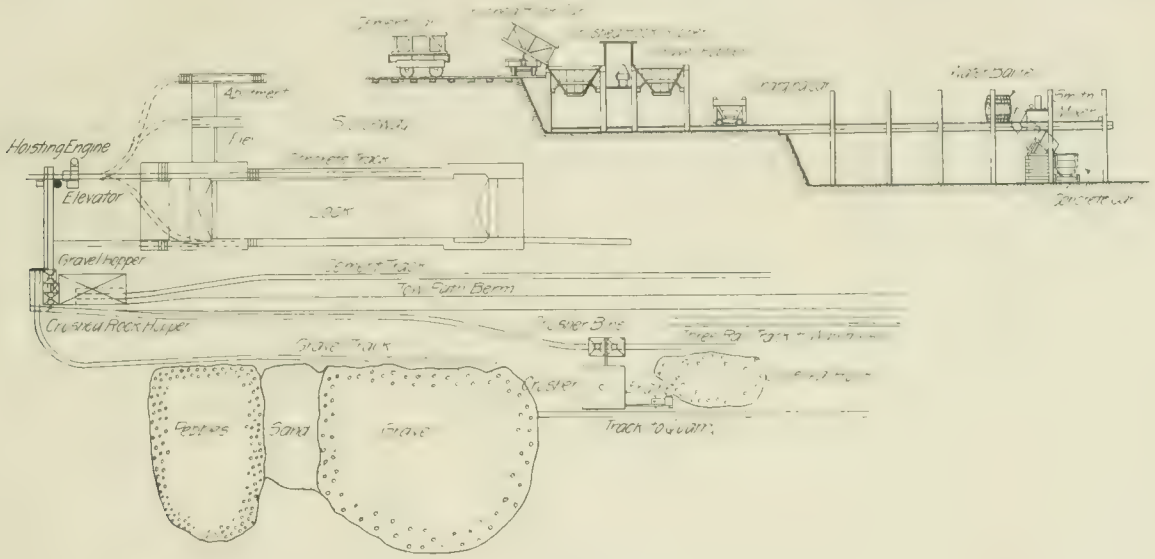

Fig. 1—Lay-Out of Concrete Construction Plant for Canal Lock Work.

Hollow Quoin Casings.—The hollow quoin casing is made up of several sections about 5 or 6 ft. in length. Each section has lugs cast upon them through which the adjoining sections are connected with short steel pins. The form for the wall at this place is built the same as at other places, especial care being taken to make the walls plumb. The quoin casting is then temporarily fastened against the form and the section filled, the temporary fastenings being removed and the anchor bolts carefully set as the concrete is filled up to them.

Lumber.—The lumber for the forms was purchased with the expectation that it would be used for forming for the Guard Lock, and subsequently used in the construction of the apron for a movable dam. If this had not been the case, smaller sized timbers could have been used. The dam has not been constructed as yet, but the lumber has been used for forming at the Guard Lock and at Aqueduct No. 9, on the Feeder. About 131,000 ft. B. M. of lumber was purchased at a cost of $2,590.69, of which a charge of $813.34 was made to the lock.

Mixing and Placing.—As soon as the form for the end of the east wall was ready, a trestle was built of 6x8-in. timbers, and a track laid from the hoist to the form, and work begun depositing concrete in the end section.

Mixing.—At the beginning of the work, the material hoppers were filled, one with gravel and the other with crushed rock, and as the work progressed the hoppers were kept supplied with 2½ yard dump cars, one car being used for each material.

The dump car was pushed under the bin of the crusher, the chute opened, the car filled with crushed rock, and drawn by a single horse from the crusher to the hopper. The track was a little up-grade from the crusher so that the car returned by gravity.

The gravel was shoveled into a car on another track by a number of men and it was hauled by the same horse to the gravel hopper, where it was dumped. One horse with a driver attended to all of the hauling. The material hoppers acted as a governor to the mixing plant.

All of the dry materials were carried to the mixer in a single material car, one batch at a time. A batch consisted of 9 cu. ft. of crushed rock, 9 cu. ft. of gravel, and 2 cu. ft. of Alpha Portland cement.

The car was first pushed under the hopper containing crushed rock, where it received the proper amount of that material. It was next pushed ahead to the opening between the hoppers where the cement was dumped into it from the rocker above. It was then pushed under the gravel hopper, where the proportion of gravel was obtained. The car was then pushed over the extension chute of the concrete mixer and the material dumped into the mixer. The cement being between the crushed rock and the gravel, a partial mixing was obtained when the materials were dumped into the mixer. It was found when the rock was put in the bottom of the car that it did not arch over like the gravel, and the car was dumped much easier than when the gravel was placed in first. Some trouble was experienced in getting the material through the extension chute on the mixer and it was found necessary to keep a man at this position all of the time. This attendant also attended to the wetting of the concrete.

A bucket of water was placed in the mixer before the materials were dumped and enough added afterwards to give the concrete the proper consistency. The concrete for this lock would be considered a rather dry mixture, there being just enough water used to flush to the surface after the concrete had been thoroughly tamped.

A batch would be placed in the mixer as soon as one was taken out, allowing it to remain mixing as long as possible without delaying the work. About 20 batches were mixed per hour. However, we crowded the capacity somewhat, using 20 cu. ft. of loose material instead of 13½ cu. ft., the rated capacity. A small amount of the concrete would be spilled out of the mixer, but was easily thrown back into the next batch by one of the attendants.

The conical shape of the mixer, and the wings attached to the inside of it, threw the materials together and turned them in such manner as to give a first-class job of mixing. The machine was eminently satisfactory. By

tilting the machine, the contents of the mixer was dumped into one of the concrete cars. The car was pushed to the hoist, elevated, and taken to the section which was being filled.

Depositing.—The bottom of the section having been washed with a wire broom and a mortar consisting of 1 part Portland cement and 2 parts of sand about ½ in. thick spread over the entire bottom surface, the concrete was dumped into the pit. Considerable of the labor of spreading was saved by opening the slide in the bottom when the car was at one end of the pit, and pushing it along, distributing the concrete the entire length of the pit. The concrete was deposited in layers about 6 ins. thick and thoroughly tamped.

Surfacing.—All of the exposed surfaces and copings of the walls were finished with a mortar consisting of 1 part of Portland cement and 2 parts of torpedo sand. The materials were first thoroughly mixed dry and then water was added as the mixture was turned over, five or six turns being given. The mixing board was placed at the foot of the hoist and the facing was carried to the top of the form in a wheelbarrow, where it was dumped into a box in the pit, through a galvanized iron tube.

The box had a capacity of about 2 cu. ft. and had handles on its ends so that it could be easily carried about in the pit.

The tube was made in sections having different diameters, increasing from the top so that the second would telescope the first, and the third over the second. The first section was about 6 ins. in diameter, and was permanently attached to a wooden hopper which was fastened to the form or runway over the form, to be filled. The second and third sections had ears attached near the upper ends by which they were suspended in position from the top by light ropes. When working in the bottom of the pit the tube was extended its full length, and as the form was filled the sections were pulled up out of the way. This proved to be a very satisfactory method, very little of the facing being lost, as was done when it was dumped into the pit from the top.

The facing was put up against the surface with the back of a shovel or a trowel in the shape of a wedge, which was about 1½ ins. thick at base, and about 1 ft. high. When tamped, this would give about 1½ ins. of facing. A board was placed in front of this wedge of mortar to protect it from the rocks and pebbles that scattered from the concrete as it was being dumped into the pit.

The concrete having been deposited, the protection was removed, the concrete leveled off and tamped together with the facing. Care was taken to keep the coarse rocks away from the face, the finer part being placed next to the fine stuff. This operation was repeated for each course until the form was filled to within ½-in. of the top, when the coping was given a side-walk finish. The edge was struck off with an edging tool having a radius of about 1 in. The coping was given a crown of about ¼ in., and as the cement was taking its initial set, the surface was rubbed down with a float, giving a sand finish.

In order to give a more finished appearance at the joints between two adjacent sections, a triangular moulding or "bead" ¾ in. on each side, was nailed in the corner formed by the bulkhead and the front of the form. When the first section was completed, and the bulkhead torn out, the bead was left in position and a second one was fastened next to it. In the finished wall this gave a vertical mark ¾ in. deep and 1½ in. wide on the face, half being on each section.

Beads were placed at all small corners where the edges would be seen in the completed work, such as treads and risers of step, recesses, etc. At the more important corners such as at the ends of the lock walls, a large bead or "corner board" was placed. It had a face of 12 ins. and was placed at an angle of 45° with the face of the wall.

Force Employed.—The following is a list showing the average number of men of the various classes employed per day of 8 hours, and the part of the work performed by each:

Hauling lumber, building and wrecking forms and other miscellaneous carpenter work	1 Foreman. 8 Carpenters 1 Laborer.
Painting	1 Engineman.
Screening sand	1 Laborer. 1 Laborer.
Hauling cement	1 Teamster with team.
Hauling coal, etc	1 Engine crew
Carrying water	1 Water boy.
Miscellaneous work	1 Laborer
Mixing and Placing Concrete	
General overseeing	1 Foreman.
Filling and tending crusher rock car	1 Laborer
Shoveling gravel	5 Laborers.
Hauling crushed rock and gravel	1 Teamster with team.
Handling and measuring cement	2 Laborers.
Pushing charging car	2 Laborers.
Wetting concrete	1 Laborer.
Running mixer	1 Engineman.
Tending mixer	1 Laborer
Pushing concrete cars	3 Laborers.
Mixing facing	2 Laborers.
Hoisting concrete	1 Engineman.
Wheeling facing	1 Laborer.
Putting on facing in pit	2 Laborers.
Distributing concrete	3 Laborers.
Tamping concrete	7 Laborers.

Total, 1 Foreman, 2 Enginemen, 1 Team and 30 Laborers.

Foremen were paid	$100.00 month.
Enginemen were paid	60.00 month.
Carpenters were paid	2.50 day.
Laborers were paid	1.75 day.
Water boys were paid	.75 day.
Teamsters with teams were paid	3.00 day.

Program and Progress of Work.—The first concrete in the walls was deposited in the north end of the east wall of the lock. Those portions of the walls 17 ft. high were first built, with the exception of the bridge seats, the construction of which was deferred until after the low walls were built. The concrete tracks were then lowered and the rails laid on 3x12-in. plank on top of the finished walls and extended onto the forms for the lower walls.

On the low part of the east wall the sections averaged about 70 cu. yds. Work on one of these sections began promptly at 8 o'clock A. M., and the section was usually filled by half past two, allowing 30 minutes for dinner. This made an average of about 11½ cu. yds. per hour. The organization was then broken up, part of the men put on the top dressing of the section just filled, part cleaned the form for the following day, some hauled cement, others excavated for foundations of sluice gates, loaded rock on cars for crushing, and did other miscellaneous work. On the west wall the sections averaged about 55 cu. yds. and as the miscellaneous work had been about finished, the concrete work was continued throughout the day. One section was completed and as much deposited in the second as possible. In this way about three sections were completed in two days. Two days were used in filling the larger sections. The largest day's work was 105.5 cu. yds., which required nine hours to complete.

Concrete work was begun on September 29, 1902, and was finished November 10, 1902. Three days were lost on account of rain and three days were used for excavating rock.

Quantities and Cost.—The total amount of Portland cement concrete, including the part in mitre sills which was mixed by hand, was 2404.7 cu. yds., and the total cost was $15,584.80, which would be $6.48 per cu. yd. The above price does not include the cost of engineering and plant, which would be about 10 cts. per cu. yd. for each item. Following is a table showing the various items of cost:

COST OF PORTLAND CONCRETE MASONRY AT GUARD LOCK, FEEDER.

Labor—	
Erecting and wrecking forms	$1,434.63
Building trestles	85.14
Building cement shed	49.26
Constructing concrete cars	42.00
Unloading and hauling lumber	177.28
Track work	178.43
Mixing and placing concrete	2,557.89
Setting up and dismantling machinery	200.49
Unloading and hauling cement	137.03
Setting up pump and pumping	147.34
Miscellaneous work	48.95
Bills—	
Coal	$ 102.00
1,553 cu. yds. crushed rock at 87.6c per cu. yd.	1,360.43
1,600 cu. yds. gravel at 54.4c per cu. yd.	870.40
2,571.3 bbls. Alpha Portland cement at $2.79 per bbl.	7,173.90
Lumber, 33⅓% of original cost	813.34
Miscellaneous bills	141.94
Total cost of 2,404.7 cu. yds. concrete	$15,584.00
Cost per cu. yd.	$6.48
No. bbls. Portland cement concrete per cu. yd.	$1.07

The Portland cement was purchased at a time when cement was exceedingly high. It cost the United States $2.79 delivered at Rock Falls, Ill. The following year cement was bought at almost half the above price.

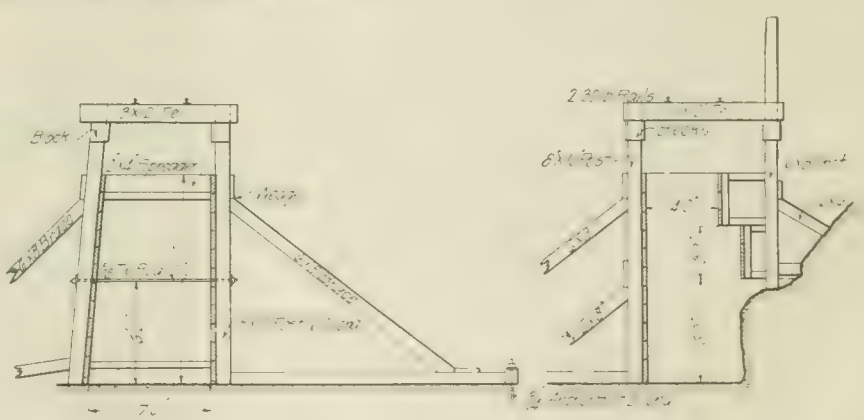

Fig. 2—Sections of Forms for Concrete Lock Walls.

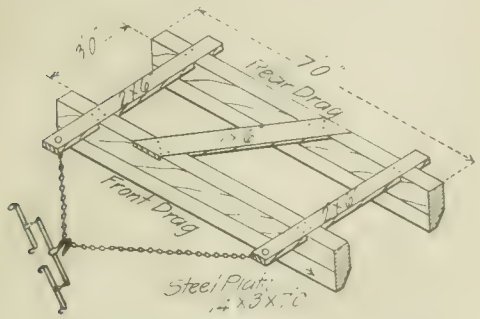
The 79.9 cu. yds. of natural cement concrete cost $403.21, or $5.05 per cu. yd. The above article is compiled from data furnished by F. W. Honens, U. S. Engineer Office, Kansas City.

"Home-made" Road Drag.—There are several types of "home-made" road drags now in use in the maintenance of certain roads. The most commonly used of these are the split log drag, the plank drag and the lap plank drag. Many drags are dodged so that when pulled at an angle they will exactly track, but when drag is made in that manner it can be used only to go one way on one side of the road. In a recent bulletin of the Southern Appalachian Good Roads Association, Mr. W. L. Spoon, Highway Engineer, North Carolina Geological and Economic Survey, describes a drag which can be used up and down and back and forth on either side of the road. His description of the method of constructing and using this drag follows: After the pieces are set up as shown in sketch, a piece may be tacked across the ends to hold them in place while sawing and fitting in the tie pieces. To fit in the tie pieces, lay them on the drags 8 ins. from the ends and mark the drags carefully so that when the places are sawed and chipped out for the ties, they will fit in tightly. It is a good plan to make them so tight that they must be driven in with a hammer, for then the nails will hold much better. After the two drags have thus been joined, and the two ties set in as shown in the cut, nail them securely with five 40-penny nails at each place, as indicated. These ties should project 12 ins. over in front and 6 ins. in the rear. A 2-in. hole should then

be bored in the front end of the tie, as indicated. This hole is for the chain to pass through a hitch. Next lay the brace piece on and mark carefully, as shown, then cut and fit the brace in tightly and nail securely with 20-penny nails. If the directions have been followed carefully, it is now ready to turn upside down. When turned, hew the back bevel on the drags with an axe, as shown in the cut, leaving the front edge of each drag one inch thick. While it is still in this posi-



Construction of Road Drag Used on North Carolina Road Work.

tion, nail securely the two steel plates so that they will extend about ⅛ in. lower than the face of the drag. This is done for the reason that the steel will have a better chance to get hold of the road and move material than it would if it were placed flush. When this has been done, turn the drag right side up and it is ready for the chain and to be put to use. To put the chain on, pass it around the tie as indicated, and down through the hole in the end of the tie, then up through the hole in the end of the second tie and around it, behind the drag, as shown in the cut. The stretcher hook may be hitched in at any place desired to give the angle to the drag that is desired. This drag will work either end forward, simply by a change in the hitch. All that is necessary is to move the hook on the chain. A little practice will soon make any one proficient in the use of this drag. To operate it, throw a board 6 ft. long and 10 or 12 in. broad on the ties and brace, about midway between the drags. This is for the driver to stand on. It will be interesting to notice the effect of the driver changing his position on the drag. Step one foot on the front of the drag, and it will cut and carry material until the weight is removed; step back on the rear drag and the front one will drop its load and the rear one catch it. Step forward again and the latter drag will drop its load. In this way a little practice on the part of the driver will enable him to become very proficient in filling up holes. If it is desired to crown the road up, stand with superior weight on the front and a little to the ditch end of the drag and let the drag have an angle of about 45 degrees.

Stone for Road Repair Work.—For several years the State Highway Department of Connecticut has caused to be furnished at the completion of every state road contract a supply of crushed stone of ½ to ¾ in. size, for top dressing, to be used as required in repairing the road. On all contracts now in force, the amount of stone named in each contract for future repairs is arranged for on the basis of 100 tons per mile of road constructed, and before any contract is accepted, the contractor is obliged to furnish and stack this amount of stone where directed by the Town Selectmen. The contractor is required to place this extra stone in a neat formation not exceeding 5 ft. high with the stone trimmed up neatly into a compact form.

The Long Branch Pier & Land Co. has awarded the contract for the superstructure of its pier at Long Branch, N. J., to Jesse A. Howland, Seabright, N. J., at $158,000. John B. White, of Long Branch, was given the contract for erecting the buildings on the Ocean Park grounds.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

The North Shore Channel of the Sanitary District of Chicago; Methods and Some Costs On Sections Four and Six.

The North Shore Drainage Channel, which has been under construction for about two years, is scheduled to be in operation by the end of the year. This canal was described in ENGINEERING-CONTRACTING of Aug. 4, 1909, and the methods and costs of constructing Section 1 of the canal were then given.

The channel is 8¼ miles long and extends from Lake Michigan, at Willmette, southwardly and westwardly to the North Branch of the Chicago River, at Lawrence Ave. The average cross-section is about 140 ft. wide on top, 26 ft. wide at the bottom and 28 ft. in depth. The water area will be 720 sq. ft. and about 13.6 ft. deep. The entire sewage from the district bordering the north shore of Lake Michigan from Lawrence Ave. to Willmette, will be turned into the channel when completed.

For construction purposes the channel was divided into twelve sections. Number 1 being at the north end and Number 12 at the south end of the channel. At the beginning of the work, only a part of the right-of-way had been secured, and also during the second year operations were handicapped by the excessive rainfall. In spite of these and other troubles, however, the work has now been about two-thirds completed, and is well organized for the balance of the construction to be done.

Sections Numbers 4 and 5, under contract to James O. Heyworth of Chicago, have been completed. The top-soil on both these sections was excavated with team and drag scrapers. In this way 47,000 cu. yds. were removed from Section 4, and 21,000 cu. yds. were removed from Section 5. The balance of the cut was made with Heyworth-Newman excavators, one machine working on each section. These machines are designed and operated by Jas. O. Heyworth, who has patented the machine and bucket and is manufacturing them.

This machine is built to operate from the bank. Its whole weight is balanced upon a portable turntable. As shown in the accompanying views, Figs. 1 and 2, of the machine, the boiler and engine are housed on the turntable so as to balance the 100 ft. steel boom, which handles a three-yard bucket. When in operation the entire machine revolves on the turntable and is able to handle anything within a radius of 110 ft. The manner of filling the bucket differs from the method of filling most buckets in the fact that this bucket is made to dig up, or, in a direction toward the machine, instead of down and away from the machine. The bucket is placed with its nose toward the machine and the drag-line wound in on the drum until the bucket is filled. This forward motion is continued by raising the bucket on the load line. Simultaneously with the raising of the bucket, the boom is set in motion by the revolution of the machine on the turntable, and the bucket is dumped when the boom is over the spoil bank without stopping the revolution of the machine. When running steadily, on dry work, about 800 to 850 revolutions are made in 24 hours.

The advantage of using a bucket which digs in an upward direction is shown in the view, Fig. 2, of one of these machines excavating in 14 ft. of water. This picture was taken on Section 12, at the junction of the canal with the North branch of the Chicago River. Any bucket which digs in a downward direction would be impractical here as the action of the water, and the reversal of motion would tend to loosen the load before the bucket had attained an upright position. It requires, however, an experienced operator to get a smooth finish on the slope of the cut, and also, to be able to place the bucket under water so as to get a bucket-full of material.

The records of the work on Sections 4 and 5, according to the estimates of the engineers, are given here. These sections were in dry excavation, all material being stiff blue clay.

Fig. 1—Heyworth-Newman Drag Line Excavator Excavating Dry.

These figures are the engineer's estimates and show the amounts allowed on the monthly estimates to the contractor. The figures may vary a little from the actual number of cubic yards taken out by the machine in any one month, because of the variation of time of

taking cross sections, but the average yardage per month for the 16 months' work on Section 4, and 8 months' work on Section 5, may be considered as nearly correct for the capacity of the machines. This would be, on Section 4, an average of 31,191 cu. yds. per month, and on Section 5, an average of 25,214 cu. yds. per month.

Section 4.

	Cost per cu.yd.
Labor	0.061
3 tons coal per day	0.010
Repairs and miscellaneous supplies	0.048
15% annual interest on $15,000 plant	0.006
50% annual depreciation on $15,000 plant	0.02
Total cost per cu. yd.	$0.145

Fig. 2—Heyworth-Newman Drag Line Excavator Excavating Under Water.

An estimate of the cost of labor for one machine is as follows: No consideration is taken of interest on contractors' bond, insurance, or of general office expense. The work is divided into three shifts of 8 hrs. each for the operators, and two shifts of 12 hrs. each for the balance of the crew. The work is carried on 6 days a week or 25 days a month. The figures were obtained by the editor while going over the work and are given according to the information furnished him. He believes, however, that the crew given for each machine is too large. It would be more nearly correct to eliminate the items of mechanic, blacksmith's helper and oiler; and to

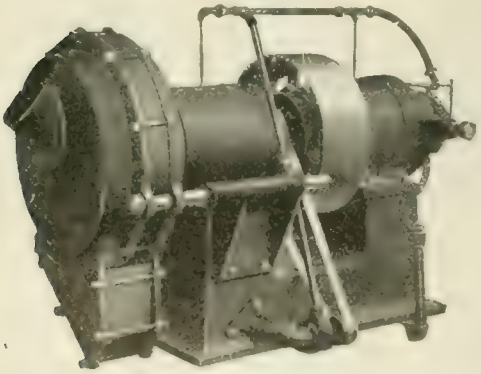

Fig. 1—View of Symons Disc Crusher: a New Type of Stone Crusher.

divide the blacksmith's time between three machines.

12 laborers at 20c per hr., per month	$ 720.00
3 operators at $150 per month	450.00
2 firemen at $90 per month	180.00
1 man and team at	125.00
1 supt. to 2 machines at $200 per month	100.00
1 [illegible] engineer and [illegible] per month, 2 machines	67.50
1 [illegible] 3 machines at $150	[illegible]
1 [illegible] per month	[illegible]
1 blacksmiths' helper, per month	50.00
1 oiler, per month	60.00
Total	$1,892.50

Using 31,191 cu. yds. excavated for Section 4 and 25,214 cu. yds. excavated for Section 5, the costs per cubic yard are estimated as follows:

Section 5.

	Cost per cu. yd.
Labor	$0.076
3 tons coal per day	0.012
Repairs and miscellaneous supplies	0.059
15% annual interest on $15,000 plant	0.007
50% annual depreciation on $15,000 plant	0.030
Total cost per cu. yd.	$0.184

The labor item includes all work done, such as repairs, moving machine, and actual excavation.

The repair and miscellaneous supplies item is large. It contains new cable, oil, renewals and 2 miles of 2-in. pipe to supply water to the boilers. The strains and work demanded of large drag-line machines are heavier than that of steam shovels. The average repair and maintenance bill has been $1,500 per month.

The work on the remainder of the canal is being rushed. The two machines described above and one other of the same type, are now at work on Sections 8, 9 and 12, and it is expected that the work on these sections will be completed by Sept. 1, 1910.

A New Type of Stone Crusher.

The accompanying cuts show the general appearance and the main operating parts of a new type of stone crusher that has recently been tried out with successful results. This crusher is styled a disc crusher and its operating principle is distinctly novel. Briefly, the crushing parts consist of two saucer-shaped discs of manganese steel, set at a slight angle to each other and rotating at the same speed, in the same direction. A stone is fed in between the discs and drops until it lodges near the bottom, where it is caught and revolves with the discs. As the discs revolve, opposite points approach each other on the upward part of the revolution and recede from each other on the downward part of the revolution. This approaching together and receding apart of the space between discs is due entirely to their being set at an angle; the discs themselves do not vibrate or move sideways. It is plain that the stone revolving with the discs will be crushed as they approach on the upward part of the revolution and that the fragments will, as the discs recede on the downward part of the revolution, drop still farther into the wedge-shaped space and be again crushed as the space contracts on the next upward part of the revolution. This process is repeated until the fragments are small enough to pass the open space between the edges of the discs. It will be seen also that the fragments of stone are not acted on by gravity alone in passing out from between the discs; they are hurled out by the centrifugal force due to rotation. As shown by Fig. 1, a hood envelopes the crushing discs and catches the fragments as they escape from the discs. This hood is stationary and has a spout at the bottom to deliver the stone.

The construction by which the operation described above is obtained is best understood by referring to Fig. 2, which shows the operating parts of the crusher. In Fig. 2, *A* is a hollow shaft, mounted in two bearings, *BB*. One end of shaft *A* is enlarged and threaded and to it is screwed the cap *C;* this cap has cross-arms, *D*, between which the material escapes. Inside the cap, *C*, is fastened one of the crushing discs *E;* this disc is fixed to the shaft and revolves with it. Inside the hollow shaft, *A*, is a solid shaft, *G*, which has a half-ball enlargement supporting the crushing disc, *F*, and fitting into the enlarged socket end of the hollow shaft, *A*. The tail end of shaft *G* extends out beyond the end of shaft *A* and has an independent bearing, *H*, which is provided with screws to alter the alinement of shaft *G* and so vary the angle between crushing discs. Now when power is applied to the belt pulley, *I*, the hollow shaft *A*, its cap, *C*, and the attached disc, *E*, will revolve. The inner shaft, *G*, and disc, *F*, tend to revolve due to the friction of the ball head with the socket of shaft *A*, but they are not driven positively when the machine is running idle. Immediately stone is fed between the discs, the crushing action already described increases the friction between ball and socket and the two shafts and their attached parts revolve together.

These crushers are built in three sizes having 48-in., 24-in. and 13-in. discs. The 48-in. machine will take 7-in. stone and reduce it to any size between 3 ins. and ⅝ in. Its rated output of 1-in. stone is 50 to 90 tons per hour. These crushers have been used successfully in a number of places. They are made by Symons Brothers, Old Colony Building, Chicago, Ill.

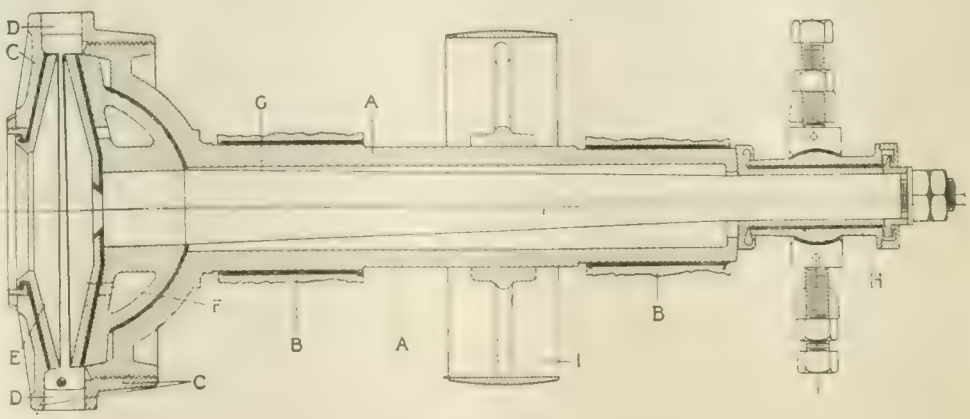

Fig. 2—Operating Parts of Symons Disc Crusher.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Methods of a New York State Commission of Highways in Testing Bituminous Materials Used in Road Work.

The testing of all materials submitted for use in the construction of state highways in New York is done under the direction of the Bureau of Research of the State Commission of Highways. In 1909 there were tested in the laboratory of the Bureau 330 samples of stone proposed for use on 110 separate roads, aggregating approximately 600 miles. This material was from all parts of the state and of many different classes of stone. The cost of stone sampling was $8.55 per sample, this including the cost of collecting each sample. The average time necessary for making tests was five days. The bureau also sampled and tested 2,003 samples representing 20,003 bbls. of cement from a total of 163 lots, the cement was used on 95 roads throughout the state. Forty-eight samples were rejected. The cost of the testing averaged 5 cts. per barrel of cement used. In addition 2,640 samples of bituminous material comprising 721 lots were tested; 496 of these lots were of asphalt and road oil representing 2,900,000 galls., while 225 lots were of rock asphalt taken from 205 carloads, approximately 8,100 tons. The cost of this sampling was at the rate of $8.05 per lot or approximately 7¾ cts. per barrel of material represented by the test. The cost of this sampling was at the rate of $8.05 per lot or approximately 7¾ cts. per barrel of material represented by the test. Of this 4 cts. was laboratory work and 3¾ cts. represented the cost of factory sampling and office expenses properly chargeable to this test. In the last annual report of the State Commis- of Highways the methods of making the above test are described, and we have abstracted from this report the following matter relative to the testing of bituminous material:

Sampling.—Samples of bituminous material for use on construction work were sampled either before shipment from the plant or immediately upon the arrival of the material at the road. When material was sampled from a car upon its arrival at or near the road one sample was taken by the engineer on the road for approximately every twenty barrels of material received. These samples were shipped to the Bureau of Research in standard pint cans furnished for the purpose, together with the information shown in specimen Form 1. In this and the other forms the matter in black is given to show the method of filling out the forms:

Rd. No. 795.

State of New York,
DEPARTMENT OF HIGHWAYS.

To the Engineer in Charge, Jeffersonville, N. Y.
Bureau of Research, Albany, N. Y. August 11, 1909.

Dear Sir:—I have this day shipped 3 carefully and securely wrapped samples (Nos. 22 to 24) representing 65 Bbls. of Texaco Macadam Binder for Rd. No. 795.
Sampled From L. V. Car No. 32425 at Collicoon.
on August 11, 1909, by C. B. Smith, Asst. Eng.

FORM I.

Samples shipped from the oil plants were secured by inspectors of the bureau stationed there for that purpose. The samples were taken as the material was run from the stills into the barrels, tank cars, or other receptacles in which it was to be shipped or stored. A pint sample was sent in for approximately every 20 bbls. of material as was done on the sampling at the road. Shipments were made from some plants directly after sampling. In such cases notification of the acceptance or rejection of the material was mailed direct to the division engineer in whose division the material was to be used. In other cases material was held at the plants until receipt of notification of acceptance, after which shipment of the accepted material was made. This material was ready for immediate use upon its arrival at the road. Notification of each shipment of such material was made by the inspector at the plant on Form I, which, upon receipt at the Bureau of Research was approved and forwarded to the division engineer in whose division the material was to be used.

B. R. Sample No. 732.

State of New York,
DEPARTMENT OF HIGHWAYS.
Bureau of Research, Albany.

Mr. Guy H. Miller,
Engineer, Division No. 3.
Watertown, N. Y.

Bayonne, N. J.,
August 11, 1909.

Dear Sir

There has this day been shipped 2 Cars of N. Y. State Road Binder Spec. No. 1.
The designation of this material is Utica, County of Oneida.
It is consigned to Smith & Green Construction Co.
For Use on the Utica-Bridgewater Road, Road No. 599.
This material is from Tank No. 532, Plant of Standard Oil Co.
This material has passed the required test and was accepted by the Commission August 9, 1909.
This material has been shipped in officially sealed cars which should arrive at their destination in good condition. The seal shall be broken and the car opened only in the presence of the engineer in charge of the road on which the material is to be used.
R. R. Name on car is L. V. No. of car is 32,453. No. of bbls. in car is 65.
R. R. Name on car is N. Y. C. & H. R. R. No. of car is 42,211. No. of bbls. in car is 65.
Approved. A. F. Armstrong,
Engineer in charge Bureau of Research, August 12, 1909.
Chas. B. Smith, Inspector.

FORM II.

Laboratory Equipment.—The oil testing laboratory in the basement of the building used by the Highway Commission at Albany, is fitted up with modern equipment for four workmen. This equipment consists in general of work tables; three analytical balances; three scales, with capacity of from 0.1 gram to 500 grams, 0.5 gram to 2 kilograms, and ½ oz. to 240 lbs., respectively; 2 heating ovens; 1 N. Y. pentrometer; 1 hot plate; 1 Wespath balance; 5 iron retorts, ½ pt. to 4 pt. capacities; 1 Engler viscosimeter; 1 Saybolt viscosimeter; 1 float sink; thermometers ranging in temperature recorded from —25° F. to +1050° F.; set of 8 hydrometers, giving the degree Beaume from 10 to 90; extraction apparatus; hot water bath; closed flash Tester (New York State pattern); freezing apparatus; water still; distilling apparatus for other liquids; nest of 12 sieves for the mechanical analysis of sands in natural and artificial mineral bitumens. Besides these larger pieces of apparatus are the smaller things necessary in a chemical laboratory, such as platinum and porcelain crucibles; funnels; beakers; graduates; pipettes; burettes; flasks, etc.

Bituminous Material Used.—There were five different specifications governing the bituminous materials used as road binders during the season. Specification No. 1 called for material to be applied on the broken stone top course of the road under construction at temperatures between 250 and 300° F. Material passing specification No. 2 was generally used in the same manner as the above mentioned material. It was, however, a heavier, denser material than that passing specification No. 1, and was generally applied at somewhat higher temperatures. The temperature at which any oil is applied depends considerably on the temperature of the weather at time of application. Specification No. 3 called for a heavy asphaltic oil, somewhat lighter than that specified in specification No. 1, which when heated to 200° F. was applied by sprinkling or other means, to the surface of roads being constructed or repaired. For satisfactory use of this material it was essential that the road surface be thoroughly cleaned and that the application be made in warm summer weather. Specification No. 4 called for a lighter oil than any of those above mentioned, which was applied by sprinkling to the cleanly swept surface of the road at air temperature. The cleaner the road surface and the warmer the air temperature the more satisfactory the application. The fifth specification was for a natural rock asphalt and stated that the material should contain not less than 7 per cent of bitumen.

Testing.—In each of the four first mentioned specifications there are 12 distinct tests which the material is required to pass. These tests are determinations of (1) water present, (2) homogenity, (3) specific gravity, (4) penetration at 77° F., (5) penetration at 77° F. on a certain per cent of residue, this per cent of residue varying for the different specifications, (6) loss on heating for five

hours at 325° F., (7) loss on heating for five hours at 400° F., (8) per cent soluble in carbon disulphide, (9) per cent soluble in 76° naphtha, (10) amount fixed carbon present, (11) closed flash point, (12) per cent of paraffine scale present. Besides these required tests, some of all of the following named tests were made on the greater part of the material used. Tests for viscosity, time of float tests at various temperatures, penetration at various temperatures, solubility in carbon tetrachloride, fire point, open flash, percentage of coke left upon destructive distillation, etc., etc.

Briefly, the amount of work required for one set of tests might be stated as follows: Twenty-one weighings made to the accuracy of 0.0001 gram, 11 weighings made to the accuracy of 0.1 gram, observations of the character of the material made at seven different temperatures, viz.: 0° F., 77° F., 212° F., 325° F., 400° F., 500° F., and the unknown temperature required for flash. The temperature of 0° F. is obtained by using an intimate mixture of finely cracked ice and salt in water. Variations in the proportion of water, salt and ice give various temperatures from 30° F. to —3° F. A mixture of ½ gal. of water, 15 lb. of finely cracked ice and 5 lb. of common dry salt will give a temperature of 0° F. On the lighter oils the fire point is usually noted. Three filtrations are necessary. The average time of testing a sample is 2.2 days as computed from the records of tests which show that

127	tests were completed in	1	day.
354	tests were completed in	2	days.
98	tests were completed in	3	days.
38	tests were completed in	4	days.
26	tests were completed in	5	days.
1	test was completed in	6	days.
5	tests were completed in	7	days.
1	test was completed in	10	days.

The tests that were completed in one day were principally those of Kentucky Rock asphalt. The tests completed in two days were chiefly material submitted for specification No. 2. Tests on material submitted to meet specification Nos. 3 and 4 frequently required a longer time than two days. A sample received at the close of work on one day and reported at the beginning of work the second day following has been figured as two days in the test, although it was actually in the laboratory but one working day, and as the above given figures make no deductions for material held in the laboratory over Sundays and holidays it may be seen that the actual working time taken for testing a sample was generally between one and two days. The length of time that expired from the time that the different lots of material were sampled until the samples were received at the laboratory was as follows:

83	lots received 1 day after sampling.
253	lots received 2 days after sampling.
145	lots received 3 days after sampling.
54	lots received 4 days after sampling.
19	lots received 5 days after sampling.
9	lots received 6 days after sampling.
2	lots received 7 days after sampling.

The average time elapsing between the sampling of this material and its receipt at the laboratory being 2.5 days. This material was sampled in various parts of New York State, at Philadelphia, Pa., at Bayonne and Maurer, N. J., and at Chicago, Ill. It may be seen from the above figures, for time necessary for receiving and testing samples, that the results of tests are on the average obtainable from the laboratory in 4.7 days from the time the samples are shipped, but at least a period of 6 days should be allowed from the time of taking samples at nearby points until report is received, and a day or two longer for samples taken at distant points.

Upon completion of tests the results thereof are submitted to the Commission. The proper party is then notified of the action taken regarding the use of the material, and the results of tests filed in the bureau on Form II which contains specimen information.

Road Surface Treatment With Oil in 1909 by the New York State Commission of Highways.

Early in the spring of 1909 the New York State Highway Commission realized that something must be done to preserve and hold the macadam roads which had been constructed and which were in comparatively good condition but were subject to extremely heavy automobile traffic and which were already beginning to show rapid deterioration. After considerable study and some experimenting it was decided to use an asphaltic oil, and accordingly approximately 380 miles on macadam highways were given a surface treatment with oil during the year.

Sample No. 902.

State of New York,

DEPARTMENT OF HIGHWAYS.

Bureau of Research, Albany.

Taken August 11, 1909. Received August 13, 1909. Road No. 795.

Taken by C. B. Smith, Asst. Eng., at Callicoon marked his sample Nos 22-24.

LV car No. 32,425.

Trade name Texas Macadam Binder,

Manufactured by Texas Company.

Address of manufacturers 17 Battery Place, N. Y. City.

RESULTS OF TESTS.

1	Water present	None.	7 Per cent loss, 5 hrs. 400° F.	1.8	12 Per cent of paraffine 0.5
2	Homogeneous	Yes.			13 Sol in CC1 99.8
3	Specific gravity	13.0	8 Per cent soluble in CS_2	99.80	14 Float at 150 F. 130 sec
4	Penetration at 77 F	240	9 Per cent soluble in naphtha	80.00	15 Pen at 41° F 80
5	Pen. of 94 per cent residue	98	10 Per cent fixed carbon	8.00	16 Flash pt. open 450°
6	Per cent loss, 5 hrs. 325° F.	0.8	11 Flash point Closed	400°	17 Fire pt. 500°
					18

Remarks The figures given above are merely specimen figures and do not pertain to any particular make of material.

Material —— approved for Spec. No. 1, August, 15, 1909, by X X X

Engr. in Charge of Bureau.

FORM III.

The oil was applied at the rate of from 3/10 to ½ gal. to the square yard and was covered after allowing for a period of three to four hours' penetration with from ½ to ¾ in. of screenings with the dust removed, ¾ in. stone, Lyon mountain tailings or the best grade of gravel obtainable in that vicinity. Experience has demonstrated that it is very necessary to obtain a high grade of covering for the oil after this application. In many cases the gravel has not proved entirely satisfactory. The use of stone screenings with the dust removed and ¾ in. stone has given very satisfactory results. The use of Lyon mountain tailings which are the refuse produce of the ore mines situated on the D. & H. railway in the northeastern part of the state has also proved very satisfactory. The material to be suitable for this purpose should be gritty. It is not essential that material should have any particular binding qualities. The success of the oil treatment depends largely upon the skill of the application. It is, of course, important to have first class materials, but the manner of application is also just as important. The use of asphaltic oil and cushion preserves the road from rapid deterioration and eleminates the dust nuisance.

According to the last annual report of the State Commission of Highways, from which these notes have been taken, the work throughout the state, which has been distributed in almost every country in the state, has been generally satisfactory and as a method of preserving macadam roads which have already been constructed and which are in comparatively good condition may be said to be a very successful treatment. Roads which would have been entirely destroyed by the end of the season are preserved and will go into the winter in good condition. The use of oil and covering is especially effective in preventing raveling. Many of the roads in the state of New York have been constructed with stone which has no special binding qualities and which have heretofore raveled badly during the hot months of the summer. A number of these roads were treated with asphaltic oil during the past summer and have given absolutely no trouble in this respect since the application. In most cases the oil was applied cold during the hot months. In some cases it was found necessary, especially in the fall of the year, to heat this oil. The oil was delivered in tank cars and pumped into oilers which were especially constructed for the purpose of distributing oil. A portion of road No. 241, running from Ballston Springs to Saratoga Springs in Saratoga county, was treated with this oil early in June. The remaining portion of the road was treated with a heavier oil, viz., New York state binder No. 1. and covered with gravel to a depth of about ¾ in. Both portions of this highway have been subject to extremely heavy automobile traffic during the year and both sections were in exceptionally good condition this fall. While the portion covered by the heavy binder perhaps had little penetration, a surface coat was formed over the macadam which protected the roadway. The treatment with the heavier grade of asphaltic oil and covering is considerably more expensive than the treatment with the oil which can be applied cold. Time will demonstrate whether or not this form of repair work will or will not be the cheapest in the long run. One of the principal reasons for the selection of the treatment of the roads with a grade of oil which could be applied cold was the fact that this treatment was about the only treatment which would come within the appropriations available. It has been generally considered that the macadam surface to be treated should be absolutely dry. In a number of instances very good results have been obtained where the oil was applied when the road was damp, but not wet or muddy. (In some cases this condition occurred after rain; in one or two a sprinkler was used before the oil was applied). Greater penetration was obtained and less cover was needed and the final results were even better than many cases where the oil was applied to a dry surface. One of the most important points to be ob-

served in this surface treatment or so-called painting method is that the surface should be swept as clean as possible. This can best be done by the use of a rotary horse sweeper.

The cost of this treatment varies greatly with cost and amount of material used, freight rates, etc. Experience has shown that for a 16-ft. roadway approximately 3,700 gals. of oil should be used to the mile or about 4/10 gal. per sq. yd. This amount will depend somewhat upon the character of the stone in the roadway, some stone affording better penetration than others. The above figure of 3,700 gals. to the mile on a 16-ft. roadway may be said to be a fair average. If an excess quantity of oil is used it will require more covering material, which will unite with the oil, forming a thick cover which is inclined to rut and become sloppy in bad weather. The cost is also greatly increased and no advantage gained. It will require approximately 75 to 100 cu. yds. of covering for the above application. The following may be considered an average estimate of the cost of the oil treatment upon one mile of 16-ft. roadway:

3,700 gallons oil at 4 cts. f. o. b. station	$148.00
Applying 3,700 gals. of oil at 1½ cts. per gallon	55.00
100 cu. yds. covering (gravel, screenings or three-quarter stone at $1.75 delivered on the road)	175.00
Sweeping	14.00
Sanding after oiling	30.00
Total	$422.00

This equals a cost of 4½ cts. per sq. yd.

The covering selected for this class of treatment should be of a gritty nature, free from dust. If gravel is used it should be of a superior quality, free from loam or dust. Gravels containing shale or slate should particularly be avoided. A very large portion of the gravels of New York state are unsuited for this work.

The oil used in the surface treatment work was furnished by the Standard Oil Co., Indian Refining Co., Gulf Refining Co., and the Texas Oil Co. Approximately 1,400,000 gals. of this grade of oil have been applied to roads during the season.

The Consumers' Power Co., with a capitalization of $20,000 000, has been incorporated under the laws of Maine. The company was organized at Portland to manufacture, produce, generate, transmit, distribute and supply electricity for lighting, fuel or other purposes. The incorporators are James R. Parsons, William M. Bradlev and A. G. McPherson, all of Portland.

A Shaft Sinking Record.—Starting at a depth of 365 ft. on March 3, 1910, the No. 1 shaft on the Moodna siphon of the Catskill Aqueduct was deepened 177 ft. to April 3, 1910. This shaft is circular, with a minimum allowable radius of 7 ft. 11 ins. The average diameter is about 16 ft. 8 ins. The shaft was sunk with two 8-hour mucking shifts and one 8-hour drilling shift daily. Nineteen shifts were worked per week, two being lost on Sunday. The rock penetrated was hard Hudson River shale. A liberal bonus contributed to the progress. The work was done by the Mason & Hanger Company, contractors to the city.

Engine Foundation of Concrete Blocks.—In a foundation recently built for the outboard pillow block of an engine the blocks were made in two machines, one making 8 x 12 x 24-in. blocks, and the other, 8 x 8 x 16-in. blocks. Odd size blocks were made by putting fillers into the block machines. The foundation had six courses, the top one measuring 16 x 32 in. in plan, and the bottom one 28 x 44 in. The stepping was done in three 2-in. steps. The holes in the blocks were filled with grout and 2-in. pebbles, and in four of them anchor bolts were placed. Joints in successive courses were broken in all directions, both by odd-sized blocks and different methods of laying the courses, so that the entire mass was well bonded. The blocks were mixed with 1:5 proportions, using gravel having a maximum size of 1 in.

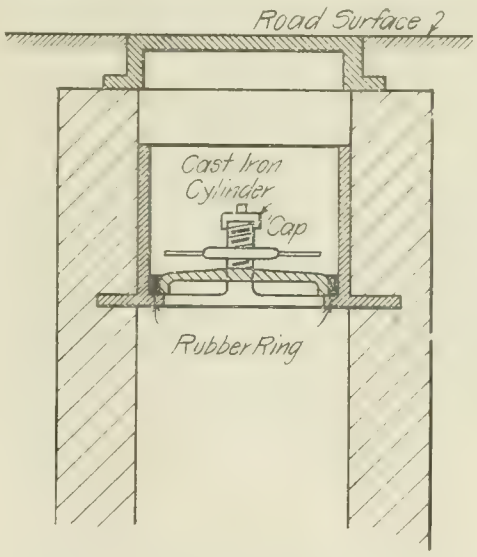
Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

A Method of Preventing Sewer Flooding in Riverside Districts.

An interesting method has been put into use at Sunbury, England, to prevent sewer flooding. The city has a long river frontage, on which are five or ten intakes of the Metropolitan Water Board of London, so extreme care is necessary to prevent pollution. The difference in level between the riverside road and the Thames is also very small, and the sewers gravitating to the ejectors at this point come from much higher levels. It, therefore, became very important to guard against any overflow of sewage in case of a stoppage of the ejectors, and to prevent river water entering the sewers through the manhole covers when the Thames was in flood. The manner in which this has been accomplished is described in a recent issue of the Surveyor as follows:

In the shaft of each manhole on the river frontage has been built a cast iron cylinder, 21 ins. diameter by about 18 ins. long, with a square flange at the bottom. On the inside of the cylinder, also at the bottom, a small rebate or fillet is cast. Within the cylinder is



Device for Preventing Sewer Flooding in Riverside Districts.

fixed a 21-in. drain stopper, tightening up with a screw and having an India rubber external ring after the usual pattern. This rests on the small rebate of the cylinder, and is therefore always horizontal and easily tightened, or it may be left slack and lifted out to give access to the manhole below. The stopper is provided with a by-pass and screwed cap, so that if the sewage is up and exerting a pressure on the under side of the stopper, the removal of the cap will at once show the position of affairs, and the cap being of small diameter can be replaced without difficulty or harm having been done. The manhole cover should be slightly larger than the cylinder—22 ins. clear opening being a convenient size—for the removal of the stopper when necessary. The flange of the cylinder should be built in at such a level as to give a sufficient weight of brickwork or concrete above it, so that the cylinder cannot be lifted by the upward pressure; this does not, however, mean a great depth, the frictional resistance on the exterior of the shaft being so high; it is 2 ft. 6 ins. from the surface at Sunbury.

This arrangement has proved equally useful in excluding river water from the sewers in time of flood, and has enabled the ejectors to continue work and clear the sewers; though in the last flood had they stopped they could not have been restarted, as the road was submerged to a depth of 2 ft. The low lying house drains on the riverside are provided with 6-in. sluice valves between the intercepting chambers and the sewer, these valves only being shut when the flood water is actually on the point of entering the house gulleys, etc., and being reopened directly the river subsides below their level. In this way the drainage of the remainder of the district has not been interfered with, and there has been no flooding from river water. Existing manholes have been fitted with the stoppers by removing the shafts to the necessary depth, setting the cylinders and then rebuilding.

Some English Costs of Washing Filtering Material Using a Special Washing Machine.*

For washing of contact clinker beds after being in use for about five years, the washing plant used may be briefly described as follows: It consists of a movable washing tray and riddle, with inclined screens for grading the material, and which is actuated by steam. The ashes are brought from the beds, and are tipped on an elevated platform approached by an inclined roadway or may be elevated by other means and tipped into the jigging riddle (actuated by a vertical eccentric shaft) which has the first part so made as to retain the ashes and water. The water is applied here until the jigging or shaking motion, assisted by bafflers, removes the undesirable matter which the medium contained and which becomes of the same consistency as very liquid sludge. As the material passes on and over a perforated portion so constructed to suit the sizes of media required, water is sprayed on, and so rinses or thoroughly swills away the sludge along with the material which can pass through the size of mesh. This sludge and water immediately drops on to another inclined plane of corrugated iron, and then on to a smaller mesh wire gauze which retains the smaller particles, say ⅛ in., and by a mechanical contrivance carried into a wagon ready for removal. The larger material which has had the sludge and fine media removed, which passing, say, a ¼-in. mesh, passes on to an inclined grating formed by parallel bars, say, 2 in. apart, or whatever size is required, the larger material passing on, and the smaller (say less than 2 in.) passing through into a wagon ready for removal, as before described. The fouled media is therefore not only washed, but graded into three different sizes, each size being placed into a different wagon. The sludge and fouled washing water passes from the washer into a wagon which retains the heavier matter which it contains, while the water and light sludge overflows and passes away by means of channels into specially constructed pits or tanks, where the sludge readily settles, and can be drawn away without disturbing the working of the tanks. The sludge, on being drawn away by means of valves, is conducted to the ordinary sludge channel, and is of the consistency of sewage sludge. This sludge, I may say, readily presses. The water may be used over and over again (if required) after passing the tanks.

The machines are made by Messrs. Ran-

*Extracted from a paper by A. B. Ogden, read before the Institute of Sanitary Engineers, and published in the "Surveyor" for April 8, 1910.

some, Ver Mehr Machinery Co., Caxton House, Westminster, who describe it as a machine for washing and simultaneously grading all classes of material used in the various districts for sewage filtration.

Cost of Working.—Having explained the machine, let me now give you the cost of working. Media which has been in use for, say, five years, can be removed from the bed, washed and returned, including all labor, locomotion, coal, oil, etc., for 12.5d per cu. yd. Ordinary unscreened or crude clinker ashes can be purchased in the Manchester district at 2s. per ton, and in some districts they may be procured even cheaper. Taking the first cost as 2s. per ton:

	£	s	d
Say 100 tons at 2s. material	10	0	0
Add 26 tons for loss in washing, material	2	12	0
Washing 126 tons at 4.26d	2	13	0
Total for 100 tons washed and graded ashes	£15	5	0

Thus we get 100 tons of washed and graded material for £15 5s., or 3.05s. per ton. I therefore consider that it is much cheaper to purchase the clinker ashes in their crude state and prepare them as suggested, as it is obvious that material which is similar and clean, purchased ready for the bed, would cost considerably more than 3s. per ton, which, by the way, is equal to 1.51 cu. yds. This material can be employed for four or five years (perhaps longer), at which time it may be so fouled as to require washing again.

The following is a detailed account of cost, etc., for taking out, washing, refilling the bed, etc. This bed was ½ acre in extent and 3 ft. 6 in. deep, containing 2,823 cu. yds.:

	£	s	d
Emptying the bed	46	10	8
Washing the media	43	19	8
Refilling bed	15	17	10
Locomotives, wagons, etc.	22	12	7
Platelayers (removing roads, etc.)	7	0	8
Repairs (wagons, locomotives, etc.)	5	16	1
Total	£151	17	6

The above figures include tipping and removal of the refuse and general labor in cleaning up, etc.

Now let us consider what we have as a material. We must admit that if any soft or otherwise undesirable material was first employed by taking the crude clinker ashes, after working for four or five years this material must have broken down, so that after washing all undesirable material must have been eliminated, and the material which is returned to the bed must necessarily be a media which has withstood a lengthened test, and therefore must be more suitable than any so-called picked or selected material offered on the market.

Regarding the cost, the original cost of the crude washed clinker is 3.05s. per ton, and the cost for washing and remaking the bed after the same has been in use for four to five years (£151 17s. 6d. for 2,823 cu. yds.) is 1.07s. per cu. yd.

In detail we get a bed containing 2,823 cu. yds, costing £711 10s. 10d., made up as follows.

	£	s	d
Original cost 2,823 cu. yds. at 3.05s.	430	10	0
Cost washing after five years' working	151	17	6
Making good loss of material, 30 per cent	129	3	4
Total	£711	10	10

It may here be noted that the 30 per cent taken as loss on the second washing is a very high figure and would not occur if the crude clinker ashes were taken only from such works as are known to contain a small percentage of soft or undesirable material.

Now we see that after washing, five years' work, and washing again we get 2,823 cu. yds. of what must be excellent filtering media at a cost of £711 10s. 10d., or 5s. .0½d. per cu. yd.

For comparison I give the detailed cost of washing another ½-acre contact bed, the material dealt with being similar to the one before quoted:

	£	s	d
Emptying bed (2,823 cu. yds.)	41	8	11
Washing medium	59	1	6
Filling bed with washed ashes	10	5	10
Locomotion	18	11	8
Platelayers (putting in roads, etc.)	5	13	3
Repairs (superintendence, etc.)	3	9	5
Greasing wagons	1	8	4
Coal for locomotives	3	7	4
Coal for working washer	2	15	5
Engine oil (locomotives)	0	17	0
Cylinder oil (locomotives)	0	5	5
Engine oil (washer)	0	2	6
Cylinder oil (washer)	0	2	6
Wagon grease	1	8	4
Total	£139	17	5

This washer is therefore capable of thoroughly cleansing filtering material at a cost of 4.26d. per cu. yd., and, including the taking out—removing to the washer, washing, returning same to and remaking the bed—cost 11.98d., or, say, 1s. per cu. yd.

This was one of the beds cleaned in favorable weather, which somewhat accounts for the lower cost, but you will see that the cost of this work varies little.

The following is the actual cost in washing the whole of 46 acres of similar beds taken over a lengthened period:

	£	s	d
The labor on 46 acres cost	11,960	0	0
Repairs (locomotives, etc.)	828	0	0
Coals, oils, etc.	782	0	0
Total	£13.570	0	0

The 46 acres, 3 ft. 6 ins. deep, is equal to 259,746 cu. yds. This works out at 12½d. per cu. yd. The time occupied by the washing plant in dealing with one ½-acre bed, or 2,823 cu. yds., was 137¾ hours, but in the foregoing accounts 157½ hours were charged in the labor account, the difference—19¾ hours— being time taken up by the men employed on the washer in tipping and storing the very fine rejected ashes for other purposes. This applies practically to each and every bed. The time charged to the washing account, which is actually outside the cost of washing proper, is about 12.53 per cent of the whole cost for the time the washer worked. The cost does not include interest on capital or depreciation, but does include all cost for repairs and maintenance of plant.

The Results of Experiments on Pollution in Shallow Wells for Municipal Water-Supply.*

This paper presents some notes and observations bearing upon the sanitary character of water of wells used in municipal supplies, referring particularly to so-called shallow wells, or wells deriving their supply from the sands and gravels overlying bed rock. Reference will not be made to accidental sources of pollution, such as defective pipes, although this source is probably more frequent and fraught with more danger than any other. The notes deal particularly with the chances of pollution to travel through the interstices of the water-bearing materials.

It is well known that soils, particularly sands, possess the ability to purify water passing through them to a surprising degree. Ground water in its natural state, necessarily flows from the land to the nearest watercourse, and therefore where this condition of nature is undisturbed, the rainfall, in passinig from its course to the stream, is subjected to a very thorough filtration. Its travel is extremely slow—usually not more than a few inches per day; close to the stream and the ground, depending upon the rapidity of the fluctuations in the stream level.

In the development of a municipal supply, a site is usually selected close to the stream, for the reason that it is at this place that the most favorable deposits generally lie. Further, at this place the ground-water level is most stable, and the elevation of the ground is usually such that the minimum depths and lifts are involved. The operating conditions largely change the state of nature close to the wells. The ground-water plane is commonly depressed considerably below the stream for some distance from the wells, varying with the character of the material, and in such situations a large part of the supply is frequently derived by infiltration from the stream. The writer has observed many situations where the supplying capacity of the inland drainage area and the sub-strata were incapable of furnishing a small part of the supply drawn from wells, and the larger part of this water must have found its source in infiltration from the river bed, although this infiltration may have occurred at a considerable distance from the well.

It is doubtless a fact, where a new well is first drilled close to a stream, that this infiltration is always most rapid where the distance of travel is least, and if this travel is greater than is desirable for filtration purposes the full beneficial effect of the filtration is not secured. It is found to be true, however, in artificial filtration that the effect of use is the clogging of the bed, and the diminution of the supply, rather than a decrease in efficiency. The tendency, therefore, is for a short path to clog most rapidly, and this, by a change in the character of the interstices, automatically reduce the rate so that it is probable that the infiltration from stream beds which reaches the well upon the bank is much more uniform over the area of the stream bottom than would be ordinarily supposed. The natural filter thus formed necessarily possesses the defect that the manner of its operations is in some doubt, and although the filtration rate is not uniform over the entire surface at any particular place, the filtration rate at any one place is possibly as uniform as that of our artificial filters. Owing to the distances traversed by such waters, the results of the process are doubtless less subject to quick change than any system of artificial filtration, and uniformity of results is an important matter in water purification.

Brooklyn Investigation.—The Burr-Hering-Freeman commission, for its report upon the water-supply of Greater New York, conducted an experiment upon the travel of pollution at Elmont, Long Island, at a laborers' camp where between 200 and 300 Italians were housed. The experiment consisted in construcing a cesspool, used by the entire camp, and noting the quality of ground water at varying distances therefrom. The cesspool was 11x2½ ft., and 6 ft. deep. The soil was sand, having an effective size of 0.26 mm. and a uniformity coefficient of 2.71. The original bacterial content of the soil at various depths was as follows: 615,000 per cc. at 4 ins. depth, 1,750 at 15 ins. and 800 at 27 ins., with zero at depths of 33 ins. to 72 ins. The tests for B. coli were negative at all depths.

The bottom of the cesspool was about 8 ft. above the ground-water plane. Test wells were sunk at a distance of 10 ft. from the side of the pit, drawing water respectively 2 ft., 7 ft. and 17 ft. below the ground-water line. About a week after the cesspool was placed in use, analysis from these test wells were begun, and continued for about a month, showing that the water from all of the test wells was highly polluted. The degree of pollution apparently varied considerably (as would be expected) with the rainfall. The total bacterial count varied from 10,000 to 400,000 per cc. In 60 observations at the various depths stated, the colon bacillus was found once in 0.1 cc., six times in 1 cc. and 17 times in 10 cc. A similar experiment upon an old cesspool, whose bottom was located about 2 ft. above the ground water plane, showed similar results.

Tests were also made on wells at distances of 50 to 300 ft. All these wells beyond 50 ft. showed absence of B. coli in 1 cc. and less, and all except the wells at 130 and 160 ft. showed B. coli absent in 10 cc. The nitrates were, however, very high, and indicated that the organic matter was actively undergoing decomposiaion. As a result of this investigation and others, the commission concluded:

With low velocities, polluted water passing though the finer sands that exist on Long Island, for a distance of 25 ft. may be considered as practically safe for use, and it is probable that in most cases a distance less than this would serve as an efficient safeguard.

German Experiment.—A recent experiment in connection with the water-supply of Berlin

*Abstract of a paper by C. B. Burdick, of Alvord & Burdick, Hydraulic and Sanitary Engineers, Hartford Bldg., Chicago, presented at the annual meeting of the Illinois Water Supply Association, at the University of Illinois, March 8, 9, 1910.

has been reported in the "Gesundheit-Ingenieur." The object was to ascertain how near a well a broken sewer pipe would contaminate the supply. The experiments were made by supplying water inoculated with B. prodigiosus to the soil at a certain distance from a well at which water was drawn at a constant rate. Tests were made by delivering the inoculated water to the soil both below and above the ground water line. The water-bearing material was sand and gravel of average coarseness.

In the first experiment the well tested was 177 ft. deep, the top of the strainer 121 ft. deep, and water was drawn from the well continuously for 30 days at the rate of 380,000 gals. per day. The inoculated water was introduced 69 ft. horizontally from the well through a special well point, the inoculated water therein being kept at a constant level of from 3 to 4½ ft. above the ground-water level, requiring about 1,000 gals. of inoculated water per hour. Tests of the well water were made with extreme care, and the test bacillus was first detected in the well water nine days after the test started and at several times thereafter. As the result of the test it was concluded that 1 in 40,000 of the bacilli reached the well, and inasmuch as dangerous bacteria are more sensitive to cold water, they would be less likely to survive under the circumstances than the bacillus used in the test.

The second experiment was made upon a well 140 ft. deep, the top of the strainer being 92 ft. below the ground surface and 76 ft. below the ground-water level, which was 16 ft. below the ground surface. The inoculated water was introduced 58 ft. from the well and 4 ft. above the ground water level. The test occupied a period of 1½ months. Water was drawn from the test well at the rate of 85,000 gals. per 24 hours. In this test no trace of bacteria was found in the well, although 8,240,000 millions of the bacillus were poured into the germ pipe.

It will perhaps be of some use to the cause of sanitation to set down some facts noted by the writer in the investigation of two public water-supplies that have recently come under his observation in the course of professional practice.

Winona, Minn.—The situation at Winona, Minn., is interesting from a sanitary standpoint, in that for many years the municipal supply has been drawn from a system of wells immediately adjoining the business center of the city. At Winona the ancient Mississippi River excavated a channel in the native rocks three miles wide and more than 500 ft. deep, and, with the gradual recession of the water, refilled its channel to a depth of 200 ft., mostly with coarse sand and gravel.

The city occupies one of the huge sandbars left by the receding river, with the present Mississippi on its front, and a lagoon paralleling the river close to the rocky cliffs on its rear. The water-works plant is located on the river front at the end of one of the principal business streets, and immediately adjoining the business center. At the present time the city has a population of 21,000, and is consuming water at the average rate of 1,750,000 gals. per day, with a maximum rate of 3,000,000 gals. The hourly pumpage rate during sprinkling hours frequently reaches a 7,000,000-gal rate, no storage being provided, either elevated or otherwise.

The supply is drawn from two circular masonry wells about 50 ft. diameter, the well shoes being from 11 to 18 ft. below datum, or low water. The ground surface stands at 18 ft. above datum. The north well is about 25 ft. and the west well 175 ft. from the edge of the river. There are numerous sources of pollution, vaults, etc., within 200 ft. of the wells. A private sewer passes through the grounds about 150 ft. distant. The sewage of the city is discharged several blocks below the pumping station. The ordinary draft or depression of the ground-water level in the wells is about 5 ft., although the pumps are capable of reducing it about 15 ft. The static water level when the wells are shut down corresponds closely with the stage of the river, which ordinarily varies 10 or 15 ft. during the year. The underlying material is principally coarse sand to a depth of 175 ft. below the ground surface, having an effective size of from 0.35 to 0.45 m.m., and a uniformity coefficient of about 3.5. The supply under the well shoes is supplemented to a slight extent by numerous drive-well points in the bottoms of the open wells to a total depth of 60 or 70 ft. below the ground surface. The supply from these points is said to be inconsiderable owing to the corroded condition of the strainers. A small amount of water leaches through the masonry of the wells, but the major portion of it comes under the well shoes. In regard to the character of this water, the Minnesota State Board of Health concluded:

No wells could be recommended which receive surface water in relatively thickly-settled portions of the town, and situated as close to a badly polluted water as that of the Mississippi River water at Winona. . . . These dug wells cannot be endorsed by any sanitary authority, not that they have constituted a source of danger as evidenced by typhoid and digestive disturbances, but that they may, if excreta from patients should find its way into the wells.

The total bacterial count in the water is extremely low, running from 3 to 50 per c.c. It is noteworthy, however, that B. coli were found present in four out of ten observations in 1 c.c. Upon the whole, however, it is surprising that water as favorable in character is obtained under circumstances apparently so detrimental to the sanitary supply. The typhoid death rate per 100,000 in 15 years has never exceeded 40, has exceeded 30 only twice, has exceeded 20 eight times, and has been less than 10, eight times, or over 50 per cent of the time.

Manistee, Mich.—The situation is in many respects similar to that of Winona. The water-supply is derived from the sands and gravels of the ancient Manistee River terrace. The ancient river cut through a bank of clay to a depth of about 200 ft., and a width of about 1½ miles, afterwards refilling its channel with the sands and gravels from which the present supply is derived. This material below the ground-water plane is fairly homogeneous. The sand has an effective size of about 0.35 m.m., and a uniformity coefficient of from 2 to 2.5.

As at Winona, the water-works plant closely adjoins the inhabited part of the city; in fact, occupies the ground that was first settled. The business part of the city, however, is at some distance from the plant. There are a number of vaults at present in use, 250 to 500 ft. distant from the wells forming the source of supply. A 9-in. pipe sewer at a depth of 10 ft. passes within 29 ft. of well No. 3, and a similar sewer 6 ft. deep within 37 ft. of well No. 4.

The site of the water-works is 25 ft. above river and lake level. The ground-water plane in a state of rest is about 2 ft. above the same plane of reference, and, when the wells are pumped, is drawn down at the rate of about 1 ft. for each 250,000 gals. of pumpage.

The present population is about 14,000. The average daily consumption for the past year has been 951,000 gals. The maximum 24-hour consumption is 1,500,000 gals. and the maximum rate during the sprinkling hours of a hot summer day, between 6 and 8 p. m., is from 3,000,000 to 4,000,000 gals.

The supply is derived from four masonry-curbed wells, from 30 to 45 ft. diameter, and 34 to 44 ft. in depth below the ground surface. The supply is largely supplemented by three 8-in. pipe wells, driven one each in the bottom of the three principal open wells. These pipe wells penetrate an additional depth of 60 ft., and are packed in an ingenious manner with gravel. They have no strainers, the water being admitted through perforations in the pipes. The supply is therefore drawn at two places: (1) Under the well shoes from 8 to 20 ft. below the ground-water plane, and (2) from the pipe wells 40 to 60 ft. deeper.

The total bacterial count was usually less than 50, but it varied from day to day, occasionally exceeding 500 c.c. In about 140 observations the presumptive test for the B. coli was negative in all tests on 0.1 c.c.; in 1 c.c. it was positive once, and in 10 c.c. 13 times. In a 10-year record the typhoid death rate has exceeded 40 (per 100,000) once, 30 once, 20 three times, 10 six times, and has been less than 10 four times, or 40 per cent of the time. The average death rate is less than 15.

In the light of all these data, it cannot be successfully maintained that the character of the water-supply has had a detrimental effect in the matter of local typhoid. In view, however, of the environment of the wells, the possibilities for contamination, and the occasional evidences of sewage pollution during the period of the examination, it was concluded that the water was not safe for continued use without treatment.

Discussion of Data.—The writer must confess some surprise that the continued public use of water from such sources as these has apparently done so little harm, and the explanation is doubtless to be found in the fact that the bacilli of disease are apparently eliminated by processes less effective upon other forms of bacterial life, sufficiently easy of recognition to be useful in practical water examinations.

There is an important work for our university experiment stations in the study of this subject, and in the endeavor to formulate methods of investigation more certain than we have at present in the separation of the bad from the good. The sanitary determinations often govern considerable expenditures, and while the wise analyst will always condemn in case of doubt, it is very important that the realm of doubt be confined to limits as narrow as possible, for to unjustly condemn tends to the detriment of sanitation generally.

Shade Trees.—The following regarding the furnishing and planting of shade trees in connection with the construction of state highways, is taken from the specifications of the State Highway Department of Connecticut: The contractor will be obliged to furnish and plant where indicated ....., or as near as it is practicable ..... shade trees, the preference being given to hard maple trees in the selection, no swamp trees allowed. The calibre of these trees 1 ft. from the crown of the root shall be 2 in. in diameter. Good straight trees shall be selected with natural tops, neatly trimmed, not too much, care being taken to properly shape the tree, no bean poles will do. In taking up the trees care shall be used by the contractor to see that the roots are not defaced or cut off, so as to injure the trees, preserving the fibrous roots as far as possible. No trees shall be planted in less dimensions of home for the tree than 4 ft. in width and 3 ft. in depth. Good loam or soil suitable for planting said trees shall be used. All sand and rock and material that would be injurious to the growth of the tree shall be removed, and only good, dark, rich soil used in making a home for the roots of the trees to rest. Care shall be taken in planting the tree to properly spread the roots and place them as near as possible in their natural position. The earth shall be tamped in good and solid and the tree well shaken as the earth is being put around the roots, to properly bed them. A sufficient amount of water shall be added so that the tree may have an opportunity to receive all of the nourishment necessary to assist its growth. Two or more stakes shall be furnished and the tree properly tied so as to prevent any possibility of the roots being disturbed. If, when the road has been completed, it is not the proper season for planting trees, the contractor shall leave on deposit with the town the sum of $10 per tree, and if he neglects to plant them the following season, the commissioner is hereby given the right to plant whatever trees are required without further notice, and pay for the same out of any money that may be due the contractor. Whatever the season of the year in which the tree is planted it shall be protected by a 6-in. mulch of hay or grass extending 2 ft. in all directions from the tree trunk.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Cost of Constructing and Operating the Electric Street Railways of Long Island City—The New York and Queens County Railway.

All the street railways of Long Island City and vicinity are owned by the New York & Queens County Ry. Co. This company was incorporated in 1896 and absorbed the various street railways of Long Island City. Most of its stock is now owned by the Interborough Rapid Transit Co.

The following data relate to the fiscal year ending June 30, 1908. The track mileage was as follows:

	Miles.
Road, main track	40.24
Second track	28.96
Total track operated	69.20
Siding, storage track, etc.	5.27
Total, all tracks	74.47

The lines are all surface railways, electrically operated by the overhead trolley system.

The rolling stock was as follows on June 30, 1908:

101 closed motor cars.
15 closed non-motor cars.
118 open motor cars.
40 semi-convertible motor cars.
1 parlor car.

275 passenger cars.
7 snow plows (motor).
4 sweepers (motor).
15 work cars (9 being motor cars).
1 wrecking car (motor).
5 other service cars (motor).

The cost of this passenger car equipment was as follows:

41 closed motor cars, 15 tons, 27 ft. long, at $5,000.
36 closed cars (15 non-motor), 7 tons, 18 ft., at $800.
100 open motor cars, 7 tons, 31 ft., at $2,000.
30 semi-convertible motor cars, 19 tons, 31 ft., $6,000.
50 closed motor cars (steel), $13,257.

275 total.

These 275 cars cost $1,228,753, or $4,440 per car. The 50 steel cars were purchased during the year 1908.

The average age of the rails was 12½ years; of tires, 4 years.

The ballast was sand for 35 miles, and cinders and stone for 4 miles.

The rails whose sizes were reported were:

	Miles.
6-in. girder	14.00
7-in. girder	8.56
9-in. girder	20.94
9-in. trilby	2.83
[illegible]	1.29
[illegible]	5.94
Total	53.56

The company had laid 195,620 sq. yds. of paving, nearly all of which was bluestone and granite blocks.

The electric line construction consisted of 38.40 miles of overhead trolley span wire, and 1.84 miles side bracket. There were 40.24 miles of iron poles, 42 to the mile. There were 50.33 miles of vitrified ducts, occupying 3.39 miles of street.

There were two timber trestles, with total length of 5,808 ft.; no other bridges.

The power plant had 5 generators with a total rated capacity of 2,100 kw. This plant was inadequate, and was withdrawn from service April 28, 1908, so it was in operation only eight months of the year.

There were two substations whose equipment was:

[illegible] kw.
[illegible] kw.
60 storage battery cells..... 80 amp. hrs.
1 motor generator set..... 100 kw.

The reported cost of the road and its equipment was:

1. Right of way	$ 27,748
2. Real estate used in operation	53,587
3. Track and roadway construction	972,021
4. Electric line construction	566,071
5. Buildings and fixtures used in operation	387,720
6. Power plant equipment	345,428
7. Shop tools and machinery	19,873
8. Cars and electric equip. of cars	1,228,753
9. Miscellaneous equipment	3,287
10. Organization	10,667
11. Miscellaneous	10,865
Total	$3,626,020
12. Purchase of constructed roads	4,696,563
Grand total	$8,322,583

Dividing each of these 12 items by 69.2, the miles of operated trackway, we have the following cost per mile of trackway (not of track):

	Per mile.
1. Right of way	$ 402
2. Real estate	774
3. Track and roadway	14,046
4. Electric line construction	8,180
5. Buildings	5,604
6. Power plant equipment	4,991
7. Shop tools and machinery	287
8. Cars and electric equipment of cars	17,757
9. Miscellaneous equipment	48
10. Organization	154
11. Miscellaneous	157
Total	$ 52,400
12. Purchase of constructed roads	66,280
Grand total	$118,680

It needs little engineering knowledge to perceive that Item 12 represents very little but promoter's profits.

Since there were 1.076 miles of track per mile of trackway, divide each of the above items by 1.076 to get the cost per mile of track.

The power plant equipment (Item 6) cost $165 per kw. of generator capacity, but it should be remembered that the substation equipment not only provided for the 2,100 kw. station generators but for a large amount of purchased power.

The traffic statistics were as follows:

Mean number of passenger cars in use	251
Passenger car miles	1,533,172
Same per mile of all track	60,872
Same per passenger car in use	18,060
Same per passenger	0.243
Freight, mail and express car miles	None
Service car miles	No record
Passenger car hours	507,295
Passenger car miles per hr. (speed)	8.94
Car trips	397,626
Car miles per trip	11.40
Passengers, at 5 cts.	18,631,339
Passengers in chartered cars	33,760
Passengers per car mile	4.12

The employes and wages were as follows:

General Office Staff:	
1 general officer	
2 other officers	$18,000
40 employes	29,920
43 total general office	$ 47,920
Transportation:	
22 inspectors.	
3 train clerks and dispatchers.	
1 superintendent.	
156 conductors.	
161 motormen.	
2 drivers (horse car).	
4 switchmen and yardmen.	
124 road and trackmen.	
5 hostlers, stablemen, etc.	
480 total transportation	$298,543
Power (largely purchased):	
1 engineer.	
7 boiler cleaners.	
1 electrician.	
30 linemen.	
39 total power	$ [illegible]
Car Houses and Shops:	
24 car cleaners.	
2 car oilers.	
3 lamp trimmers.	
26 car house repairers.	
9 other car house men	
16 carpenters	
12 blacksmiths.	
2 machinists.	
2 brass moulders.	
3 armature winders.	
2 electrical helpers.	
6 painters.	
5 other men.	
111 total car house and shops	$ 75,461
673 grand total	467,547

Conductors and motormen received 20 cts. per hr. for the first and second years, 21 cts. for 3d year, and 22 cts. after 5th year.

The cost of operation was as follows:

Maintenance of Way and Structures:	
1. Track and roadway	$ 45,037
2. Electric line	13,999
3. Buildings and fixtures	1,720
Total maintenance of way	$ 60,756
Maintenance of Equipment:	
4. Steam plant	$ 7,334
5. Electric plant	438
6. Cars	36,981
7. Electric equip. of cars	31,896
8. Miscellaneous equipment	831
9. Shop expenses	4,253
Total maintenance of equipment	$ 81,733
Operation of Power Plant:	
10. Wages	$ 16,456
11. Fuel	32,432
12. Water	2,690
13. Lubricants and waste	1,114
14. Miscellaneous supplies and expenses	6,137
15. Hired power	86,911
Total operation of power plant	$165,740
Operation of Cars:	
16. Superintendence of transportation	$ 1,556
17. Wages of conductors	108,473
18. Wages of motormen	110,009
19. Wages of miscel, car service men	15,927
20. Wages of car house men	2,753
21. Car service supplies	7,380
22. Miscellaneous car service expense	19,604
23. Cleaning and sanding track	4,080
24. Removal of snow and ice	3,975
Total operation of cars	$273,757
General expenses:	
25. Salaries of general officers	$ 10,164
26. Salaries of clerks	8,717
27. Printing and stationery	3,600
28. Miscellaneous office expense	2,982
29. Stores expenses	1,716
30. Stable expenses	4,467
31. Advertising and attractions	75
32. Miscellaneous general expense	6,467
33. Damages	131,640
34. Legal expense incident to damages	32,413
35. Miscellaneous legal expenses	12,651
36. Rent of land and buildings	301
37. Rent of track and terminals	544
38. Insurance	12,089
Total general expense	$227,828
Grand total operating expense	809,815
Taxes assessed for the year	50,492

The cost of operation was as follows per car mile:

	Cents per car mile.
Maintenance of Way and Structures:	
1. Track and roadway	0.994
2. Electric line	0.308
3. Buildings and fixtures	0.038
Total maintenance of way	1.340
Maintenance of Equipment:	
4. Steam plant	0.161
5. Electric plant	0.010
6. Cars	0.817
7. Electric equipment of cars	0.703
8. Miscellaneous equipment	0.018
9. Shop expense	0.094
Total maintenance of equipment	1.803
Operation of Power Plant:	
10. Wages	0.363
11. Fuel	1.157
12. Water	0.059
13. Lubricants and waste	0.024
14. Miscellaneous supplies and expense	0.136
15. Hired power	1.917
Total operation of power plant	3.656
Operation of Cars:	
16. Superintendence of transportation	0.034
17. Wages of conductors	2.393
18. Wages of motormen	2.427
19. Wages of miscellaneous car service men	0.351
20. Wages of car house men	0.061
21. Car service supplies	0.163
22. Miscellaneous car service expense	0.432
23. Cleaning and sanding track	0.090
24. Removal of snow and ice	0.088
Total operation of cars	6.039
General expense:	
25. Salaries of general officers	0.223
26. Salaries of clerks	0.192
27. Printing and stationery	0.079
28. Miscellaneous office expense	0.066
29. Stores expenses	0.037
30. Stable expenses	0.098
31. Advertising and attractions	0.002
32. Miscellaneous general expense	0.142
33. Damages	2.906
34. Legal expense incident to damages	0.717
35. Miscellaneous legal expense	0.279
36. Rent of land and buildings	0.007
37. Rent of electric subway	0.012
38. Insurance	0.266
Total general expense	5.026
Grand total	17.864
Taxes assessed for the year	1.110

The maintenance of track and roadway (Item 1) cost $650 per mile of trackway

(69.2 miles), as compared with $688 for the preceding year.

The maintenance of electric line (Item 2) cost $203 per mile of trackway, as compared with $263 for the preceding year.

The maintenance of power plant cost as follows for the fiscal years 1907 and 1908:

Year.	Per kw. 1907.	1908.
Steam plant (item 4)	$5.95	$3.50
Electric plant (item 5)	0.64	0.20
Total	$6.59	$3.70

It must be remembered that the generating power plant was abandoned after 10 mos.' use in 1908.

In determining the cost of maintenance of passenger cars, we shall not consider the 50 new steel cars purchased during 1908; but shall assume that all the maintenance costs were due to the 225 old cars whose total first cost was $566,000, or $2,510 per car. The maintenance of these cars (Items 6 and 7) was as follows for the fiscal years of 1907 and 1908 per car:

Year.	Per car. 1907.	1908.
Maintenance of car (body and truck)	$181	$164
Maintenance of electric equipment	235	141
Total	$416	$305

About $360 is the average for these two years, so that the annual maintenance expense was 14 per cent of the first cost of the cars; nor does this include shop expense (Item 9) which should evidently be prorated among Items 4 to 8.

In considering the cost of street car maintenance, sight should not be lost of the fact that the open cars are used only during the summer months, and that during such periods few of the closed cars are used. Hence if half the passenger cars were constantly idle, the wear and tear on the total car equipment would be about half what would occur if all cars were constantly in use. This company reports 250 cars in constant use, but we doubt the accuracy of the statement, for 40 per cent of the total equipment of 275 cars consisted of open cars. Moreover, there were only 160 motormen employed, and the number of motormen is never less than the number of cars in active use; often the number of motormen is 40 per cent in excess of the number of cars in active use.

The cost of operating the power plant (Items 10 to 14) was $78,829 for 10 months, during which it produced 9,356,128 kw. hrs., or 0.84 ct. per kw. hr. Since the plant had 2,100 kw. capacity, each kw. generated 4,455 kw. hrs. Since there are 8,760 hrs. in a year, the load factor was 4,455÷8,760= 51 per cent. It required 4.71 lbs. of anthracite (at $2.38 per ton of 2,000 lbs.) per kw. hr., which indicates a poor quality of fuel. There were purchased 6,614,322 kw. hrs., at 1.3 cts. per kw. hr. The total energy was, therefore, 15,970,500 kw. hrs., which is equivalent to 3.52 kw. hrs. per passenger car mile.

The cost of accidents (Items 33 and 34) was exceptionally high, being 3.6 cts. per car mile, or nearly 20 per cent of the total operating expense. During the same year the total cost of accidents on surface railways in New York city was about 10 per cent of the total operating expense. On all the street railways in Massachusetts, during the same year, damages amounted to 1.04 cts. per car mile, and all legal expense amounted to 0.36 cts. per car mile, a total of 1.40 cts. The legal expense also included other legal expenses than those arising from damages. This 1.40 cts. is 8 per cent of the total operating expense of 17.56 cts. per car mile (See page 1,450 of the second edition of Gillette's "Handbook of Cost Data").

The operating income was:

Passengers	$935,000
Advertising	2,500
Rents	300
Total	$937,800

For study in connection with the above statistics readers may advantageously consult the costs of operating the New York subway lines given in our issue of April 6, 1910, and the costs of operating the Manhattan Elevated lines, given in our issue of April 20, 1910.

Cost of Generating Electric Power for Operating the Elevated and Subway Cars in Manhattan New York City.

In our issue of April 13 the first cost and cost of operating the New York subway were given. In our issue of April 20 the cost of operating the Manhattan Elevated was given, also the first cost of the equipment.

The Interborough Rapid Transit Co. operates both the subway and the Manhattan elevated, and generates some four hundred million kilowatt hours of electricity annually. The following data as to the cost of producing this power have been deduced from their annual report for 1908. There are two power plants, and the following is their total equipment and rated capacity:

Station Equipment:	
Boilers, 130 units	72,880 HP.
Superheaters, 12 units	9,744 HP.
Economizers, 36 units	261,040 HP.
Steam engines, 17 units	131,500 HP.
Turbo-generators, 4 units	10,250 KW.
Generators (direct A. C.), 17 units.	85,000 KW.
Station transformers, 12 units	2,625 KW.
Storage battery cells, 240 units	2,000 amp. hrs.
Rotaries, 3 units	2,400 KW.
Exciters, 9 units	2,250 KW.
Substation Equipment:	
Rotary converters, 84 units	126,000 KW.
Transformers, 252 units	138,600 KW.
Miscellaneous, 39 units	2,109 KW.

The cost of maintaining and operating this plant and the electric transmission lines was as follows for the year ending June 30, 1908:

Maintenance:	
1. Electric line	$ 148,104
2. Buildings and fixtures	192,071
3. Steam plant	291,645
4. Electric plant	53,983
5. Shop expense (prorated)	78,000
6. Undistributed expense (prorated)	16,000
Total maintenance	$ 689,804
Operation of Power Plant:	
7. Wages	$ 420,173
8. Fuel, 479,435 short tons (soft), at $2.95	1,413,907
9. Water	120,781
10. Lubricants and waste	35,278
11. Miscel. supplies and expenses	81,811
12. Undistributed expenses	86,560
Total operation of power plant	$2,167,510
Grand total	2,857,314

There were 402,084,635 kw. hrs. produced, of which all was used to operate the subway and elevated railways except 10,181,000 kw. hrs. which were sold. The selling price ranged from 1¼ to 2½ cts. per kw. hr., depending on the amount consumed.

Item 5, "Shop Expense," and Item 6, "Undistributed Expense," are charged to maintenance of rolling stock as well as power plant, so we have roughly prorated these items to the power plant maintenance, although it is by no means certain exactly how they should be charged.

Item 2, "Buildings and Fixtures," probably includes a considerable sum spent on buildings other than power plant buildings, and this should be borne in mind when considering the following unit costs:

Maintenance:	Cents per kw. hr.
1. Electric line	0.037
2. Buildings and fixtures	0.048
3. Steam plant	0.050
4. Electric plant	0.013
5. Shop expense	0.019
6. Undistributed expense	0.004
Total maintenance	0.171
Operation of Power Plant:	
7. Wages	0.105
8. Fuel, 2,835 lbs. at $2.95 per ton	0.353
9. Water	0.032
10. Lubricants and waste	0.009
11. Miscel. supplies and expenses	0.020
12. Undistributed expense	0.021
Total operation of power plant	0.540
Total maintenance and operation.	0.711
13. General expense (5½%)	0.039
Grand total	0.750

Although the item of "General Expense" amounted to 10.7 per cent of the total operating expenses of the Interborough Rapid Transit Co., nearly half this general expense was due to damages and legal expenses. Eliminating these, the general expense would not amount to more than 5½ per cent, so we have estimated Item 13 on that basis.

In our issue of April 13 it was shown that the cost of the power plant (55,000 kw.) and transmission line of the subway is reported to have cost as follows:

	Per kw.
Electric transmission lines	$ 83
Buildings and fixtures	35
Power plant equipment	112
Real estate	25
Total	$255

This is a high unit cost for the transmission lines and the buildings. Since the 95,000 kw. plant (subway and elevated) produced 402,084,000 kw. hrs., each kw. produced 4,243 kw. hrs. during the year. Since there are 8,700 hrs. in a year, the plant operated under an average load factor of 4,243÷8,760=48½ per cent.

Assuming, for illustration, that the first cost of each kw. of plant was $300, and that interest was 6 per cent, we should have $18 interest. This divided by 4,243 kw. hrs. gives 0.42 ct. per kw. hr. to be charged to interest on investment, which, added to the 0.75 ct. maintenance and plant operation, gives a grand total of 1.17 ct. per kw. hr. The maintenance of plant and transmission line (Items 1 to 6) cost 0.17 ct. per kw. hr., which is equivalent to only 2½ per cent on a plant whose first cost is $300 per kw.

If we consider only the power plant equipment ($112 per kw.), the maintenance (Items 3 to 6) was 0.086 ct. per kw. hr. Since each kw. produced 4,240 kw. hrs., this is equivalent to 4,240×0.086 ct. = $3.65 per kw. for power plant equipment maintenance. Since this is less than 3.3 per cent of $112, the first cost, it is evident that these maintenance costs are far below what they will be a few years hence, when the plant is older. The elevated railway power plant was put in operation in 1904, and the subway in 1905.

There were 2,385 lb. of bituminous coal used per kw. hr., and the price was $2.95 per ton of 2,000 lbs.

For comparison of unit costs of generating electricity, the reader is referred to the costs of the Edison Electric Illuminating Co. of Brooklyn, in our issue of April 6.

The Interborough Rapid Transit Co. had the following number of employes operating both the subway and the elevated during the year ending June 30, 1908:

General Office Staff:	
467 employes general office staff	$657,923
Transportation:	
106 Train clerks and dispatchers.	
21 Starters.	
11 Depot masters.	
686 Ticket agents.	
740 Gatemen and platform men.	
2,173 Guards.	
530 Conductors.	
595 Motormen.	
358 Switchmen, flagmen and yardmen.	
1,198 Road and track men.	
302 Station porters and watchmen.	
2 Other employes.	
6,722 Total transportation	$4,517,304
Power:	
32 Engineers.	
104 Oilers.	
19 Wipers.	
122 Firemen (stoker operators).	
22 Coal passers.	
30 Water tenders.	
25 Ashmen.	
32 Boiler cleaners.	
89 Dynamo and switchboard men.	
30 Electricians.	
23 Linemen.	
246 Other power plant employes.	
722 Total power	$578,493
Car Houses and Shops:	
189 Car cleaners.	
22 Lamp trimmers.	
169 Car house men.	
48 Other car house employes.	
210 Carpenters.	
38 Blacksmiths.	
94 Machinists.	
114 Machinists' helpers.	
3 Brass moulders.	
208 Electrical helpers.	
155 Painters.	
310 Other shop employes.	
1,560 Total car house and shops	$ 77,900
9,521 Grand total	6,610,722

This is equivalent to an average of $13.40 per employe per week.

The total car mileage was:

Rapid Transit Subway	44,005,213
Manhattan Ry. Co. (Elevated)	64,584,609
Total, Interborough Rapid Tr. Co.	108,589,822

Since 391,900,000 kw. hrs. were generated for 108,589,822 car miles, it required 3.6 kw. hrs. per car mile, at an average speed of 16.08 miles per hr. (including stops). There were 4.45 passengers per car mile, or 71.57 passengers per car hour.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Some Conditions, Methods and Costs of Construction Work, In Peru, South America.

In the past ten years numbers of engineers and contractors have gone to South America with the purpose of locating there in business or to look after construction work in different capacities representing American firms. The writer has had two years residence in Peru,

Fig. 1—View of Plant of the Peruvian Mining, Smelting & Refining Co., Showing Mountainous Country.

and has picked up various items of interest at first hand as an engineer (during construction) of a copper smelter, which was built in the Andes at an elevation of 11,500 ft. above sea level. He has found many engineers and contractors curious to know the conditions met with and the ideas of some of them are so entirely wrong and their knowledge of the country is so limited that it is worth while telling of a few things which will help anyone who may contemplate going there.

Peru is on the western coast of the continent and extends along the Pacific for a distance of 1,500 miles. The country is from 200 to 1,500 miles wide, east and west, and although Peru claims the right of domain over many hundreds of thousands of square miles of land east of the Andes mountains, and in the valleys of branches of the Amazon, yet the greater part of this land has never been explored. This land is inhabited by different tribes, some of which are cannibals, who know nothing about Peru's claim to the land on which they live. The territory over which stable government is actually in force is a strip along the coast about 200 miles wide extending from Equador to Chili. The main seaport, Callao, is 7 miles from Lima, the capitol, and is 1,500 miles south of Panama. The flat strip of land along the coast is only a few miles wide, 25 to 50 miles, and the balance of the inhabited country is very mountainous. The chief resources of the country are in mining, though the sugar and coffee plantations have been, in the past, the foremost resources.

Peru has had her wars and revolutions as well as other South American republics, but has for some time been on a sound money basis and much American capital is invested there. The attitude of the government and people is quite friendly to Americans, more so, perhaps, than that of any other South American country, unless it be Argentina. The conditions and quality of labor will vary in different localities, and especially in different South American countries, but wherever Spanish is the language of the country, the customs of the people are also apt to be Spanish. The condition of the labor will generally vary according to the stability of the respective governments. Skilled labor is not plentiful nor is it to be classed with skilled labor in United States. In Peru a man may choose his trade to suit the opportunity—he may be a bricklayer today and a carpenter tomorrow, and as a result the skilled labor consists of "jacks of all trades—and masters of none." The average rate of wages paid for carpenters, masons and mechanics is from $2 to $3 per day, according to the man. The common labor, especially in the mountains, consists of the original Indian inhabitants of Peru whose blood has mixed with Spanish blood for some 400 years. These people have an appearance much like that of the original Indian inhabitants of our northwestern states. The excessive use of cocaine by these Indians, who chew the coca leaves, and their drink, pisco, which is nearly pure alcohol,—has made them shiftless and without the necessary strength of body or mind to be worth much at common labor. Even at the rate of wages paid them, which averages from 30 cts. to $1.20 per 9-hour day, the labor item is more expensive than labor in this country at twice the wage.

Local conditions always effect costs of construction to a certain extent but it is not usual that every local condition will raise costs. However, in the rugged country of the Andes, at 11,500 ft. above the sea, with atmospheric pressure only 9 lbs. per sq. in., and labor conditions as described above, it will be seen that local conditions control costs in every respect.

Most of the building material for the smelter above referred to was shipped from New York around the Horn to Callao and after passing that port, came by railroad direct to the site. Transportation of freight from New York took 6 months on the average, although mail came from the States by way of Panama in from 19 to 26 days. It may be noted here that freight and mail will both go by way of the Panama canal, when it is completed, which will greatly reduce the time required.

The site of the construction was in a narrow valley with steep slopes, as shown by Fig. 1. The costs given here were obtained during construction on jobs in connection with the plant. One large retaining wall about 20 ft. high, 11½ ft. wide at the base and 3 ft. at the top was representative of the costs of rubble masonry during the construction of the plant. The wall was 350 ft. long and is shown by Fig. 2 in cross-section. The wall may seem to be of a larger cross section than necessary for a retaining wall, but in its design, consideration was taken of the quality of the labor building it and it was made heavy on that account more than for any other reason. The labor of laying the stone in the wall was let by contract at $1.26 (U. S. currency), per cu. yd. All material was furnished by the company and placed conveniently on the site for the contractor. The rock was quarried at different points near the site of the work and hauled in ½ cu. yd. cars on narrow gauge tracks. The lime was made by the company at kilns two miles below the plant and brought to the work on the backs of llamas, in bags of 100 lbs. each. This transportation was let by contract at 7 cts. per 100 lbs. The cost of lime was found to be very high, as shown by this item in the cost of the wall. This was due to the fact that no costs on burning lime had been figured up to this time and as the kilns were some distance away no special attention had been paid to them. It was discovered that the company's coal and tools were being stolen by the laborers. After a responsible

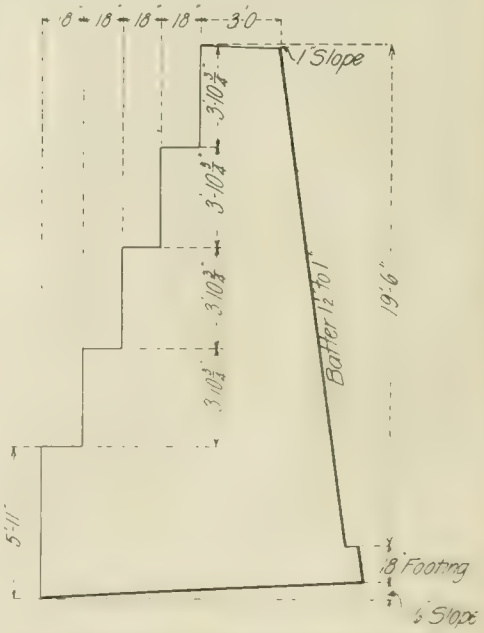


Fig. 2—Section of Rubble Masonry Retaining Wall.

man was put in charge, the cost of lime was reduced about one half.

The sand for mortar and for concrete also had to be brought by llamas a distance of 3½ miles. This work was let by contract at 6 to 9 cts. for 100 lbs., the price varying at different seasons of the year according to the general demands for llamas. These animals carried 100 lbs. and knew perfectly when more was added. If the weight was increased they would be quite likely to refuse to carry it, and they are so stubborn at such times as to take any amount of punishment

rather than give in. They are faster than burros and are handled in trains of about 30 or 40 animals. The value of one llama is not over $5. The llamas work two weeks and lay off one, because they cannot stand steady work and become very balky if worked steadily. An excellent photograph of one of the llamas carrying a bag of sand is shown by Fig. 3.

Fig. 3—Llama Loaded With 100-lb. Sack of Sand; Method of Transporting Sand for Mortar and Concrete.

The cement was shipped from New York around The Horn to Callao and from there by rail to the plant. The cost of the cement—Atlas cement was used—including freight, was $5.82 per bbl.

The following estimate for the cost of the wall is transferred into U. S. currency using 48½ cts. as the U. S. equivalent for one Peruvian sole:

Time—May, 1907—Dry Season
9 hour day.

Quarry Supplies.	
13 sticks dynamite per day at $0.004	$0.520
18 caps per day at $0.007	0.130
8/11 roll of fuse per day at $0.14	0.102
20 lbs. coal for forge per day at $18.43	0.184
4.65 lbs. drill steel per day at $0.11	0.511
Cost of quarry supplies per day	$1.447
Or for 26.16 cu. yds. rock produced per day, $0.055, per cu. yd.	
Labor for Quarry:	
34 men per day at $0.75, average	$25.50
3 foremen per day at $1.58⅓, average	4.75
1 mule per day at $0.75	.75
Total cost per day of quarry labor	$31.00
	Per cu. yd. rock.
Or for 26.16 cu. yds. rock per day	$1.19
Add quarry supplies	0.055
Total quarry cost per cu. yd.	$1.245
Cost of Mortar:	
	Per cu. yd. of wall.
Lime at $1.17 per 100 lbs., 62.2 lbs. per cu. yd.	$0.73
Cement at $5.82 per bbl., 16 bbls. per cu. yd.	.93
Sand at $0.07 per 100 lbs., 549 lbs. per cu. yd.	.38
Total cost of mortar per cu. yd. of wall.	$2.04
Contract price for laying per cu. yd.	1.26
Cost of rock	1.25
Total cost of wall per cu. yd.	$4.55

The cost of excavating 449 cu. yds. for the above wall was as follows: Material consisted of earth and boulders of small size. The work was done in 6½ days and ½ the material had to be handled twice, average haul 100 yds.:

23 men at $0.75 per day	$ 17.25
1 foreman at $1.50 per day	1.50
Total per day	$ 18.75
Total for 6½ days	121.88
449 cu. yds. cost $121.88.	
1 cu. yd. cost $0.271.	
Cost of masonry per cu. yd.	$4.55
Cost of excavation per cu. yd.	0.27
Total cost of wall and excav. per cu. yd.	$4.82

Note—Contractors cost for laying wall was $0.93 per cu. yd.

The proportions of mortar used in the above wall were 1 cement, 2 lime and 9 sand. The volume of mortar in this wall was 28 per cent of the volume of the wall. This is high for masonry walls and is attributed to the quality of the labor. A continuous attempt to reduce this percentage, resulted only in a moderate success after a year of hammering it into the heads of the mason foremen.

In making concrete we were fortunate in having plenty of stone within a short distance. The stone used was taken from the spoil bank of one of the railroad tunnels and was of various sizes. No stone, however, which larger than 4 ins. in greatest diameter, was used in mixing a batch of concrete, but larger stones were thrown in the wall forms with the concrete. The stone was brought to the site by ½ cu. yd. cars making a 100 yd. haul and the sand was brought by llamas at 6 cts. per 100 lbs. All sand weighed 95 lbs. per cu. ft. The concrete was hand mixed with labor averaging 75 cts. per 9-hour day and placed in forms for the power house wall foundations. These walls averaged 16 ins. in thickness and were 5 ft. in height.

Fig. 4—View of Dam and Upper Pipe Line Showing Rubble Masonry Supports.

Time—October, 1907—Dry Season.
Proportions concrete 1:3:5. Loose material calculated to be 1½ the volume of material in place.

111 cu. yds., cost for labor	$209.52
Cement, 4 cu. ft. to bbl.	
1¼ bbl. cement per cu. yd. concrete, at $5.82	$6.55
13.5 cu. ft. sand per cu. yd. concrete at ¾ cts. per 100 lbs.	0.77
22.5 cu. ft. stone per cu. yd. concrete, no cost, except that included in labor	...
40.5 cu. ft. loose material; total cost	$7.32
Cost per cu. yd. labor	1.89
Cost (excluding forms) per cu. yd. concrete.	$9.21

The labor on forms for this work cost about $1 per cu. yd. of concrete. The forms were used several times on other jobs.

It was found cheaper to manufacture our own brick than to pay the railroad freight. In wet seasons, however, it was impossible to dry the brick economically. The cost of making the brick was about $12 per thousand.

The contract price for riveting and placing a 40-in. power pipe line containing about 35,000 rivets of ⅝ in. diameter, was 4½ cts. a rivet. The accompying view (Fig. 4) shows a portion of this pipe line and also gives a good idea of some of the rubble masonry.

Some illustrations as to the difficulties encountered may be noted in conclusion. The railroad rates per M. ft. B. M. of lumber, shipped from the coast, 85 miles, raised the cost of the lumber $30. Other things were in proportion. Another annoying thing was the fact that some of the machinery, rope, etc., was held up in the customs until after the construction work was nearly completed. This was partly due to congestion at the port of Callao. This congestion can not be remedied until better facilities are provided for the increasing commerce of the country. The delays were due also to the well known slow business methods of Spanish countries.

Another little item of interest which comes to mind is a statement made by an American contractor in Lima. He said that he never made a bid for a public works contract without adding the amount of the cash bond furnished at the time of bidding, for the successful bidder never got his money back. This is, of course, a deplorable state of affairs, but it illustrates one of the many little things contractors are "up against" in South America.

Organization and Equipment of Survey Parties, Georgian Bay Ship Canal Survey, with Data on Allotment and Cost of Rations.

The surveys for the Georgian Bay Ship Canal, 440 miles, from Georgian Bay on Lake Huron to Montreal, were conducted by nine regular survey parties, one precise leveling party, three test boring parties, one hydraulic investigating party and one party for canal feeder surveys. The territory to be surveyed was divided into three districts, each in charge of a district engineer with headquarters at Ottawa. Each district was subdivided

TABLE I.—SHOWING QUANTITY AND COST OF RATIONS FOR 100 MEN FOR ONE DAY, GEORGIAN BAY SHIP CANAL SURVEY.

Articles	Quantity.	Cost.	Total Cost.
Fresh meat	100 lbs.	$0.12 per lb	$12.00
Cured meat	35 lbs.	0.17 per lb.	5.95
Canned meat	10 lbs.	0.14 per lb.	1.40
Cheese	5 lbs.	0.12½ per lb.	0.62½
Lard	15 lbs.	0.11 per lb.	1.65
Flour	75 lbs.	2.80 per cwt.	2.10
Crackers	5 lbs.	0.11 per lb. (average)	0.55
Corn meal	15 lbs.	0.04¾ per lb. (average)	0.72
Cereals	15 lbs.	0.04¾ per lb. (average)	0.72
Macaroni	15 lbs.	0.04¾ per lb. (average)	0.72
Sago or corn starch	15 lbs	0.04¾ per lb. (average)	0.72
Baking powder or yeast cakes	5 lbs.	0.05½ per lb.	0.27½
Granulated sugar	40 lbs.	0.04¾ per lb.	1.90
Molasses	1 gallon.	0.45 per gal.	0.45
Coffee	12 lbs.	0.30 per lb.	3.60
Tea, chocolate or cocoa	2 lbs.	0.35 per lb.	0.70
Condensed milk	10 cans.	0.13¾ per can.	1.37½
Butter	10 lbs.	0.20 per lb.	2.00
Dried fruit	20 lbs.	0.12⅔ per lb. (average)	2.53⅓
Rice	10 lbs.	0.05 per lb.	0.50
Beans	10 lbs.	0.03⅓ per lb.	0.33⅓
Potatoes or other vegetables	100 lbs.	0.50 per bush.	0.83⅓
Canned vegetables	20 cans.	1.15 per doz.	1.53⅓
Canned fruit	10 cans.	2.00 per doz.	1.66⅔
Spices	4 ozs.	0.03 per oz.	0.12
Flavoring extracts	4 ozs.	0.10 per oz.	0.40
Pepper	¼ lb.	0.28 per lb.	0.07
Mustard	¼ lb.	0.50 per lb.	0.12½
Pickles	6 bottles.	0.25 per bottle.	1.50
Vinegar	1 quart.	0.12½ per quart.	0.12½
Table salt	10½ lbs.	0.01⅓ per lb.	0.15
Total cost of rations for 100 men for 1			$45.18
Total cost of rations for 1 man 1 day			0.45 1-6

TABLE II.—SHOWING COST OF RATIONS FOR SURVEY PARTIES, GEORGIAN BAY SHIP CANAL SURVEY.

Name of Party.	Date of Field Work.	No. of Days.	Cost of Provisions.	Rate.
French River	May 13, '06-July 31, '06	1,352	$ 740.00	$0.54¾

into three or more sections, each in charge of a sectional engineer, who generally had under his control two assistant engineers, two rodmen, two chainmen, one foreman and seven or more laborers, according to the requirements of the work. The salaries paid were as follows:

Sectional engineers, per month	$200 to $225
First assistant engineers, per month	150 to 175
Second assistant engineers, per month	110 to 135
Rodmen, per month	75 to 90
Chain men, per month	60 to 75
Foreman, per day	2.00
Cooks, per day	2.00
Laborers, per day	1.50

While the length of canal surveyed was as stated 440 miles, the distance covered by surveys was some 600 miles by reason of the several branches of the Ottawa River which had to be developed and the several alternate routes that had to be inspected. As work had frequently to be performed on rough and dangerous waters, in order to reduce accidents the principle was adopted at the start of the work that all equipment should be new and the best available. It may be noted that there were only two drowning accidents during the work.

Equipment.—Each party was provided with 2 lumberman's boats 36 ft. long, 1 punt 24 ft. long, 1 skiff, 1 large Peterborough canoe, and 1 light canoe for portaging. On some sections where relatively large bodies of water existed it was found advantageous to have small gasoline launches; these saved much time when the work was several miles from the camping place. They were also used to transport supplies, to tow the smaller boats, etc. These launches were very strongly built, were 24 ft. long and 6 ft. beam and could carry 15 men.

The instruments supplied each party comprised 2 transits with stadia and other attachments, 1 Y level, 1 Dumpy level, 2 field glasses, 2 box sextants, 1 prismatic compass, 1 hand level, rods, chains, sounding wires, and all necessary articles of stationery.

The camp equipment generally consisted of 1 engineer's tent, 1 tent for rodmen and chainmen, 2 large tents for the men, 1 dining tent, 1 small tent for provisions and 1 small tent for the cook. All these were supplied with fly, tarpaulin, folding tables, stoves, etc. In many cases an extra tent was issued to be used as a drafting office. There was a full supply of camp beds, blankets, cooking utensils, etc.

The purchase and cost of provisions was realized from the outset to be an important item in connection with the survey and caution was exercised to control extravagance of any kind either in the matter of prices or in the purchase of fancy articles. A circular was issued giving quantities and prices for a ration for 100 men for one day, the amounts stated being maximum amounts and not to be exceeded. This ration list is shown by Table I. It was provided that articles of food not mentioned in the list, such as eggs, could be purchased instead of articles of a similar nature which were quoted. As will be seen from the list, the total cost of rations for 1 man for 1 day was 46 1/6 cts., and this cost was not exceeded, as is shown by Table II, giving the actual cost. In this table the differences in the averages were mainly due to transportation cost, when camps were a long distance from towns or villages.

Character and Methods of English Ordnance Surveys with Data on Costs.*

It is generally admitted that the art of surveying is practically a lost one in this country. This is undoubtedly due to the existence of the Ordnance Survey maps on various scales. It may be also said that very few people have any knowledge of what a survey should cost, and it is intended in this article to give data whereby the cost of any survey on any scale can be estimated. This will be of special interest to municipal surveyors who require to revise or extend their large scale plans. The necessity for the information is the greater owing to the Ordnance Survey having arbitrarily fixed upon the price of £45 per 1/500 plan, "revision or extension," which is a prohibitive price to local authorities who now have to pay for their large scale surveys if they require them.

A committee on the Ordnance Survey, appointed by Parliament in 1893, recommended that no scale work larger than the 1/2500 should be carried out at the expense of the National Exchequer, but that the Ordnance Survey Department might, at their convenience, revise or extend large scale areas on prepayment of the estimated cost of the same by local authorities. These maps, with certain reservations, become the property of the town which pays for them, and a certain amount may be recovered by the sale of the plans. The average sale of the plans of fourteen large towns in sixteen years was at the rate of 3s. per plan per annum (*vide* committee's report), so that it would take 300 years to recover the charge now made. The Ordnance Survey are now charged with the revision of all scale plans up to 1/2500 scale in a certain cycle of years, the period of town vicinities being less than that of country districts. A Parliamentary grant is made for the purpose, therefore in carrying out revisions or extensions at the cost of local authorities it seems only equitable that the charge should be based upon reduced rates to what an entirely new survey would cost, as these partial revisions or extensions aid the general revision. That this is not the case will be shown.

The cost of surveys depends on the difficulties encountered in the work. For instance, two plans may exist, each containing the same number of area parcels. On one plan all area boundaries are straight, ground level, and no obstruction to an uninterrupted view over the whole; on the other all boundaries are crooked, ground hilly, and view restricted by trees, etc. The latter might cost double the price of the former. It would be obviously unfair to class both alike, or according to area of parcels. It is therefore necessary in estimating the cost of surveys to classify according to the difficulties existing, and experience is needed to carry this out.

On the Ordnance Survey work is classed and priced at about the following rates for 1/500 work, and includes everything up to the completion of the manuscript plans in pence per acre. A 1/500 plan measures 1,584 ft. by 1,056 ft., and contains 38.4 acres:

Operation.	Very open. d.	Open. d.	Medium. d.	Close. d.	Very close. d.
Triangulation	2.5	3.5	5.0	7.5	10.0
Surveying	9.0	18.0	30.0	48.0	72.0
Plotting	2.0	4.0	9.0	14.0	21.0
Tracing for examination	0.75	1.5	2.0	3.0	5.0
Examination	9.0	18.0	30.0	48.0	72.0
Drawing	1.5	4.0	8.0	12.0	18.0
Coloring	0.5	2.0	5.0	8.0	11.0
Leveling	1.5	2.25	3.0	4.0	5.0
Tot. per acre	26.75	33.25	92.0	144.5	214.0
Total per plan	£4.2621	£8.5248	£14.7072	£23.1168	£34.2528

Cost of Revision Work.—It is obvious, if a town when surveyed was revised one year afterwards, that the cost of the revision would be very small in comparison with that of the original cost. If left many years a great deal of work on the plans, especially on outside areas of towns, would be obsolete, although generally the inside areas would not have altered much. To estimate the cost of revision work it becomes necessary to fix the average life of a survey—that is, to state a period when the cost of revision would equal the cost of a new survey. This period we will assume as 30 years, and the law for the cost of a revision can now be stated in terms of cost of an original survey—that is, that it is fractionally proportionate to the number of elapsed years since the original survey, making 30 the denominator of the fraction. Thus if a revision was made in ten years it would cost 10/30 of its original class cost.

In Departmental Committee's Report 584 square miles of 1/500 work in England, not

*A paper by J. J. Amos in the "Surveyor" for April 1, 1910. For conversion of English costs into American money, in round figures, the following equivalents may be used: £ = $5; s = 25 cts.; d = 2 cts.

including Lancashire and Yorkshire, are stated to have cost an average of 15s per acre, and 178 square miles of 1/500 work in the latter counties averaged 20s per acre; 1/2500 work in town vicinities in the remainder of England averaged 4s per acre, and in Lancashire and Yorkshire averaged 5s per acre. The town work in these two counties was a patchwork survey, partly replotted from original survey books compiled over forty years previously, and revised, and partly new survey, a process of compiling a cadastral survey most unsatisfactory. However, it will serve to prove the assumption of the thirty-year period as the life of a survey.

Cost of original 1/500 survey remainder of England 15s per acre; Lancashire and Yorkshire $40/30 \times 15/1 = 20$s per acre.

Cost of original 1/2500 survey remainder of England town vicinities, 4s per acre; Lancashire and Yorkshire 1/2500 survey town vicinities $40/30 \times 4/1 = 5.3$s per acre. This practical illustration goes far to prove the assumption made, and that it would have been more economical to have made an entirely new survey of these counties as far as the towns were concerned.

Publishing and Printing—If the zincographic process is used, the two chief items are the preparation of tracing and cost of zinc plate, the latter about 16s each; and putting the cost of tracing as equal to drawing cost, and taking the mean between close and very close, we have £2 16s for average cost per plan for tracing, or a total of £3 12s per plan. The statement that the average cost of printing per plan was £5 (*vide* committee's report) may, therefore, be accepted as a price which would allow of thorough supervision, and a fair quantity of prints being pulled.

The cost of a town actually revised and extended by Ordnance Survey will now be analyzed, first by accepting the average cost at 15s per acre, secondly by the writer having carefully classed the work, both on ground and on plans, no niggardly class being awarded.

FIRST ANALYSIS.

	£	s.	d.
21 plans, new survey, at 15s. per acre =	892	16	0
36 plans, revised (17 year period), $17/30 \times 15/1$ per acre =	587	10	5
67 plans, printing and publishing at £5 per plan	335	0	0
	£1,815	6	5
Deduction for 2572.6 acres, at 2s. per acre, for this survey, helping the general revision	257	5	7
	£1,558	0	10
Allow Ordinance Survey 5 per cent for incidentals	77	18	0
Total cost	£1,635	18	10
The town paid	3,000	0	0
Overcharge	£1,364	1	2

SECOND ANALYSIS.

	£	s.	d.
13 plans, new survey, close, at £23 1168 per plan	300	10	5
10¾ plans, new survey, medium, at £14.7972 per plan	158	2	1
7¼ plans, new survey, open, at £8.521s per plan	61	16	1
16 plans, revision, very close, at $17/30 \times £24.3528$	311	2	0
20 plans, revision, close, at $17/30 \times £23\ 1168$	261	13	8
67 plans, printing and publishing at £5 per plan	335	0	0
	£1,428	4	3
Deduct as in the first case	257	5	7
	£1,170	18	8
Allow Ordinance Survey 25 per cent for administration, as this work has been classed at piece-work rates	292	14	8
Total cost	£1,463	13	4
Paid	3,000	0	0
Overcharge	£1,536	6	8

In a written memorandum Colonel Sir C. Wilson, Director-General, Ordnance Survey, to the Departmental Committee, says: "The charge of 15s per acre is not excessive, including as it does triangulation, levelling, surveying, and the drawing of the finished plan. Considering that these partial revisions and extensions will aid the general revision, they might be carried out at somewhat reduced rates." And yet within about ten years of a director-general feeling himself called upon to defend a charge of 15s per acre for a new survey, a case occurs in which the same department make a charge of £1 3s 4d per acre, and that for revision as well as for new survey.

The following prices, suitable for any 1/500 survey, the writer has proved by experience to be perfectly just. The saving is from about 27 per cent in very open to about 55 per cent in very close work on Ordnance Survey prices. The cost of manuscript plans on any other scale can be found from these prices by the ratio the denominators of the representative fractions of the scale have to each other. Thus if an acre, very close work, costs 155d on 1/500 scale, what would it cost on 1/2500, and 1/250 scales, $500/2500 \times 155/1d = 31d$, and $500/250 \times 155/1d = 310d$ per acre? It seems unnecessary to give details of prices of the different operations.

	Very open.	Open.	Medium	Close.	Very close.
Per acre.	19.5d	38.04	67.5d	105.5d	155.0d
Per plan of 38.4 acres	£3.1104	£6.0791	£10.7904	£16,8960	£24.8064

An analysis of the cost of the survey as in the second case with these prices gives cost as	£1,067	15	5
Paid	3,000	0	0
Overcharge	£1,932	4	7

Comments on Ordnance Survey Procedure.—Their system necessitates for the completion of a portion of work the visit of at least six different persons to the ground, and the plans in the office routine pass through quite as many different hands. Generally speaking, the employes are only trained in two or three of the duties, and only a few years ago it was no uncommon case to see men who had been chain-surveying all their lives, and could not plot, etc. This system has been somewhat modified of late years. A rule-of-thumb method existed for each particular duty, and was adhered to with red-tape impartiality. In the system of one man one duty a certain number of field hands lose a good deal of time by weather conditions, and the expense of moving them about and superintending them is heavy and adds greatly to the cost of the survey.

The surveyor who completes all his work can so arrange office and field work that he obtains the best weather for the latter. By a few additional measurements and check bookings when surveying he may materially reduce the cost of plan examination. Tracing for examination can be altogether saved, as he may take his plotted plan on to the ground for examination before being drawn; moreover, the man who completes everything takes a more intelligent interest in the work than the routine man who only perhaps understands a portion of the complete processes.

Process of Revision.—A few prints are cut into convenient sized cards and handed to a reviser, who checks the work on the ground, erasing and supplying everything necessary. A final examiner checks the work on the ground; a zincographic tracing is compiled of each plan from the cards. This tracing is transferred to a zinc plate, and the revised edition printed therefrom. This zincographic tracing takes the place of the original manuscript plan, and it should be remembered that a revised plan is burdened with the errors inseparable from the various processes leading to two reproductions. The Ordnance Survey plans do not now bear the high reputation for accuracy among those using them they formerly did.

Data Obtainable from Ordnance Survey.—When extensions are required the following data should be requisitioned for from the Director-General, Ordnance Survey Office, Southampton:

(1) Co-ordinates and sheet-line distances of all trigonometrical points required.

(2) Descriptions, with measurements for refinding a few selected points.

(3) Latitudes and longitudes of the respective origin points of co-ordinates.

The latter is needed where the work concerned is projected on more than one meridian, as happens in districts around London, Newcastle-on-Tyne, etc. The above data is all computed, and the public are entitled to be supplied with it at the departmental price of copying the same. Before making the requisition the ground should be visited with a 6-in. map, and all trigonometrical stations which are required for the extension should be encircled, those of which descriptions are required being represented by a double circle. Generally a series of points outside the extension area, and all prominent points inside, such as church spires, etc., will be sufficient.

Surveyors' Qualifications.—That great care is needed in selecting surveyors for carrying on a survey, even when assisted by Ordnance Survey triangulation, the following incidents will show: A town in the North of England obtained the triangulation, and carried out a large extension, working from extreme sides of their extension and meeting in the center, where their work, although relatively correct in itself, failed to agree to 10 ft. on the plans, this result being due to want of knowledge of the methods and processes that should have been used to hold the work together. In another case the writer put a trigonometrical test on some work lately which had been extended by a system of production from internal 1/500 detail points combined with a system of chaining from three fixed points in the 1/500 work into another point, and scoring its position by the length of the lines; the work was up to 18 ft. out of position, and the money spent in obtaining it wasted.

For purely revision work a man who can chain accurately and draw neatly will suffice, but for extension work good trigonometrical experience is needed, and the method of polar and cartesian co-ordinates and the adjustment of co-ordinate traverse should be thoroughly understood. In districts where the existing maps are projected on different meridians, the calculation of geodetic latitudes and longitudes is a necessary qualification, so as to be able to calculate the projection of plan lines on to the common plans projected on another meridian. Up to 1893 about £478,000 had been paid in the United Kingdom for 1/500 survey alone, and it seems a pity that the result of such an expenditure should be allowed to deteriorate to such an extent as to become useless by lapse of time, although it is clearly evident that the expense of keeping it up should fall on the community who benefit by the map, and not on the general public.

A block survey on 1/500 scale, showing all roads, streets and frontages, etc., "the filling up being carried out only when absolutely required," could be carried out at about half the rates last quoted, and would probably meet all requirements of municipal engineers in extending towns.

Example of The Relocation of Roads in Hilly Country.*

The causes leading up to and which, at the present day, demand relocation of improved roads, date back to the very early history of our country, when our forefathers began to settle here and there in what was then an unbroken wilderness, and when it became of the utmost importance to have communication between the different settlements for their mutual protection against the invasion of the Red Man of the forest. Then it was that mere foot paths were blazed through the forest and opened up from one settlement to another, regardless of any feasible route. These soon became bridle paths, later to become cart paths and highways. Many of such roads that to-day are our public highways were never surveyed or legally laid out and recorded upon our county records. As time passed and it became the custom to have the roads legally laid out, but little more attention was paid to the location in order to eliminate grades. When John Jones believed it would be to his interest to have a public highway laid out, passing his door and extending through his brother Hiram's place, they made application to the court of the county asking for the appointment of highway surveyors to lay out a public road, begin-

*From a paper by A. H. Konkle, County Engineer of Sussex County, N. J., read before the Association of County Engineers, and printed in the Annual Report of the State Department of Public Roads.

ning at a certain well-defined point and running in a certain direction to another well-defined point, the place of ending. You will see that the route was generally defined in the application, regardless of hills and grades that might be encountered, before ever the surveyors went upon the ground, so that if the surveyors were at all inclined to select the best route, their hands were virtually tied as to the best location and most feasible route. The writer well knows from long years of experience, as both practical surveyor and highway surveyor, wherein he has been an unwilling party, and, in more than one instance, where he has utterly refused to lay out a road over the ground selected by the applicants. To-day these are some of the roads that we are called upon to improve.

I have now briefly outlined the causes that made it imperative for modern road improvement to relocate in part, or in the whole, the road to be improved, in order to meet two requirements—first, to bring the grades within the maximum limits required by the State authorities; and second, to reduce the expense of such improvement to a minimum.

Sussex county was one of the last counties in the State to commence the improvement of its highways and has progressed slowly, there now being only about 30 miles of improved roads finished and in process of completion, five miles of which have been built without State aid, and upon that portion the grades were not kept down to the State's requirements. The roads so improved have all been under the writer's supervision and have generally been the main roads leading over the mountains, the most difficult sections to improve, as to question of grading. To reduce grades, running anywhere from 12 to 18 per cent, down to 5 per cent, and, at the same time, keep down the expense of such improvement, is no easy problem.

In 1903 there were improved 1¾ miles of road leading over the Blue Mountain. This road was a portion of an old turnpike having grades reaching 12½ per cent, climbing a hill, dropping into a valley, again climbing another hill, and so on to the top of the mountain. It was relocated its entire length, and, in relocating, the contours of the mountain were followed up a ravine and no grade exceeded 5½ per cent, and in no place in the entire length was any reverse grade encountered. The cost of the road was far less than it would have been had the line of the old road been followed, even though with a far greater per cent of grade, and by such change the length was increased but 600 ft.

Within the past year another portion of the same turnpike has been improved from the summit of the mountain down the same, and through the foot hills to the borough of Branchville, a distance of 3½ miles. The old road showed grades of 14 per cent, while the improved road was constructed on a maximum grade of 4½ per cent by relocating two sections at a greatly reduced cost from that required to grade the old road with an additional length of only 390 ft. over that of the old road.

A portion of the Morris turnpike, leading from Newton to Stanhope, a distance of 9¾ miles, is now in process of improvement. This road also crosses a mountain, and, as originally laid out, showed grades of 15 per cent, with no possible way to cut them down to the requirements without a heavy expense, but by relocation in five separate short sections, at a nominal expense, the grades were brought down to a maximum of 5 per cent, and by the several changes the length was increased only 164 ft. over that of the old road.

Another road under the writer's charge, leading from the celebrated mining town of Franklin Furnace over the Stockholm mountain to the Passaic county line, a distance of 5¾ miles, was surveyed last year and is now under construction. This has been one of the most difficult problems the writer has had to contend with. The grades of the old road reaching 17 per cent, about two-thirds of the entire distance was relocated, mostly through the forest and at a maximum grade of 6 per cent. This relocation cut out several very dangerous railroad crossings and required the building of one bridge 210 ft. in length, crossing a ravine and the railroad. This bridge will cost about $10,000, which the railroad company has agreed to build in consideration of the elimination of the several grade crossings, which elimination was possible only by relocation of road. The improved road will be three-eighths of a mile shorter than the old road.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Electrochemical Society.—May 5-7. Annual meeting at Pittsburg, Pa. Secy., Jos. W. Richards, South Bethlehem, Pa.

Appalachian Engineering Association.—May 6-7. Annual meeting at Winston-Salem, N. C. Secy., Henry M. Payne, Morgantown, W. Va.

National Fire Protection Association.—May 17-19. Annual meeting at Chicago, Ill. Secy., Franklin H. Wentworth, 87 Milk St., Boston, Mass.

American Railway Association.—May 18. Annual meeting at New York City. Secy., W. F. Allen, 24 Park Pl., New York City.

International Railway Fuel Association.—May 23-26. Annual meeting at Chicago, Ill. Secy., D. B. Sebastian, 327 La Salle Station, Chicago, Ill.

National Electric Light Association.—May 23-28. Annual meeting at St. Louis, Mo. Secy., T. C. Martin, 29 West 39th St., New York City.

American Society of Mechanical Engineers.—May 31-June 3. Spring meeting at Atlantic City, N. J. Secy., Calvin W. Rice, 29 West 39th St., New York City.

Engineers' Society of Pennsylvania.—June 1-3. Annual convention at Harrisburg, Pa. Secy., E. R. Dasher, Gilbert Bldg., Harrisburg, Pa.

Personals.

The General Contracting & Engineering Co. has removed its offices to 29 Broadway, New York City.

Henry H. Heinemann, a contractor of Chicago, Ill., died suddenly Apr. 22 at St. Louis, Mo., from apoplexy.

T. C. Lea, Deputy County Surveyor of Jackson County, Mo., died last week at his home in Independence, Mo., aged 71 years.

Messrs. C. A. Edel and W. D. Janney have resigned their positions as Assistant Engineers to the Harbor Board of Baltimore, Md.

Mr. Manton Hannah of Austin, Tex., has been appointed Consulting Engineer in the matter of sanitation to the Texas State Board of Health.

Mr. F. J. Angier has resigned his position as Superintendent of the Wood Preserving Department of the Chicago, Burlington & Quincy R. R. to accept a position with the Kettle River Treating Co.

Mr. A. S. Kent has been appointed Engineer of Maintenance of Way for the Monon road, with headquarters in Chicago, and Mr. Anton Anderson has been appointed Division Engineer of the first and second divisions, with headquarters at Lafayette.

Alexander McDonald, a well known Civil Engineer of Schenectady, N. Y., died Apr. 20. He was 44 years of age and had lived in Schenectady all his life. He was graduated from Union University with the class of 1890 and was formerly Assistant City Engineer of Schenectady.

Mr. J. B. Carothers, formerly Superintendent of the Illinois division of the Baltimore & Ohio Southwestern R. R. at Washington, Ind., has been appointed Chief Engineer of Maintenance of Way to succeed Mr. Earl Stimson, who has been appointed Chief Engineer of Maintenance of Way for the Baltimore & Ohio R. R.

Mr. Geo. W. Arnold, who has been Engineer in Charge for the construction of a number of large tunnels within the past few years, has been appointed Division Engineer for the Western Maryland Ry. on the construction of several tunnels and heavy grading in Pennsylvania. Mr. Arnold will establish offices at Meyendale, Pa.

Mr. J. Edward McDonald, Attorney, of Winnsboro; Mr. William H. Riggs, Director of the Department of Engineering in Clemson College, and Mr. Thomas N. Raysor have been appointed members of the recently authorized State Public Service Commission of South Carolina. The commission will have general supervision of public service and charges therefor throughout the state except in the counties of Charleston, Marion, Spartanburg, Sumter, Union and Horry, which are expressly exempted.

Mr. John A. Byrne has been appointed Engineer in Charge of the Queens Borough Water Department of New York City to succeed Mr. Leonard C. L. Smith. Mr. Byrne, whose home is in Yonkers, some years ago was connected with the Water Department, under George Creed. His present appointment will not include the charge of the Water Register Department, which usually has been given over to the Engineer, as it has been decided to appoint a man to care for that branch.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Manganese Steel.—Manganese Steel Rail Co., Paterson, N. J.

This company sends out reprints, in pamplet form, of articles published in different engineering periodicals as follows: The Manufacture of Manganese steel products 8½ x 12½ ins., 3½ pp., "The Iron Age" of Sept. 30, 1909. Rolled Manganese Steel Rails, 8 x 6½ ins., 7 pp.; giving life of rails and comparative tests, "Railway and Engineering Review" of Mar. 13, 1909. Physical Properties of Manganese Steel, 6 x 9 ins., 31 pp.; "Journal of the Western Society of Engineers." Life of Manganese Steel Rail on Curves, 6 x 9 ins.; 7 pp.; "Electric Ry. Journal," Oct. 17, 1908, being tests for wear on the elevated division of the Boston Elevated Ry. Co.

I-Beam Trolleys and Chain Block Traveling Cranes.—Paper 6 x 9 ins.; 12 pp.; Pawling & Harnischfeger Co., Milwaukee, Wis.

Steel Piles.—Folder 4 x 9 ins.; 8 pp.; The Underpinning Co., 290 Broadway, New York, N. Y.

Illustrative and descriptive pamphlet.

Water Works Specialties.—Paper 6 x 9 ins.; circulars Nos. 1 to 5 of 10, 11, 11, 6, and 4 pp., respectively. The Simplex Valve & Meter Co. 112 N. Broad Street, Philadelphia, Pa.

These circulars contain good illustrations and descriptions together with tables of the various devices manufactured by the company.

Oil and Gas Engines.—The De La Vergne Machine Co., New York City; paper 9 x 6 ins.; 84 pp.

Complete of oil engines; also folders 4 x 8¾ ins. of two cycle engines, four cycle gas engines and heating lamps; also Bulletins No. 98 and 101, paper 8 x 10½ ins.; 12 pp. each, being descriptive of oil engines of two types manufactured by this company.

Climax Road Machines.—Paper, 8x10¾ ins., 16 pp. Climax Road Machinery Co., Marathon, Cortland County, New York.

An illustrated catalog of various kinds of machinery for making and maintaining of roads.

Supplies and Machinery.—Cloth, 7x9⅝ ins., 952 pp. Catalog No. 50. H. Channon Co., Market and Randolph Sts., Chicago.

This is the last published general catalog of this company.

A concise and comprehensive catalog containing the descriptions, lists, tables, illustrations and prices of machinery and supplies for railroads, factories, mines and all kinds of construction work.

Cement Workers' Tools.—Paper, 3⅛x6¼ ins. 48 pp. The Contractors' Tool Co. Philadelphia, Pa.

This is a very complete pamphlet of tools for cement work. It is illustrated throughout, showing cuts of high grade tools made of bronze and also with cuts of the cheaper grades of tools. It also gives prices.

Pipes for Hydraulic Dredges.—Paper, 9½x6¼ ins., 8 pp. The Norborn Engineering Co., 11th and Market Streets, Philadelphia, Pa.

This is a catalog of land and pontoon pipes for hydraulic dredging. It gives cuts of the pipe, valves, etc., and illustrations of work being done. The catalog also contains tables of size, thickness, weight and price per lineal foot of pipe.

Dumping Wagons.—Paper, 9x6 ins., 24 pp. Watson Wagon Co., Castanova, New York.

This is a well gotten up catalog containing cuts of dump wagons of from 1 to 3 cu. yds. capacity. A good description of each wagon is given, including dimensions of parts, weights, etc.

Metal Hose.—Paper, 3½x6½ ins., 12 pp. Pennsylvania Flexible Metallic Tubing Co., 1305 Arch St., Philadelphia, Pa.

A catalog of cuts and prices of high pressure hose for steam, hydraulic, and pneumatic use.

Sectional Concrete Piles.—Paper, 4½x7 ins., 16 pp. The Holmes Caseless Sectional Concrete Pile Co., Real Estate Trust Bldg., Philadelphia, Pa.

A description of a method of making and placing concrete piles in sections by the use of a jet, and without the use of a pile driver.

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The directors of the Atchison, Topeka & Santa Fe Ry. have approved a budget for improvements calling for an expenditure of $31,000,000.—The latest development in railroad construction work in Texas is that the Southwestern railroads have served notice upon the Texas Railroad Commission that they will be compelled to cut the planned improvements and extensions for the next two years aggregating $25,000,000, to not exceeding $10,000,000, if the farmers get the reduction in cotton rates asked for. The expenditures contemplated by the railroads include the construction of about 150 miles of new road, building of several extensions, and new equipment, in addition to maintenance, and the usual renewals and repairs. The railroads claim the proposed reduction in the cotton tariff will reduce the earnings of the Texas lines a little over $1,300,000 annually.—An interesting development in the northwest is the report that ex-Senator William A. Clark, of Montana, and James J. Hill, have joined hands with a view to a combined railroad invasion of Washington, Idaho, Oregon, Montana and California. It is stated that a considerable portion of the Clark millions will be invested during the next few years in railroad ventures in the Northwest, which will be planned with a view to occupation of all territory that promises to become tonnage producers. Just now Senator Clark is said to be interested with Mr. Hill in the construction of the Gilmore and Pittsburg Railroad and in the North Coast line which Robert Strathorn of Spokane is promoting.—The municipal government of the Port of Vera Cruz, Mexico, has applied to the Mexican government for permission to make a loan of $2,000,000 for the construction of a water supply scheme for the city.—Bids are now being asked by George C. Ralph, State Drainage Engineer of Minnesota, at St. Paul, Minn., for the construction of several large ditches. The ditches will be over 200 miles long, will drain 200,000 acres and will require the moving of 3,500,000 cu. yds. of dirt.—Among the railway construction contracts recently let are the following: Timothy Burke, Scranton, Pa., for change of alignment for the D. L. & W. Ry. between Analominch and Henryville, Pa., the work including 20,500 cu. yds. concrete masonry, 54,000 cu. yds. rock excavation and 198,500 cu. yds. earth excavation; Felt & Eastman, Tacoma, Wash., for constructing a portion of the projected interurban line of the Seattle-Tacoma Short Line Ry.; Newkirk-Powers Construction Co., Joliet, Ill., for replacing 20 small bridges on the line of the Elgin, Joliet & Eastern R. R., which is to be double tracked; C. M. McConnico and J. S. Moore, of Lufkin, Tex., for grading from Temple, Tex. to Hamilton, for the Temple Northwestern R. R.; Taylor Bros. Construction Co., Bingham, Utah, sub-contract for work on the railroad now being built from Bingham, the contract including 150,000 cu. yds. of rock excavation and 15,000 cu. yds. of tunnel work; O'Boyle Bros. Construction Co., Sault Ste. Marie, Mich., for grading for nine miles of line for the Algoma Central R. R.; Smith Bros., Memphis, Tenn., according to reports, for constructing the Joplin, Oklahoma & Western R. R. from Joplin, Mo., to Bartlesville, Okla.; Walsh Construction Co., Davenport Ia., for grading second track on St. Louis, Iron Mountain & Southern Ry., between Bald Knob and McAlmont, Ark.; Ball & Peters, Little Rock, Ark., for second track grading for the St. Louis, Iron Mountain & Southern between Diaz and White River Bridge, Ark., and between Poplar Bluff at Harviell, Mo.; Burke & Joseph, Cape Girardeau, Mo., for trestle bridging for the last two mentioned contracts; and T. B. Jones & Co., Louisville, Ky., for second track grading between Jefferson City and Cole Junction for the Missouri Pacific Ry.

A Railway Reconnaissance of 1910 and a Trip in 1870.

The inspection of the proposed route of a projected railway preliminary to ordering the starting of surveys is not nowadays, in most cases, the tiresome and often disagreeable task that it was when this country was young and unsettled. In a recent inspection of the proposed route of a railway to extend from Tucson, Ariz., to a terminus on the gulf of California the railway officials used automobiles for the greater part of the distance and could have covered the entire route had the supply of gasoline held out. The name of the railway is the Arizona, Mexico & Gulf of California R. R. and it is to be built from Tucson to a little bay between Point Lobos and Cape Tepoca, a distance of 210 miles. In a recent issue of the New York Sun Mr. V. L. Mason, vice president of the company, describes the inspection trip, and we have abstracted the following from his description:

"We left Tucson in four automobiles and a fifth came later with the surveyors' instruments. We used the autos for 150 miles, all the way to Caborca, the road that far being fairly good. In fact, we might have driven the automobiles all the way, only we found at Caborca there was no gasoline to be had, and that town is 90 miles from a railroad, so as the machines had just enough fuel to take them back to the next town where some gasoline was, we sent them back and went on in four horse wagons of the old prairie schooner type. We spent the first night at Sasabe, on the border, camping out in tents. The next night we stopped at the Desaeo ranch, where some of the party slept in the hayrick with their blankets wrapped around them, and some put up in a shed. We reached Caborca the third day. Caborca is a town of about 3,000 inhabitants typically Mexican in appearance, the houses being of one story and built of adobe and the streets dusty. One of the autos broke its gear when we reached Caborca and another had broken down the first day of the journey, so there were only three to be sent back. When we learned there was no gasoline to be had in Caborca we telegraphed to Altar and were informed that there was just 30 gallons in that town. We had 15 gallons in reserve on the running boards of the cars. The men who took the cars back to Altar reported later that somebody had sold them kerosene at a dollar a gallon and they had to empty out their tanks. They finally got the gasoline.

"We made the journey from Caborca to the gulf in about 24 hours, passing one night at a little hamlet called Pitaquita. There was no real road beyond Caborca, but somebody had driven over the country. In the latter part of the journey we passed through a region that was evidently rich in game. While we were going through a mountain pass we saw several antelope, and one of the party got out and killed one. Big horn seem to be numerous. We had ordered a steamer to come up from Guaymas to meet us. She was called the General Minas, and she was a wonder. However, she was useful making soundings in the harbor and to determine the best places for our wharves. We stayed at Port Lobos four nights, sleeping in tents. It was cool all the time, and at night I had to sleep in my regular clothes, a sweater and three blankets. That coast has a mountain range running along it almost at the water's edge for hundreds of miles, but at Port Lobos there is a large flat area. The waters of the harbor teem with fish. One day three men of the crew of the steamer caught 200 sea bass within three hours, and their average weight was six pounds. I fished one day for an hour, but lost two lines, one a brand new one, trying to catch a big bass. The last day I was there I caught a fish that weighed 50 pounds, but none of our party knew what it was. Our Chinese cook insisted it was a sturgeon and was dressing him to cook when some of the Mexicans came ashore and told him that the fish was nothing but a young shark. The cook was so disgusted he went and dug a hole and buried it."

The following item from the Pioneer Press of St. Paul, Minn., of April 17, 1870, describes a trip of a different kind, made under conditions more difficult than the one above mentioned. In passing it may be noted that the J. J. Hill mentioned in the item is the present head of the Great Northern Ry. and the other roads that go to make up the great Hill system of railroads:

"Mr. J. J. Hill, who left here for Fort Garry, is having a strenuous experience together with his stage companions in forcing their way through the huge snow drifts which have recently fallen in that district. At one place the driver, agent and passengers had to shovel their way for over 20 miles. Several nights they were obliged to lie out and they were obliged to send a man in on foot to bring back a fresh team, as the one they had was completely exhausted. At Old Crossing Mr. Hill bought a dog train and proceeded on his journey.

"Forty miles this side of the Grand Forks of the Red River and probably about 22 miles north of Georgetown, Mr. Hill, while in camp for the night, heard the barking of dogs some distance away. Upon reconnoitering he was pleasantly surprised to find encamped his old friend Judge Malmros, who was on his way to St. Paul. They moved their camps together and a most enjoyable evening was spent. Mr. Hill took this opportunity to deliver to Judge Malmros a box of cigars sent him by Hon. Charles Scheffer, and rarely were fine cigars more enjoyed than on that evening in the midst of long stretches of mountainous snow drifts. Judge Malmros, who is now in St. Paul, says he was compelled to camp six nights in the open. He says Mr. Hill has a splendid 'team' of dogs, the best that could be found anywhere, and was getting along capably. The dog sledges are flat bottomed, like a long slab, with the forward end curved upward, and 8 or 9 ft. long and from 12 to 14 ins. wide—being some 2 ins. narrower at the rear. He describes President Riel, the leader of the rebellion, as a young man of great daring, energy and perseverance, and in many respects fitted to take a lead in such a movement."

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

Contracts for second track work on the Missouri Pacific Ry. system have been let as follows: Contract for grading second track on the St. Louis, Iron Mountain & Southern Ry. Co. between Bald Knob and McAlmont, Ark., was let to the Walsh Construction Co., Davenport, Ia.; for second track grading between Diaz and White River Bridge, Ark., and between Poplar Bluff and Harviell, Mo., contract was let to Ball & Peters of Little Rock, Ark.; contracts for trestle bridging for all of the above work was let to Burke & Joseph of Cape Girardeau, Mo.; contract for second track grading on the Missouri Pacific Ry., between Jefferson City and Cole Junction was let to T. B. Jones & Co., Louisville, Ky.

COLORADO.

We are advised that the contract for constructing a branch of the Union Pacific Ry. from Wamsutter, Wyo., to Craig, Colo., has not as yet been let. It was reported that this contract had been let to Kilpatrick Bros. & Collins Constructing Co., Beatrice, Neb.

ILLINOIS.

Ryan & Connell, Fulton or Nelson, Ill., have 140,000 cu. yds. machine work and 35,000 cu. yds. side work at Fulton, Ill., which they wish to sub-let.

E. E. Headley & Son have just moved their outfit from Cayuga, Ind., to Springfield, Ill., and have commenced work on the Interurban Line that runs west to Jacksonville. They could use a lot of their old Skinners if they should come that way.

INDIANA.

The Fort Wayne & Springfield Ry. Co. has completed surveys for its projected 28-mile extension to Portland, Ind., and has partly secured the construction capital. The company will do the construction work itself. A. W. Fishbaugh, Celina, O., is Chief Engineer, and W. H. Fledderjohn, Decatur, Ind., is President.

MARYLAND.

The Elkton, Fairhill & Oxford Ry. & Power Co., recently chartered with a capital stock of $50,000, proposes the construction of a 16-mile electric railway from Elkton, Md., through Cherryhill and Fairhill in Maryland and Lewisville in Chester County, Pa., to Oxford, Pa. Hiester Hess, Elkton, Md., is interested.

MICHIGAN.

Bids are asked by F. A. Bean, Chief Engineer, Detroit, Lansing & Grand Rapids Ry., 706 Union Trust Bldg., Detroit, Mich., until noon, May 14, for all necessary surveys and plans for an electric railway about 35 miles in length from Brighton, Mich., to a point near Detroit, Mich. The official advertisement will be found elsewhere in this issue.

MINNESOTA.

Contracts have not been let as yet for the construction of the Duluth, Winnipeg & Pacific Ry., but they probably will be soon so that the work can go ahead this season. This line is a Canadian Northern project and is to extend from Virginia, Minn., to Duluth, 75 miles. H. T. Hazen, 619 Lyceum Bldg., Duluth, is Chief Engineer.

MISSOURI.

The Springfield, Nixa & Southern Interurban Ry. & Power Co. has made surveys for its projected 18¾-mile line from Springfield to the James River. The capital for construction has not been secured as yet and the time for awarding construction contracts is indefinite. Jno. Owan, Springfield, Mo., is President, and W. H. Schreiber, Springfield, Mo., is Chief Engineer.

The Missouri Bridge Co., P. O. Box 785 Kansas City, Mo., has started work on some extensive dike work on the Missouri River near Kansas City, Kan. The company also has been awarded the contract for bridge work on the Kansas, Lawton & Gulf Ry. in Oklahoma, and likewise has the contract for all the bridge work for the Interstate Ry. for its projected line from Kansas City to St. Joseph, Mo. Actual construction work on the last named contract has not been started as yet, as only part of the railway project has been financed at the present writing.

NEW YORK.

The Southwestern New York Traction Co. is having surveys made for its projected 15 mile line from Bolivar to Wellsville, N. Y. The capital for construction has not been entirely secured as yet; construction contracts, however, are to be let soon. E. M. Bedford, Southwestern New York Traction Co., Bolivar, N. Y., is Chief Engineer, and C. M. Van Curen, Bolivar, N. Y., is President.

PENNSYLVANIA.

The Delaware, Lackawanna & Western Ry. has awarded the contract for change of alignment of its line between Analominck and Henryville, Pa., to Timothy Burke, Scranton, Pa. The contract includes 198,500 cu. yds. earth excavation, 54,000 cu. yds. rock excavation and 20,500 cu. yds. concrete masonry.

SOUTH CAROLINA.

Surveys for the projected 32-mile electric railway of the Greenville & Spartanburg Ry. Co., which is to extend from Greenville, S. C., to Spartanburg, S. C., line not as yet completed, and no decision has been reached as to when contracts will be let. In our last issue we erroneously reported that William J. Oliver, Knoxville, Tenn., had been awarded the contract for this line.

SOUTH DAKOTA.

Surveys have been partly made for the projected 140-mile line of the Iowa & Dakota Interurban R. R. Co., and construction contracts are to be let soon. This company was recently incorporated with a capital stock of $500,000 to construct a line from Sioux City to Mitchell. L. F. Phillips, Wagner, S. Dak., is President.

TEXAS.

The Gainesville, Oklahoma & Western Ry. has made preliminary surveys for its projected 54-mile line from Gainesville, Tex., to Bridgeport. It is proposed to let construction contracts some time the latter part of May. Jas. Whaley, Gainesville, Tex., is President, and F. B. Truax, Gainesville, is Chief Engineer.

UTAH.

The Taylor Bros. Construction Co., R. F. D. No. 2, Bingham, Utah, have taken a subcontract from the Utah Construction Co., Ogden, Utah, for work on the Copper Belt Ry., being built from Bingham. Taylor Bros. contract includes the excavation of 150,000 cu. yds. of solid rock, 15,000 cu. yds. of tunnel work and a large quantity of team work. The railroad is to be 17 to 20 miles long and will cost about $1,000,000.

WASHINGTON.

Preliminary surveys have been made for the projected 77-mile line of the Western Washington Ry. & Navigation Co. The road is to extend from Gray's Harbor to Seattle, and is to be a gasoline-electric line. The capital for construction has not been secured as yet. C. C. Quackenbush, Aberdeen, Wash., is President and W. B. Sammons, Aberdeen, Wash., is Chief Engineer.

Power Developments, Levees, Drainage and Irrigation Works.

ARKANSAS.

The Pike County Water Power Co., is having final surveys made for a hydro-electric development which will develop 10,000 H.P. Final plans and specifications have not as yet been prepared for the installation. It is proposed to construct a dam about 60 ft. in height which will back the water up the Little Missouri River about 3½ miles. The Pike County Water Power Co. has just completed arrangements for fully financing this proposition and it is probable that actual construction work will begin some time this coming summer. The Fuller-Coult Co., Chemical Bldg., St. Louis, Mo., are the engineers.

CALIFORNIA.

The Sacramento Valley Irrigation Co., Willows, Cal., is now calling for bids to be opened May 1 for the re-construction of 23 miles of main canal and five miles of new ditch, this five miles being gaps in the canal which were never completed. This canal is from 35 to 55 ft. wide on the bottom and is designed to carry 6 ft. of water. It is to be enlarged so as to carry 8 ft. The yardage involved is approximately 800,000 cu. yds.

COLORADO.

The Bent & Prowers Irrigation District propose the construction of three dams across Purgatoire River and the construction of ditches. The District expects to be in position to advertise for bids on construction work sometime in May. The District has authorized a bond issue of $4,000,000 to cover the cost of this work, and expects to irrigate some 100,000 acres of land by means of a storage reservoir of the Purgatoire River and a ditch line from it covering the lands lying thereunder. Brandby Hillyer, Lamar, Colo., is Secretary, and F. H. Whiting, Denver, Colo., is Engineer in charge.

Bids are asked by San Luis Valley Irrigation District, D. Miles, Secretary, Center, Colo., until 2 p. m., May 25, for the construction of a dam and spill-way at the Rio Grande Reservoir site, located about 30 miles west of Creed, in Hinsdale County, Colo. The dam is 450 ft. in length, 100 ft. high, 30 ft. wide on top, and involves the placing approximately of 68,000 cu. yds. of loose rock fill, 120,000 cu. yds. of earth fill, and 7,000 cu. yds. of rip-rap. Plans and specifications for dam and spillway can be seen at the office of district in the town of Center, or at 205 Boston Bldg., Denver, Colo.

IOWA.

Bids will be received at the office of C. W. Duke, auditor of Page County, Clarinda, Ia., until May 10, for the construction of the Coin-Blanchard drainage ditch. The ditch will be 28,000 ft. long and will require the moving of 233,000 cu. yds. of earth. It is to be constructed to straighten Tarkio Creek.

ILLINOIS.

Bids are asked by the commissioners of the Keithsburg Drainage Disrict, F. B. Wickett, commissioner, Keithsburg, Ill., for the construction of 182,000 cu. yds. of levee and 60,000 cu. yds. of main ditches. Harman En-

gineering Co., 120 Fredonia Ave., Peoria, Ill., is the engineer. Official advertisement will be found elsewhere in this issue.

KANSAS.

Burns & McDonnell, consulting engineers, Scarritt Bldg., Kansas City, Mo., are preparing plans and specifications for a concrete dam to be built across the Arkansas River at Wichita, Kas. Bids for the construction of the dam are to be taken as soon as the plans and specifications are completed. The dam will cost about $25,000.

MICHIGAN.

The city of Grand Rapids, Mich., has awarded the contract for excavating in Grand River and constructing embankments along the dock lines of Grand River, with cutoff embankments at lower ends south of Wealthy Ave., to Albert H. Prange, Grand Rapids, for the sum of $83,310.

MISSISSIPPI.

But one bid was received April 19 at the U. S. Engineer's Office, Vicksburg, Miss., for furnishing about 36,000 cords of brush and poles for revetment work in the Third District of the Mississippi River Commission. This bid was submitted by C. W. Hunter, Memphis, Tenn., and was $1.68 per cord of 128 cu. ft.

The following bids per cubic yard were received April 18 at the U. S. Engineers' Office, Vicksburg, Miss., for furnishing about 20,000 cu. yds. of stone: Guy Dickinson, 111 Center St., Little Rock, Ark., delivered by rail at Luna Landing, Ark., $2.50; F. W. Katterjohn, Paducah, Ky., by rail at Greenville, Miss., $2.16, by rail at Southern R. R. south of Greenville, Miss., $2.16; Oscar F. Barrett, Room 513, Chamber of Commerce, Bldg., Cincinnati, O., on barges at Greenville, Miss., $2.10; Foster-Creighton-Gould Co., No. 3 Berry Block, Nashville, Tenn., by rail at Greenville, Miss., Southern R. R. tipple, $1.99.

MONTANA.

Robert Russell, General Contractor, Valier, Mont., has been awarded the contract at Valier by the Conrad Land & Power Co. to build the irrigation system which consists of over 2,000,000 yards of work. At the present time the contractor has seven steam shovels, four drag lines and 200 teams at work.

SOUTH DAKOTA.

The Dakota Power Co., R. M. Fulweiber, Chief Engineer, Rapid City, S. Dak., is to install a plant of 1,500 K. W. generator capacity. The plant will include a pen-stock of 85 second feet capacity, 2,000 ft. long, with gates, etc., head 280 ft., water wheels, governing apparatus; generators of approximately 400 or 500 K.W. units; exciters, switch boards, switches, measurement, controlling and protection apparatus, transmission line approximately 12 miles long, transformers, sub-station, etc. Generator and line voltage will be 15,000 volts.

TEXAS.

C. H. Wier, Hempstead, Tex., wants bids for contracts for building of a pile-jetty about 400 ft. long in the Brazos River, near Hempstead.

Chas. A. Mangold and associates have retained F. H. Lancashire of Dallas, Texas, to do preliminary work and make designs for the construction of a dam, core wall and spillway at Lake Cliff, Tex.

As previously noted in this paper the City of Austin has voted to have the old dam in the Colorado River replaced with a new structure. The price to be paid is $1,000,000, in 40 installments, six months apart, $25,000 each. The structure is to be of reinforced concrete. The crest is to be 65 ft. above low water in the river. The structure will call for about 50,000 bbls. of cement and 180 tons of steel. J. C. Dumont, at present in Austin, is the contractor.

It is reported that grading will be finished in about 90 days on the branch of the Chicago, Milwaukee & Puget Sound Ry. from the main line at McLoughlin, S. Dak., about 25 miles west of the Missouri river, north to a crossing of the Cannon Ball river to the western boundary of the Hettinger county, at New England, 135 miles.

Frank E. Scharff of Lincoln, Neb., who purchased the right of way and all assets of the Omaha & Nebraska Central R. R. project at receiver's sale, has asked the Hastings City Council for a franchise giving the Omaha, Western & Lincoln R. R. Co. the right to use certain streets. The Omaha, Western & Lincoln has taken over the assets purchased by Mr. Scharff, and is said to have European capital available to construct the road as soon as complete right of way and terminal franchises are obtained. The plans prepared for the road contemplate construction and equipment complete that will cost $27,000 per mile. The route will be from Omaha to Hastings along the projected Nebraska Central line, with a branch from the Platte River to Lincoln.

The Louisville Traction Co., Louisville, Ky., has been petitioned to extend the Orell suburban line from its terminus at Orell to Kosmosdale, a distance of about three miles.

Col. T. Moore Jackson, Clarksburg, W. Va., who is promoting a project for the construction of an interurban line from Sisterville, W. Va., to Middlebourne and Clarksburg, has been over the proposed routes to decide on which will be the best one to follow.

The Nebraska Traction & Power Co. of Omaha, Neb., is to extend its line from Ralston to Papallion, Neb., and the work on the extension will begin in the near future. This interurban line now runs from Omaha to Ralston.

The Jacksonville Electric Co., Jacksonville, Fla., is reported to have secured the necessary material for the extension of the street car lines from their present termination at Phoenix Park to Cummer's Mill at Jacksonville.

C. E. James, Chattanooga, Tenn., has applied to the City Council of that city for a franchise for a new electric railway for that city and suburbs.

The St. Johns River Terminal Co., O. H. Grady, Superintendent, Macon, Ga., is said to be planning the expenditure of $200,000 for improving its facilities at Jacksonville, Fla.

The Laurel Forks Ry. Co., of Carter County, Tenn., has been incorporated with a capital stock of $50,000 and purposes to build a railroad from Hamilton to Gouge, both points being in Carter County. The incorporators are: A. R. Flinn, T. J. McMorrough, A. S. Britt, R. B. C. Howell and Thomas G. Henson.

The Territorial Engineer of New Mexico has approved two applications for power propositions on the Penasco River in Eddy County. One of these is from W. P. Turner, W. R. Kinney and W. R. Allison of Roswell, N. Mex., for 100 second feet to produce 1,000 H.P. at a cost of $25,000. The other from Will Benson of Artesia, N. M., is for 90 second feet to produce 10,980 H.P. at a cost of $150,000. The latter project is to have five power stations.

The Coal & Coke Ry., R. H. Pembroke, Chief Engineer, Elkins, W. Va., is stated to have surveys under way of a route between Elkins and Rowlesburg, W. Va. The object is to ascertain the cost and distance, as well as other information, of building an extension of the line from Elkins to Rowlesburg.

The Tennessee, Alabama & Kentucky R. R., will probably let contracts within two or three months for the construction of that portion of its line from the Cumberland River. The projected length of this road is 230 miles and it is to extend from Chattanooga, Tenn., to Louisville, Ky., passing through Dunlap, Spencer, Sparta, Cookeville and Gainesboro, Tenn.; Tompkinsville, Edmonton and Hodgenville, Ky. Rutledge Smith, Cookeville, Tenn., is President.

The new owners of the water power at Trenton, N. J., propose the erection of a power plant along the stream, either at a point in the rear of South Warrne St., Trenton, where the Assanpink flows under the Water Power, or on a tract of land the company owns at the junction of the Water Power and the Delaware River. The power plant will be for the purpose of supplying power to manufacturing establishments. David Wharton Pepper, Jr., 1201 Chestnut St., Philadelphia, Pa., is interested.

The Cumberland & Westernport Electric Ry. Co., J. E. Taylor, superintendent, Frostburg, Md., is considering extending its line from Westernport to Keyser, W. Va.

Advices from Pachuca, Mexico, state that the construction of a large reservoir for water storage is to be immediately commenced on the Hacienda of "Pitahayas" the property of the Hoyos family. The dam is to be built of solid masonry and will be 300 meters in length and will have a maximum height of 30 meters. The storage capacity will be sufficient for irrigating ten thousand acres of land. The designs and plans were provided by a Pachuca engineering firm. The work will cost in the neighborhood of $100,000.

Pennsylvania R. R., Geo. P. Miller, principal assistant engineer, Jersey City, N. J., will probably have work started this year on the addition of two tracks between Colonia, N. J., and Waverly and running through Elizabeth, and the straightening of all curves between Rahway and Newark, N. J.

The state of Durango has given a franchise to Francisco Neugebauer for the construction of a railroad from the terminus of the International at Tepehuanes to the Guanacevi. The concession grants the privilege of constructing a broad or narrow gage road and steam or electric power may be used. The principal offices will be located at first in the city of Durango, afterwards branches may be established in any part of the republic.

Albert Emanuel and William R. Sullivan, of Dayton, O., are to apply to the City Council of Sheridan, Wyo., for a franchise for an electric plant and an electric railway for that city. It is proposed to construct about 15 miles of track, three of which will be in the city, and the remainder will reach the Koot coal camps via Fort Mackenzie. The estimated cost of the project is $500,000.

As previously noted William P. Woods has been granted a concession by the Mexican Government to build a railroad from Santa Lucrecia, on the Veracruz and Pacific, to Campeche, a distance of 750 kilometers. The road will be known as Veracruz, Tabasco and Campeche Ry. At Campeche connection will be made with the United Railways of Yucatan. A subsidy of 12,500 pesos per kilometer was granted by the government along with the concession. This subsidy, it is estimated, will pay half the cost of the road's construction. The Veracruz, Tabasco & Campeche Railway Construction Co., S. A., has been organized to construct the railroad. Among those interested in the company are J. B. Body, Frederick Adams and T. J. Ryder, connected with the Sir Weetman Pearson interests in Mexico; D. Chapeaurouge and J. J. Lemmens, of the Banco Internacional é Hipotecario; F. W. Johnstone, A. L. Van Antwerp, H. C. Dinkins, M. S. McKay, C. T. Ambridge and C. S. Hartmann, railroad men; Lic. Emilio Pardo, Jr., Lic. Isidoro Sternfeld, E. T. Bailey, Charles L. Seegar, A. E. Warswick, Albert Pepper, Thomas L. Phillips, Carl Heynen, D. J. Bohan and Dr. Charles S. Dolley, all of the City of Mexico.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Thurston H. Allen, C. E. Florence, Ala., has completed a horseback survey of a proposed route for an electric railway from Huntsville to Florence, which is projected by eastern capitalists. The proposed route passes through a country that is rich in water power facilities and the road would open up a rich timber and agricultural section.

Steps are being taken at Tuscaloosa to build a mineral railroad to Brookwood, and a committee has been appointed to raise subscriptions for the work. A. S. Van de Graaff. Tuscaloosa, is interested.

Reports from Huntsville state that preparations are being made for the resumption of the work of construction of the Monte Sano Electric railway. The railroad was started last spring but suspended after half a mile of track had been laid and put in operation.

The Noccalula & Southwestern R. R., a new company, is asking a franchise at Gadsden to build an electric railway to Lookout mountain, the steel plant and Attalla, has engineers now in that city on the preliminary work.

A company has been organized at Guntersville, Ala., in Marshall county, to build an electric light plant at that place. D. C. Jordan is president, J. H. Carter, vice-president, and Alex Gilbreath, treasurer.

The Union Springs & Northern R. R. Co., W. M. Blount, President, Union Springs, Ala., is reported to have secured $500,000 for the extension of the road to Milstead and the purchase of the 9-mile road extending from Milstead to Tallassee. J. W. Wright, Jr., Union Springs, has the contract.

A company owning a 2,680 acre tract in Blue Cane township, Clay county, is to established a town site there and propose to build a branch line to a connection with the St. Louis, Kennett & Southeastern R. R. S. R. Simpson, Rector, Ark., and Frank Shelter, Kennett, Mo., are interested.

The Iron Mountain R. R. has commenced operations on the reconstruction of its branch from Fort Smith to Greenwood, and it is reported that as soon as the work is completed the line will be extended to Gurdon.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Iron Mountain Ry. (Missouri Pacific system) is to rebuild its coal docks at Van Buren, which were recently destroyed by fire.

The Board of Trade of Pine Bluff has been advised that Pine Bluff must raise a bonus of $100,000 and right of way through the city and county in order to have the Memphis, Paris & Gulf R. R. build there from Murfreesboro via Arkadelphia. It is the purpose of the company to build from Pine Bluff to Helena, the latter city having already pledged a bonus and right of way.

Construction work was started at Rogers on April 18 on the Tontitown-Cave Springs Ry., the extension of the Arkansas, Oklahoma & Western. This road will extend from Cave Springs to Tontitown, the Italian colony, a distance of seven miles. The road will be finished in 90 days and will practically give Tontitown a Frisco connection.

The Red Cloud copper mine on Rush Creek, near Mountain Home, has awarded a contract for the contruction of an aerial cable from the mine to Buffalo, in Baxter county, a distance of six miles. The tram road will be used at first for handling only the ore of the Red Cloud mine, but will later be used for custom hauling for the Buffalo district to the railroad.

The Chicago, Rock Island & Pacific Ry. has already spent $300,000 on its yards and shops now under construction at Biddle near Little Rock, and will expend $150,000 on the work this year. Only about one-half of the track scheme has been carried out in the work done so far at Biddle and this represents practically all of the $300,000 expenditure. Before work is begun on the shops, a roundhouse with a capacity of 20 engines, drawpits and turntables of size proportionate to the yards contemplated will be built. Work on the shop will probably be started by the end of this year. The improvements will represent a total of about $1,250,000.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southern Pacific Ry., W. Hood, chief engineer, San Francisco, according to reports, will double track its Sierra Mountain division from Sacramento east to Colfax, from Truckee to Reno, and will build a 30,000-ft. tunnel for a second track over the mountains.

The Power, Transit & Light Co., Harry Jastro, manager, Bakersfield, is considering a plan for building an electric railway to connect Bakersfield and the West Side oil fields.

The Elmhurst Street Ry. Co. of Sacramento has been incorporated with a capital stock of $100,000, of which $10,000 is subscribed, and proposes to build, own and operate a street and interurban railroad of standard gage with the usual overhead trolley wire system between the present terminus of the Sacramento Electric, Gas & Railway Co. opposite the East Lawn cemetery and a point at the junction of Manzanita and Helvetia avenues, Elmhurst. The estimated length of the lines of the company as thus planned are less than a mile, but the articles state that branches and extensions are contemplated as fast as traffic will justify and franchises can be secured. H. J. Goeth, Sacramento, is president, and S. P. Beere, Sacramento, is secretary.

The Western Pacific Ry. has engineers in the field for a line from Gerlach, the division headquarters, into the Surprise valley and from there to Goose Lake valley, via the Fandango pass.

The board of engineers appointed by the federal circuit court to report on the condition of the Ocean Shore Ry. has estimated that it would cost $3,190,029 to complete the line. This estimate includes the following: Completing roadbed, $1,351,115; terminal facilities, $1,227,441.36; ballasting entire roadbed, $132,320; fully equipping the road, $479,153.65. J. B. Rogers, San Francisco, is chief engineer.

The Board of Trade of Pomona is to appoint a special committee to secure a right of way through Pomona on the proposed Pomona-Claremont electric railway.

The citizens of Los Angeles have voted to bond the city for $6,500,000 to improve the harbor and develop 120,000 HP along the Owens River aqueduct.

Morris L. Brackett, a New York promoter, is reported to have sold bonds to the extent of $700,000 for financing the San Joaquin Valley Electric Ry. Co. This company projects a line to Modesto via French Camp, Manteca, Ripon and Salida. Right of way for the entire 32 miles of line has been donated by farmers. The company has offices in the Stockton Savings & Loan Society Bank Bldg., Stockton. W. H. Wallace is chief engineer.

The Sacramento & Sierra Ry., F. A. Warner, manager, Sacramento, which projects 79-mile line from Sacramento to Lake Tahoe has a large force of laborers at work clearing off the rights of way purchased by the company on the grade between Orangevale and Rattlesnake Bar, installing piles and dry walls along the waterways and preparing to construct concrete culverts. It is planned to have construction work under way all along the line by July 1. The route of this road is as follows: From Sacramento the roadbed will run through Ben Ali, directly north of Sacramento, thence to Orangevale northeasterly, north to Rattlesnake Bar on the American river, thence to Pilot Hill and on to Cool, and thence directly east to Greenwood, Georgetown and so on to Jackson Spring and Lake Tahoe.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Secretary of the Interior has authorized the construction of the necessary distribution system of canals on the west side of the Uncompahgre River for the Uncompahgre project. C. T. Pease, Montrose, is project engineer.

Profiles of the Thatcher lake reservoir and canal system, which is to be built near Buttes, 22 miles southeast of Colorado Springs, have been filed with the county clerk at Colorado Springs by Samuel Brown, Jr., president of the Southern Colorado Irrigation Co. The reservoir will have a capacity of 6,250,000,000 gallons of water and will cover 1,280 acres of land. It will cost $750,000. The canal which will supply the reservoir will have its intake near Little Buttes on Fountain creek. It will be four miles long. The dam of the reservoir will be 75 ft. high. The system will irrigate 40,000 acres of land. Work will be started at once. The surveys were made by H. Q. Raschahn.

The Colorado & Southern R. R., according to reports, in order to reach the iron mines of Sunrise, Guernsey and other camps of Wyoming, will connect its lines at Cheyenne the present year. The terminus of the Colorado & Southern in Colorado is Wellington. The company also has a line in operation between Cheyenne and Orin Junction, Wyo., and it is proposed to connect these two at Cheyenne, through which the company has secured a franchise for building a railroad. The company has run three surveys, one from Wellington, one from Greeley and another from a point about half way between these two towns.

The Empire Construction Co. of Denver, is making good progress with its contract for constructing the dam of the Garden Park Land & Irrigation Co., 12 miles northeast of Cripple Creek, and will complete the work about June 1. Concreting on the upper surface of the dam is now well along.

The Atchison, Topeka & Santa Fe Ry. is said to have plans under consideration for improvements to its Colorado properties which will involve the expenditure of $5,000,000. The principal improvement contemplated is the double tracking of the road between Pueblo and Denver.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Griffin City & Suburban Ry. Co. of Griffin, Ga., has been chartered with a capital stock of $25,000 and proposes to construct four miles of street railway in Griffin and suburbs. The incorporators are H. H. Bass, J. P. Nichols, D. R. Blakeley, Frank Flynt, Joseph D. Boyd, Thomas J. Brooks, J. C. Brooks, R. R. Strickland, C. M. Preston, and A. B. Aikin.

The Seaboard Air Line Ry. is reported to be negotiating for the purchase of the Augusta-Aiken interurban line with a view to using the tracks to secure an entrance to Aiken, S. C. The plan proposes the construction of a line from Aiken to Columbia and the use of the interurban tracks from Aiken to Augusta, Ga.

The Merchants' & Manufacturers' Association of Rome, Wright Willingham, chairman of the Railway Committee, has begun work at Rome raising stock subscriptions for the

construction of a railroad from Kingston to Canton, a distance of 30 miles. It is planned to secure traffic arrangements with the N. C. and St. L. from Kingston to Rome, and thus have practically a through line from Rome to Canton.

Residents of Albany are taking preliminary steps for the construction of an electric railway for that place. The company will be backed by local parties and it is planned to have construction work started by Sept. 1.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Clear Lake Orchard Co., of which Capt. R. A. Hazzard, Buhl, Idaho, and Milwaukee, Wis., is president, has begun work on the development of a tract four miles south of Buhl at Clear Lake. A two-span steel bridge is to be built over the Snake River and it is also planned to develop the power at Clear Lake.

Surveys have been made and all right of way has been secured for an electric railway from Idaho Falls to Hizer's Hot Springs. George H. Lawrence, Salt Lake City, Utah, is reported to have secured the necessary capital for construction and it is said that work will be started by July 1.

A company has been organized at Caldwell for the construction and operation of an electric railway from Caldwell to Roswell, Idaho, a distance of 15 miles. It is planned later to extend the line to Big Bend and possibly to Greenlear and Notus. H. W. Dorman, Caldwell, Idaho, is president and H. S. Kneedler, Caldwell, is secretary.

Preliminary surveys have been completed for the Boise & Butte R. R. incorporated a short time ago by the Hill interests to build a steam line from Boise northwest through central Idaho to Butte. It is stated that arrangements have been entered into with European capitalists by which abundant capital will be furnished for the enterprise and that the surveying parties are to be put into the field within a few weeks to make the final surveys and location of the road. The preliminary locations show a route starting at Butte, thence to the Big Hole river to the summit of the Bitter Root range, thence to the town of Salmon and up the Salmon river through the Sawtooth range and thence to Boise, Idaho. From thence down the Boise valley via Caldwell to the Snake river and to the Owyhee, through to Jordan valley and on to Winnemucca, Nevada.

Advices from Boise state that Wm. G. Eagleson and Lewis L. Folsom, representing eastern capitalists, have filed upon water of the Salmon river and tributaries, south fork of the Payete and tributaries, amounting to 4,370 second feet, for an irrigation project which proposes the reclamation of over 300,000 acres of land near Boise.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Tri-City Ry. Co. of Davenport, Ia., and Rock Island has accepted the franchise granted by the city of Rock Island. The franchise, which is for 20 years, provides for the privilege of laying 37 additional blocks of street car lines. The construction of these lines will cost approximately $800,000 and work must be started within 60 days.

Reports from Galena, Ill., state that Surveyor J. Carson Scott has completed the survey of a proposed line of railroad from Patch Grove, Wis., to a point on the Burlington road a short distance south of Bagley. It is said that the new road is being planned and will be built by residents of southwestern Wisconsin. Residents of Bloomington have raised money to have the survey completed to that city.

The Gant-Gilbreath Construction Co. of Chester has been incorporated with a capital stock of $10,000 and will engage in a dredging and general contracting business. The incorporators are Elmer Gant, Whitney Gilbreath, Jesse Lee Gant, and W. L. Husband.

The directors of the Atchison, Topeka & Santa Fe Ry. have approved a budget for improvements calling for an expenditure of $31,000,000. Of this $2,000,000 will be set apart for a bridge at Kansas City.

The directors of the Baltimore & Ohio Chicago Terminal Ry. Co. have authorized an issue of $50,000,000 of bonds $30,000,000 of which will be put out soon. This is the last step necessary to make the Baltimore & Ohio distinctively a Chicago road, with ample terminal facilities in Chicago.

The Newkirk-Powers Construction Co., Joliet, has been awarded the contract for replacing 20 small bridges along the line of the Elgin, Joliet & Eastern R. R., which is to double track its line. The Newkirk-Powers Co. also has the contract for the laying of 14 switch tracks to accommodate 900 cars, in the Joliet switch yards. This latter contract was let some three months ago.

The incorporation papers of the St. Louis East Side Belt Terminal Ry. Co. have been filed for record at the court house at Edwardsville. The capital stock is placed at the nominal sum of $2,500. The principal office of the company is at East St. Louis and the incorporators are Wm. H. Haas, C. T. Smiley, F. W. Kraft, A. E. Meintz and F. L. Flannigan.

The Chicago & Northwestern Rv., according to reports, will make Fulton, Ill., the terminal point for the Galena and Iowa divisions, instead of Clinton, Ia.

The Elgin, Joliet & Eastern Ry., A. Montzheimer, chief engineer, Joliet, is planning improvements which will involve an expenditure of about $500,000 and will include the double tracking of the line from Joliet to South Chicago. About $80,000 will be spent at Waukegan in improvements, including a roundhouse. The Joliet yards will be enlarged and additional car shops, coal chutes and a modern concrete roundhouse will be erected there.

The Illinois Constructing Co., of Edwardsville, has been incorporated with a capital stock of $2,500 to engage in a general contracting and railroad equipping business, the incorporators being Charles W. Terry, Charles E. Gueltig and E. C. Crane.

O. S. Tippy, of Marion, has work well under way east of Marion putting in a switch which will lead from the Black Diamond road to the new mine shaft on the Tibbs farm.

Contracts for the excavation of 70,000 yards of dirt for the right of way of the Aledo Terminal Railway Company have been let to F. J. Petersen of Davenport, Ia., and the Marble & Greer and Cass Brothers Companies.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A movement is under consideration at Utica for the construction of a trolley line to Jeffersonville, a distance of six miles. Dix Bros., Utica, are reported to be interested.

Announcement has been made that the Terre Haute, Indianapolis & Eastern Traction Co. has bought a majority of the stock of the Indianapolis Traction & Terminal Co. and that the system will be unified. The traction and the terminal company owns the Indianapolis city street railway system, including the traction terminal station, and its capitalization is something like $5,000,000. This purchase makes possible a unification of the system from Richmond to Indianapolis and thence to Terre Haute, including the lines to Lafayette, Crawfordsville, Lebanon, Danville and Martinsville and including the cities of Indianapolis, Terre Haute and Richmond, and the lines radiating from Terre Haute to Sullivan, Clinton and Paris.

The Evansville & Terre Haute R. R., J. W. Hunter, Division Engineer, Evansville, is to erect a shipping dock on the site of the old Hermann sawmill at the West Side in Evansville.

The Syracuse & Milford R. R., owned by the Sandusky Portland Cement Co., of Syracuse, which operates between its factory and Waubee Lake south of Milford, has purchased the materials for an extension into Milford.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Petitions are being circulated at Manchester for the levying of a tax to aid in the construction of the Manchester-Davenport interurban railway. It is stated that as soon as $25,000 is raised at Manchester work will be started on the first section between that place and Monticello. The contract for the construction of the entire line has been let to F. J. Cross of Monticello, Ia., and the preliminary surveys have all been made. Lafe Matthews, Manchester, Ia., is interested.

The city council of Charles City has granted a franchise to the Charles City Western Ry. and the management has decided to run the line from Charles City to Marble Rock. A survey has been completed between these two points. Work will commence on the road at once, also on the car shops and sheds, for which plans are now being completed. H. E. Bennett, Charles City, is assistant general manager.

The Scott county supervisors have passed a resolution giving the Tri-City Railway Co. of Davenport the right of way over the road to Fairmount cemetery. A portion of the road on which the track would be built when the line is constructed is outside of the Davenport city limits and it was necessary for the supervisors to grant the right of way before the street car company could build the line.

R. C. Campbell of London, England, representing English capitalists, was in Iowa City recently looking over the data for the projected Iowa City-Ottumwa interurban line. It is stated that he will return in May or June with engineers to go over the proposed route.

The Waterloo, Cedar Falls & Northern Ry., T. E. Lust, chief engineer, Waterloo, Ia., has ordered materials for the extension of its street car service at Waterloo.

The Chicago, Anamosa & Northern Ry., J. L. Kelsey, general manager, Anamosa, Ia., is reported to be considering extending its line to Waterloo from Coggon, with the ultimate intention of building the road from Anamosa to Davenport by way of Olin.

The Chicago, Burlington & Quincy Ry. is said to be preparing to have work started soon on changing its road bed for a distance of 10 or 12 miles between Keokuk and Madison. The change of tracks is made necessary by the construction of the Keokuk and Hamilton power dam and will be paid for by the power company.

The Chicago, Great Western R. R., L. C. Fritch, chief engineer, Chicago, Ill., is reported to have plans under consideration for the location of a division terminal midway between Des Moines and St. Joseph, probably at Conception, Parnell or Ravenwood. The plan is to establish a freight division about 100 miles north of St. Joseph, where a roundhouse, turntables, supply houses, coal chutes and other accessories will be built.

The Iowa Supreme Court has handed down a decision sustaining the decision of the district court at Fort Dodge, granting to the Fort Dodge, Des Moines & Southern Interurban the right to cross the main line of the Illinois Central Ry. on a grade crossing at Gypsum near that city. The decision will doubtless hasten the taking over of the Crooked Creek line by the Interurban, on which they have held an option for some time.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Missouri, Kansas & Texas Ry. is to have work started by fall on a new round house to be erected at Junction City, Kan.

The southern tier of townships in Reno county has voted bonds for the Wichita, Kinsley, Scott City & Denver Air Line road, making a total for the county of $80,000. All but four townships in Stafford county have voted bonds and these towns will hold elections May 14. Construction of the road will be commenced at Turon June 1, it is said.

The Missouri Pacific Ry. has work under way at Hoisington on the improvement of its shops and yards. It is said that the princi-

pal division part in Kansas will be made at Hoisington, and that the improvements will involve the expenditure of $450,000.

The promoters of an electric railway to extend from Omaha to Kansas City, have offered to build the line from Falls City to Sabetha this summer if right of way and terminal grounds were furnished. E. V. Kauffman, Sabetha, is interested.

The Topeka Ry. Co., of Topeka, has accepted the franchise ordinance of the city council and will commence work on the extension of its lines about June 15. About $150,000 will be expended.

The Gulf & Northwestern Ry. Co., of Goodland, is planning to have actual construction work started shortly. Permanent surveys have been run south from Goodland and across the Smoky Hill River.

Permanent surveys for the Coffeyville-Parsons line of the Kansas Union Traction Co. have been completed and officers of the company are now in New York City taking steps to finance the proposition. O. C. Randall, Altamont, Kan., is interested.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

At a recent meeting of the 5th Louisiana levee district at Delta, J. T. McClellan reported as follows regarding new work: Within the next one or two years the following new levees will have to be built on 20-year locations: Atherton, East Carroll parish, 260,000 cu. yds.; Mascot, East Carroll and Madison parishes, 400,000 cu. yds.; Morancy, Madison parish, 200,000 cu. yds.; Duckport, Madison parish, 225,000 cu. yds.; Reid-Biggs, Madison parish, 250,000 cu. yds.; Sycamore, Concordia parish, 300,000 cu. yds.; Kinmore, Concordia parish, 175,000 cu. yds.—making a total of 1,810,000 cu. yds. From the Arkansas state line to Bedford's Point in Madison parish there is needed to bring the levee 4 ft. above the 1903 water 1,840,000 cu. yds. and from Bedford's Point to Red river it will take 1,280,000 cu. yds. to bring the levees to commission grade.

The Lake Arthur, Jennings & Northern R. R., E. P. Fox, General Manager, Jennings, La., is reported to have secured the necessary capital for beginning construction on its proposed line which will give Jennings a northern outlet.

The Board of Port Commissioners of New Orleans, J. F. Coleman, Engineer, is calling for bids for new steel wharf sheds stretching all the way from Jackson to Louisiana Avenue, at New Orleans, with the exception of barely two open spaces of about 500 feet each. The new sheds will cover 3,700 ft. of space.

It is reported here in Lake Charles that a deal is pending whereby a Chicago land company will shortly acquire a large portion of the semi-swamp lands in Cameron Parish now owned by the North American Land & Timber Co. Several hundred thousand acres of land are involved, and if it is purchased the Chicago men will at once begin reclaiming it and placing it on the market. According to the report of an engineer who has just completed a survey of the land for the purchasers the problem of draining the land is simple.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Detroit, Lansing & Grand Rapids Ry. Co. has secured franchises on its projected route through every township and corporation except Williamston, East Lansing, Oneida and Grand Ledge. Negotiations are reported as well along for securing the capital needed for construction work and it is expected that at least part of the line will be built this year. Andrew Fyfe, Grand Rapids, Mich., is one of the promoters.

The Michigan Central and Pere Marquette Rys. are to abandon their joint use of tracks through Lansing and will lay separate tracks, to be followed by the erection of new freight houses. The Michigan Central will acquire all the tracks now in use jointly between Michigan Ave. and North Lansing, as well as add more trackage, and erect a freight station 400 ft. long just north of Michigan Ave. and east of the track. The Pere Marquette will lay new tracks and will cross the Michigan Central south of Michigan Ave. and run north through the city west of the union passenger station. Its freight house will be west of these tracks, between Michigan Ave. and Shiawassee St.

The Michigan United Rys. Co., A. R. Mann, superintendent, Lansing, is to double track the greater portion of Washington Ave. at Lansing this summer. About 3,500 ft. of new track will be built.

The Lake Superior & Ishpeming Ry. Co. has started a steam shovel cutting away the northern end of the old Lake Superior rock dump, at Ishpeming, in order to make room for a temporary track that will be used while the main line is being raised and connected with the structures that are to be built over the Chicago & Northwestern and South Shore tracks, also West Division St. This work is preliminary to the construction of the North Lakes branch, which is to be four miles long. Gust Fredin, Ishpeming has the contract, and Peter Nelson and Albert Lindberg have subcontracts.

The Detroit & Mackinac Ry. Co. has secured permission from the war department at Washington to cross Cheboygan River on the north side of the paper mill at Cheboygan, and is prepared to construct a bridge to span the stream, provided the city council of Cheboygan will permit them to cross Main St. with the proposed track. This is to be used for the handling of pulp wood by the Cheboygan Paper Co., the yards for the piling of pulp wood being on the east side of the river.

The O'Boyle Bros. Construction Co., Sault Ste Marie, Mich., has been awarded a contract by the Algoma Central Ry. for the construction of nine miles of line from Josephine to the Magpie mines. O'Boyle Bros. have 40 men and 15 teams at work on the contract, which they expect to complete this fall.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Drainage Commissioner, George A. Ralph, Engineer, St. Paul, Minn., is calling for bids for the digging of ditches Nos. 83, 90, 91 and 92. They will be among the largest ditches ever dug by the state. Their length will aggregate more than 200 miles. They will drain 200,000 acres and it will be necessary to move more than 3,500,000 cu. yds. of dirt.

Contractor Elzy, of St. Paul, Minn., has begun work on his double track contract with the Northern Pacific between St. Cloud and Rice.

Mississippi Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Newton Northwestern R. R. Co., has been organized by D. L. Ragland, W. A. Brown, H. C. Majure, W. V. Fant, J. C. McClinton, T. A. Baucum and W. A. Richardson, all of Newton, Miss. As proposed the road is to run from Newton in Newton county, northwesterly to Carthage in Leake county. The route covers 45 miles of road, and the privilege is given in the charter to make Carthage the northern terminal or to go to some point five or six miles distant from Carthage. The proposed line will make a junction with the Mobile, Jackson & Kansas City road and the Alabama & Vicksburg line at Newton, and will connect at Carthage or some neighboring point with the projected line of the Pearl River Valley road.

Preliminary plans have been agreed upon at a meeting of citizens to construct an interurban line between Itta Bena, Miss., and Greenwood. Eastern men are said to be behind the proposition.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Osceola state that work is to begin July 1 on a dam across the Osage River there to develop power for manufacturing and lighting purposes. The dam will cost about $100,000. It is being promoted by a manufacturing company and Osceola citizens have subscribed $10,000 worth of stock. The work will be finished Nov. 1.

The St. Joseph Belt Ry. Co. has leased five miles of its right of way in St. Joseph to J. H. Van Brunt, general manager of the street railway company, which will build a line this summer to Savannah.

St. Louis Items.

BY A. E. KOENIG.

The Walsh Construction Co. of Davenport, Ia., were awarded the contract for double tracking 47 miles of the Iron Mountain R. R., from Argenta, Ark., north.

Ball and Peters, of Little Rock Ark., secured a part of the double track work from the Iron Mountain R. R. in Arkansas the other day.

Burke & Joseph were awarded the contract for bridging and pile driving on the new double track work on the Iron Mountain R. R. in southern Missouri and Arkansas.

Articles of incorporation for the East Side Belt Terminal Railway Company of East St. Louis have been filed in Recorder William Metzger's office in Bellville, Ill. The company is capitalized at $2,500, and the incorporators are W. H. Hauss, Charles T. Smiley, F. W. Kraft, Albert E. Meints and J. L. Flannigan. The company proposes to build a belt line from Venice to Cahokia around East St. Louis.

R. H. McWilliams, Mattoon, Ill., wants a small team outfit at Kampsville, Ill. Will either let the work or hire teams at $4 per day.

The Board of Public Improvements is to let contracts May 13 for the improvement of the following 16 streets: Asphalt—Laurel, between Ridge and Wells; Holly, between Penrose and Carter; High, from Franklin to Biddle. Brick—Coleman, from Montgomery to its intersection with Garrison; Penrose, between Grand and Prairie; Taylor, between Ashland and Margaretta; Palm, between Broadway and Fourteenth; Gravois, from Arsenal to Grand. Granite—Walnut, from Tenth to Twelfth. Bitulithic—Adelaide, from Florissant to Rosalie. Telford—King's Highway between Gravois and Nottingham; King's Highway between Nottingham and Arsenal. Wood Blocks—Washington, from Fourth to Twelfth; Fourth, from Chestnut to Washington; Washington from King's Highway to Union; Rauschenbach, from Benton to Hebert.

C. W. Prosser is building the depot, hotel and office building for the Kansas City Southern R. R. at Heavenor, Okla.

The Ryan Bros., Dick, Tim and Pat, passed through St. Louis on their way from Hot Springs, Ark., to Hawerden, Ia., where they have a job on the Chicago & Northwestern Ry.

The MacArthur Bros., Fisher Bldg., Chicago, Ill., have several pieces of nice team work to let on the Burlington extension in Wyoming. Contractors in the neighborhood of St. Louis or Kansas can see profile and get prices at Koenig's Labor Agency.

S. C. Hitchcock, Vice-President and General Manager of the MacArthur Bros. Co., spent a couple of days in St. Louis and left for Kansas City to show contractors what they had to offer for team outfits on their Powder River extension work on the Burlington R. R. in Wyoming.

Geo. H. Lawrence is going to be in charge of the Kenefick Quigley Hoffman Construction Co.'s irrigation work near Cannon City, Colo.

L. J. Smith of the L. J. Smith Construction Co. returned from Arizona. Took a flying trip to St. Louis and returned home to spend a day on his farm near Pleasant Hill, Mo. Smith reports his work on the Santa Fe in

Arizona as getting along fine and dandy; also all of his ballasting on the Missouri Pacific in Kansas, Colorado, Oklahoma and Arkansas.

Hannon & Hickey have started on their steam shovel work on the Big Four R. R., at Mt. Carmel, Ill.

Within a few days Speaker Rombauer of the House of Delegates will present to the Municipal Assembly a bill authorizing the submission of a bond issue of $2,500,000 with which to complete the free bridge. It is likely that the measure will provide for a special election in October to prevent, Speaker Rombauer says, the defeat of the proposition through its failure to obtain a sufficient number of votes. If submitted at the general election in November, the proposal would have to receive a two-thirds majority of all the votes cast on that day. As several constitutional amendments are to be referred to the people in November, it is thought that a large number of voters might ignore the bond issue and cause its defeat. The sum which the people are to be asked to vote—$2,500,000—is a million more than was indicated as necessary by Mayor Kreismann in his latest message to the Municipal Assembly. In that communication he gave $1,500,000 as the amount needed to complete the free bridge for both railroad and vehicular traffic. In his message last May Mayor Kreismann declared that $3,000,000 would be required in finishing the bridge, but there has thus far been a saving of about $200,000 compared with the engineers estimates of cost. With $2,500,000 added to the original appropriations, the city would be able to build the bridge with main eastern and western approaches, and north and south turnouts on the wharf.

Wm. Heman, Secretary of the Heman Construction Co., fell from a Market St. car here last Saturday morning and died an hour later.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Virginia City, Mont., state that George F. Douglass, chief engineer of the Virginia City Southern Electric Ry. Co., has located the permanent line of the road to Alder and that Robert J. Watson of the Leber-Watson Engineering Co., which has the contract to construct the road, has arrived from Kenyon City, from which point on the Northern Pacific the same company is to build an electric road to Cook City, a distance of about sixty-five miles, and will be in active charge of the work at Virginia City. It is hoped to have grading started by May 1.

It is reported in Missoula that ex-Senator W. A. Clark, New York City, is to acquire the power plant and water works at Hamilton, and is also to construct an electric line from Missoula to Hamilton.

The Commercial Club of Belgrade has raised $30,000 and has $20,000 more promised, for the construction of an electric railway line from Belgrade to the Dry Creek and East Flathead country north of there. The money subscribed is for the purpose of encouraging the construction of the proposed electric line, the route for which has already been surveyed and most of the right-of-way secured by options. It is proposed to connect with the Bozeman-Three Forks line now in course of construction.

The Northwestern Improvement Co., a subsidiary corporation of the Northern Pacific Ry., operating coal mines in the vicinity of Red Lodge, has increased its capital stock from $3,000,000 to $7,000,000.

Engineers of the Northern Pacific Ry. have arrived in Belgrade where they will make their headquarters for the construction of the new low grade line between Logan and Bozeman. It is said that the new line will be four or five miles longer than the present one and will be used exclusively for eastbound freight. Construction work will begin at once, most of the right-of-way having been secured.

It is reported that the Northern Pacific branch up the east side of the Bitter River from Missoula is to be constructed this summer.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hicks-Johnson Construction Co., Long Island City, has work well under way on the constructing of the New York & North Shore Co.'s trolley extension from Flushing to Bayside. The company is to lay 3½ miles of track and is to have it laid and ready for use by the cars of the company on June 10.

The State Public Service Commission has taken under consideration the application of the Auburn & Syracuse and the Auburn & Northern companies for a rehearing on their joint petition to double track the State St. line in Auburn.

The state superintendent of public works has awarded Barge Canal Contract No. 90 to the D'Olier Engineering Co. of Philadelphia, Pa., for $178,197. This contract provides for furnishing and installing electrical equipment for lighting and operating locks on the Erie, Champlain and Oswego canals at Baldwinsville, Smith's Basin, Comstock's, Whitehall, Phœnix and Oswego. Another contract providing for the construction of a dike along the Oswego River for a mile and a quarter near Fulton was awarded to Cunningham & Woodard of Hudson Falls for $7,721.

The Battle Island Pulp Co. has purchased land to the south of the present Minetto dam at Oswego and has presented a proposition to the advisory board of engineers of the barge canal for the construction of a dam on the property acquired. The proposition as proposed by the Battle Island Pulp Co. provides that the high and Minetto dams be reconstructed with no change in the height of their crests and the raising of the lower, the first or lower dam in Oswego.

Lane Bros. Co., of Altavista, Va., who were recently awarded Barge Canal Contract No. 21, have opened offices in the Cutler Bldg., Rochester N. Y., and are planning to begin construction work May 1. Included in Contract No. 21, which extends from the west bank of the Genesee river about 2½ miles to the eastern limit of Contract No. 6, is some of the heaviest rock excavation on the line of the barge canal. At a point opposite Brooks avenue, Rochester, the bottom of the canal will be 62 ft. below the present surface. Besides the actual work of excavating the contract includes the construction of a guard-lock at the crossing of the Genesee river and the machinery for its operation, three bridges, with sub-structures and approaches, and the necessary highway changes and drains. It is proposed to use steam shovels largely in the excavating, the shovels, to be worked in succession, each machine working on a lower level than the preceding one. According to the tentative plans five of the shovels will be at work as soon as practicable. In addition, chamelers will be employed for rock cutting.

The Knight Construction Co., of Middletown, has been incorporated with a capital stock of $5,000 and purposes to engage in a general contracting business, including the building of roads, bridges, railroads, etc. The incorporators are: Samuel F. Knight, No. 14 Highland Ave., Lee M. Drake, No. 22 Roberts St.; Wm. E. Seymour, all of Middletown, N. Y.

The New York Central & Hudson River R. R. is said to be considering building a cut-off near Albany, similar to the one between Hoffman and Carman. In connection it is said that surveys and plans have been made for a new bridge over the Hudson River at New Baltimore.

The Bath Electric Light Co., of Bath, has applied to the State Public Service Commission for permission to issue $150,000 of bonds for extensions and improvements.

The State Public Service Commission will begin to hold hearings in New York City for the building of the new subways. The first hearing will be devoted to the form of contract for the construction, equipment and operation of the new lines. Further hearings will deal with the alternate form of contract whereby the city will build the subways section by section, spreading the cost over four or five years and then leasing out the operating right of the lines. The Board of Estimates and Apportionment of New York City has recently announced that it was ready to set aside for subway purposes $13,000,000 after July 1, 1910, and also the $47,000,000 which is hoped will be obtained as a result of the passing of the constitutional amendment at the last election authorizing the exemption of revenue producing bonds from computation in ascertaining the debt limit.

The Long Island R. R. has a large force of men at work in the vicinity of Springfield Junction, L. I., between the Laurelton and Rosedale stations. The tracks of the Montauk Division are being shifted so as to eliminate a bad curve there, and also to provide room for the laying of the additional track of the third rail line, which runs parallel to it at this junction point. When the work is finished the grade of the Montauk tracks will be about 3 feet higher than it is at present, and the distance between Laurelton and Rosedale will be considerably shortened. The raising of the tracks at the Laurelton station will be sufficient to allow for the depression of Cortland Boulevard, which passes through Laurelton and now crosses the track at grade, and will thus do away with one more bad crossing on the Long Island road.

The City & Suburban Ry. Co. of New York County has been incorporated with a capital stock of $230,000 and proposes to operate a street surface electric railway. The incorporators are: Wm. H. Burroughs, Louis J. Judgens, both of No. 74 Broadway, New York City; I. T. Flatto, No. 261 Broadway, New York City; Thomas F. Martin, 16 Court St., Brooklyn. The company has applied for a franchise to operate a railroad between Brooklyn and Amityville, and also to operate a spur from the Ridgewood Reservoir to Jamaica Bay.

The Brooklyn Rapid Transit Co. of Brooklyn, has applied to the Board of Estimates of New York City, for a franchise to operate a line over the Manhattan Bridge and through the Canal St. tunnel, Manhattan.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hocking & Sunday Creek Traction Co. has had surveys completed for the extension to Athens and within a short time contracts will be let for its construction. Engineers have now started on surveys in the upper Sunday Creek and on Sugar Creek. The company is now operating part of its line with gasoline cars. It is said that the company expects to build to Logan and will connect there with an extension of the Scioto Valley Traction Co., which would give traction connection from Columbus throughout the Hocking Valley mining region.

Norwood, a suburb of Cincinnati, has voted in favor of granting the Cincinnati Traction Co. an extension franchise of 25 years to operate in Main Ave. and a 25 year franchise to extend a line down Sherman Ave.

The Board of Trade of New Lexington is securing right of way for a proposed extension of the Southeastern Ohio Ry. from Crooksville to New Lexington.

Engineers of the Big Four have been in Kenton surveying routes for the short spur which is to be built at Kenton to connect the lines of the Big Four Ry. and the Toledo & Ohio Central R. R.

The state house of representatives has passed the Swan bill, providing for the elimination of railroad grade crossings outside of municipalities on the initiative of the county commissioners. Not more than one crossing a year is to be abolished in any county and three-fourths of the expense is to be borne by the railroad.

Lane Bros. Co., Altavista, Va., have begun work on its recently awarded contract for double tracking the 17-mile stretch of the Chesapeake & Ohio Ry. between Greenup and South Portsmouth. They also have the contract for double tracking between South Portsmouth and St. Paul, Ky.

The Kanawha & Michigan Ry., F. B. Sheldon, Chief Engineer, Columbus, O., is reported to have awarded the contracts for the

work of changing the grades and doing other new work on the Kanawha & Michigan at Kanauga, just across the river from Pt. Pleasant. Grades will be cut down and curves cut out by the new construction, which will cost about $100,000.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Extensive yard and track improvements in Oklahoma City, involving the expenditure of $400,000, are proposed by the Santa Fe and Frisco railways. The Santa Fe will build new yards south of the city to accommodate 2,000 additional cars. The Frisco will construct a system of terminals covering 80 acres northeast of the city.

The Commercial Club of Ardmore has been asked to co-operate in securing the building of the Red River Valley & Texas R. R. from Chillicothe, Tex., to Ardmore. F. L. Mercer, Frederick, Okla., is interested.

The Muskogee Transit Co. has been chartered with a capital stock and proposes to build a 225-mile electric interurban system through the counties of Muskogee, Wagoner, Tulsa, Creek, Okmulgee, McIntosh, Sequoyah and Cherokee. The system proposes to touch many towns in the territory including Muskogee, Corrette, Coweta, Broken Arrow, Tulsa, Sapulpa, Haskell, Boynton, Okmulgee, Checotah, Warner, Webber's Falls, Illinois Station, Braggs, Fort Gibson and Henryetta. Among the incorporators are: E. W. Mangson and Oliver J. Barwick of St. Louis, Mo.; Tams Bixby and T. P. Smith of Muskogee; O. D. Revell of Asheville, N. C.

The Anadarko Western Ry. Co. has been chartered with a capital stock of $50,000 and proposes to build a 50-mile line through Caddo County at a cost of $1,000,000. It is proposed to construct a line from near Alden through Anadarko to a point near the Caddo-Grady county line. The incorporators are C. H. Deford, G. D. Driskell, L. M. Swivey and W. F. McCracken, all of Anadarko, Okla.

The Oklahoma Electric Co. of Oklahoma City has brought proceedings to condemn a water power site on the Washita river near Ardmore. The company states an investment of $150,000 will create an 8,000 h.p. plant.

The Muskogee Electric Traction Co., of Muskogee, will soon begin the laying of a double track on the West Broadway line.

Smith Brothers, Memphis, Tenn., are reported to have been awarded the contract for the construction of the Joplin, Oklahoma & Western R. R., and it is said that construction work on the line between Joplin and Bartlesville will be started next month. F. O. Overlees, Bartlesville, Okla., is interested.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Portland has granted a franchise to the King's Heights Trust Co. to construct a street car line from 23d and Washington sts. to King's Heights, via the Barnes road.

The Portland, Eugene & Eastern Ry. is to build a 5-mile loop line at Eugene.

Advices from Marshfield quote officials of the new Coos Bay Rapid Transit Co. recently organized to build an electric line from Marshfield to North Bend, as stating that the work of building the road will begin as soon as the franchises in the two cities are granted.

The Oregon Electric Co. has applied to the city council of Albany for a franchise through that city. The company plans to extend its line from Salem to Albany and proposes to have construction work started sometime next month.

The Union Central R. R., now in operation between Union and Cone, has surveys under way for an extension.

The Eschbach-Bruce Co., Seattle, Wash., has been awarded the contract for completing the Furnish-Coe dam in Umatilla County, Oregon. The dam will cost about $110,000 and the concrete core has already been completed from bed rock to the surface of the ground. The dam will be 50 ft. high, 1,170 ft. across, 270 ft. wide at the base and 20 ft. wide at the top. It will form a reservoir covering 240 acres and containing 8,000 acre ft. of water.

The Corvallis & Eastern R. R. Co. has let a contract to the Yaquina Bay Lumber Co., for 7,500 ties for the 3½ mile extension of the railway from Yaquina, the present terminus, to Newport.

Advices from Vale state that the Oregon & Eastern R. R., a Harriman subsidiary company, on April 15 started active work of construction over its survey, which extends westward across Oregon to a juncture in Western Oregon with the Klamath-Natron line of the Southern Pacific Company at Odell.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pittsburg & Allegheny Valley Street Ry. Co., according to advices from Connellsville, will advertise for bids for the construction of the road from New Kensington to Leechburg about May 1.

Timothy Burke, Scranton, has started work on his contract for building the new 4-mile cut-off of the Delaware, Lackawanna & Western R. R., at Analomink, near Stroudsburg.

The directors of the Lehigh Valley R. R. Co. have adopted a resolution recommending to the stockholders that the capital stock be increased from $40,334,000 to $80,000,000. A meeting of the stockholders has been called for June 22 to act on this resolution. If the stockholders approve, the directors propose to issue $20,167,400 of new stock, giving stockholders the right to subscribe at par for the new issue. Six millions of 7 per cent outstanding bonds and other obligations will be paid out of the stock and the money remaining will be used for betterments.

Grading work is under way on a new railroad from Brownstown to Millway.

An ordinance has been before the city council of Scranton to permit the Scranton Ry. Co. to lay a single track line on Lafayette St., between Main and Bromley Aves.

The Philadelphia & Reading Ry., Wm. Hunter, Chief Engineer, Philadelphia, is reported to be planning to construct a heavy freight line of tracks paralleling its New York Division from a point south of Wayne Junction to beyond Logan.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Quanah, Seymour, Dublin & Rockport Ry. Co., mentioned in our last issue, has elected L. E. Walker, President; A. J. Elilers, Vice-President; Will L. Vining, Secretary; and H. Pfaefflin, Treasurer, all of Austin. Austin will be headquarters for the company. Engineers are already at work near Rockport and rails will soon be laid.

The Houston & Bay Shore Traction Co. has been formed by A. F. Irvin, Detroit, Mich., and it is stated in Houston that construction work will be started within the next 60 days on an interurban line between Houston and La Porte.

An amendment to the charter of the Stephenville, North & South Texas R. R., which was recently purchased by the Cotton Belt line and will be operated as a part of the Cotton Belt system, was filed on April 18. It provides for the construction of 83 miles of extensions. One is to run from Hamilton to Gatesville, 32 miles; another from Stephenville to Thurber, 26 miles, and another from Hamilton to Comanche, 35 miles. M. L. Lynch, Tyler, Tex., is chief engineer, Cotton Belt line.

Construction work is to be started shortly on the projected line on the Gulf Coast & Providence City R. R. The road is projected

The Galveston-Houston Interurban Ry Co., J. B. Townsend, engineer, 410 First National Bank bldg., Houston, has awarded a contract to the Peden Iron & Steel Co. of Houston for 350 miles of standard railroad barb wire fencing. Another large contract upon which bids will be received in a few days by the interurban company is the one covering about 120,000 cu. yds. of shell for ballasting. This contract will mean that about 50 miles of the right of way will be ballasted.

Crow Bros., civil engineers, Waco, Tex., are promoting a project for the construction of an interurban line from Hillsboro to Whitney, a distance of 10 miles.

from Glen Flora and Pierce City, Tex., with its western terminus at Provident City, a new town of 1,000 inhabitants. The contract for 60 miles of road has been let to C. L. Dwyer, Houston. Schlafli & Porter, Houston, Tex., are the engineers.

W. F. Barbour & Sons, who have the contract for building the first four miles of the Santa Fe east from Brady, Tex., have begun the grading work.

In connection with the construction of the Elephant Butte dam in New Mexico by the U. S. Reclamation Service, it will be necessary to build a 12-mile railroad from the dam site toward Engle on the Santa Fe to be used for hauling construction materials. Plans for this railroad have been prepared at the Reclamation office in El Paso. W. M. Reed, El Paso, is district engineer.

The Chicago, Rock Island & Pacific Ry. is to make a survey from Mangum, Okla., to Quanah, Tex., for the purpose of determining a line from the former point to Quanah. It is stated that the action of the Quanah, Acme & Pacific Ry. Co. in authorizing immediate extension of that line to Roswell and El Paso will cause the building of the Rock Island to Quanah in order that the latter road may shorten the distance to El Paso by use of the tracks of the former.

The Canadian Government has purchased the dredge, the Nereus, now at work in Galveston, and it is to be delivered in Halifax, N. S. The dredge was one of three that were built in Holland just prior to the Galveston tidal wave. Owing to the necessity of getting immediate help in rebuilding the city, the dredges were brought to America. The other two have been sold and the delivery to the Canadian Government of the Nereus takes away the last of them.

The Bartlett & Florence Ry., J. R. Graham, Chief Engineer, Bartlett, is reported to have completed financial arrangements for extending the line through to Lampasas, also to a point near Houston crossing the San Antonio & Aransas Pass, International & Great Northern and Houston & Texas Central on an air line to Brenham.

C. M. McConnico and J. S. Moore, of Lufkin, have been awarded the contract for the grading of the Temple & Northwestern railroad from Temple to Hamilton. It is proposed to complete the work in twelve months.

The grade of the Altus, Roswell & El Paso R. R. has been practically finished for 165 miles, from Altus, Okla., to Lubbock, Tex., via Hollis, Okla., and Wellington, Memphis, Lakeview, Silverton, Lockney and Petersburg, Texas. The iron on this road is now being laid out of Altus toward Wellington at a rapid rate. Work proceeds on the grade at unfinished places near Memphis, Silverton and Lakeview.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Salt Lake County Commissioners have granted a franchise in favor of Le Grand Young, Salt Lake City, for the construction of an interurban road from Salt Lake City to Holliday. The road will run along 21st East St. from the southern limits of the city to 13th South St. thence east along that street to 28th East St., at Salt Lake City, thence south on that street to Holliday. Work must begin on the road within one year and be completed and in operation within two years.

The Oregon Short Line Ry. has engineers in the Cache Valley making surveys for the improvement and reconstruction of the Cache valley branch of that road. The engineers will run new lines where necessary, and will eliminate, as far as possible, the heavy

grades that are encountered on the present line. The original Cache valley line was constructed under the direction of Brigham Young, and was known as the Utah Central. The line has many heavy grades and curves. These grades will be overcome wherever possible, and the new line will eliminate many curves.

A company has been organized and has had surveys made for the construction of a reservoir on La Sal creek, at Rattlesnake Flat. The purpose is to build a large reservoir about 30 miles above Moab and store the water during the winter months, which will irrigate 20,000 acres of land. The dam will be about 75 ft. high. J. M. Cunningham, La Sal, Utah, and D. M. Cooper, Moab, are interested.

The reconstruction work on the 15 mile stretch of washed-out Salt Lake track between Guelph and Galt was completed April 19. This was the most difficult portion of the engineer's task. The stretch completed makes 32 miles of road rebuilt to date through the washed-out sections in Nevada and Utah. There remains about 64 miles to be reconstructed, but material is on hand and the work will be finished rapidly.

The Gunnison Valley Power Co., of Gunnison, has been incorporated with a capital stock of $50,000, the officers being as follows: M. D. Beauregard is president; S. M. Duggins, vice president and treasurer; L. W. Ransh, secretary.

Los Angeles capitalists are planning to expend $75,000 in rebuilding a mountain resort in the Wasatch Mountains east of Ogden. The plans include the construction of a cog railroad up the side of the mountain. Alexander Thorpe, Los Angeles, Cal., is interested.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Efforts are being made by citizens of Chesterfield county to have the Virginia Railway & Power Co. of Manchester extend its street railway from the Cockade City to Matoaca. Most of the owners of land along the proposed line have agreed, it is said, to give a free right of way for the road.

J. P. Pettyjohn & Son, Lynchburg, Va., have been awarded the contract to build the repair shop and roundhouse for the Virginian at Victoria.

The Holston River R. R., a new line of the Southern Railway system, extending from Bullsgap, Tenn., to Moccasin Gap, Va., was completed on April 15. This line gives the Southern a direct entrance into the coal deposits of Southwest Virginia.

The town of Bedford City has sold $100,000 of bonds recently voted for an hydroelectric plant. The town purchased a water power site on the James River and 4,500 acres of mountain land for $32,500, and it is to develop this power plant that the bonds were issued. W. R. Abbott, Bedford City, is interested.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Felt & Eastman, Tacoma, have been awarded the contract for constructing a portion of the projected line of the Seattle-Tacoma Short Line Ry., which proposes an interurban line between Seattle and Tacoma. Work is to be started by May 15.

The Bellingham Eastern Logging & Railway Co. of Bellingham, has been incorporated and will build a new railroad for common carrier purposes. The terminal point of the road has not yet been determined. The road will be used principally in marketing timber. Thomas Waters and D. J. Cain, Bellingham, are interested.

The Mary Hill & Goldendale Ry. Co., with a capital stock of $10,000, has been incorporated and proposes to build a railroad between the points named. The incorporators are Samuel Hill and A. E. Hanford.

Location work for the Ellensburg-Ritzville cut-off of the Northern Pacific Ry. has been about completed. The route from the Columbia River to the top of the Columbia-Yakima River divide has practically been settled upon and the engineer's attention is now confined to the most feasible route from the divide to the present main line. It is said that the Northern Pacific engineers have succeeded in gaining the same maximum grade on both sides of the Columbia River divide as did the Milwaukee engineers.

The Northern Pacific Ry. is reported to be planning to let contracts shortly for the construction of the 4-track line around the Old Town waterfront by way of the Narrows and Nisqually flats to the connection with the main line at Tenino, a distance of about 40 miles.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Foley, Welch & Stewart, St. Paul, Minn., have started work on their contract for constructing the new ore dock at St. Louis Bay, Superior, for the Soo Ry. The contract amounts to about $200,000. The ore dock is to be about 500 ft. long and will have a timber approach bringing the total length of the entire structure up to nearly 6,000 ft.

The Milwaukee Electric Railway & Light Co. will lay over 5,000 tons of new steel rails in Milwaukee this year. It will also lay 1,000,000 new granite blocks this year, direct from Wisconsin quarries.

B. W. Hicks, of Warren, Ill., has a subcontract for grading work on the Chicago & Northwestrn Ry. at Templeton, Wis.

The Chicago, Milwaukee & St. Paul Ry. is reported to be contemplating securing a new route from Milwaukee to Kansas City for a fast freight line. Such a line could be obtained by the construction of about 50 miles of track between Shullsburg, Wis., and Farley, Ia. When this is done the line will extend from Milwaukee to Janesville, thence to Shullsburg, Dubuque, Ia., Cedar Rapids, Ottumwa and Kansas City. The new line, if built, would have an approximate mileage of 540 miles. From Kansas City to Milwaukee via Chicago, the mileage is 583.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Canadian Pacific Ry. has appropriated $250,000 for spreading selected gravel and broken stone over the grade in order to reduce the amount of flying dust on the line between Fort William and Winnipeg.

The meeting of the stockholders of the Lake Superior Corporation will be held in Camden, N. J., May 6, to vote on a proposition to issue securities of the Algoma Central Ry. Co., a subsidiary of the Lake Superior Corporation, to the amount of about $3,500,000, to finance the completion of the railroad to a connection with the main line of the Canadian Pacific. It is planned to complete the Algoma & Central Railroad from Sault Ste. Marie to Josephine Junction and thence to Hobon, where it will connect with the Canadian Pacific. The greater part of the line along the extension proposed has already been graded. C. N. Coburn, Sault Ste. Marie, Ont., is chief engineer.

The Montreal Harbor Commissioners, F. W. W. Cowie, engineer, Montreal, are planning extensive development work in the harbor, which will involve the expenditure of from $12,000,000 to $18,000,000 in the next 12 years. The program for the present year includes the following: Grain elevator, No. 2. Capacity about 2,000,000 bus. Foundations to be permanent on reinforced concrete piles to rock. To be completed, ready for operating October, 1911. Appropriation for 1910, $800,000. High level railway tracks from the high level wharves above Victoria pier, up to Hochelaga, and Molson's Creek, available for winter and summer use. Three tracks and all crossings down as far as Hochelaga to be by subways. Appropriation for 1910, $200,000. New Victoria Pier and market basin. The upstream and outside wharves to be high level for ocean vessels, and all the inside to be low level for river craft, giving 2,700 lin. ft. of wharves having 35 ft. at low water for ocean vessels and 4,000 lin. ft. for river vessels. Appropriation for 1910 for 600 ft. of high level wharf and 800 ft. permanent low level, and other works, $400,000. The completion of the Dominion Coal Co. wharf at Hochelaga, length 291 ft. Appropriation for 1910, $100,000.

The Canadian Pacific Ry. has awarded the contract for the McPhillips St. subway at Winnipeg to John Gunn & Son, Winnipeg. The contract involves an expenditure of about $75,000 and calls for completion about July 15. The work will require the excavation of about 35,000 cu. yds. of earth and will need some 6,000 cu. yds. of concrete.

The Grand Trunk Pacific Ry. is planning to lay some 200 miles of steel this year on branch lines in the three prairie provinces. The contractors having grading contracts on this road in these provinces are as follows: 30 miles from Yorkton, on the Yorkton-Melville branch, Rigby, Hyland & Plummer, Winnipeg; from Watrous to Prince Albert, 130 miles, to J. D. McArthur & Co.; from Biggar to Battleford, 50 miles, the Goulin Contracting Co.; from Balcarres to Regina, the balance of the Melville-Regina branch, 75 miles, to J. D. McArthur & Co., and for 100 miles from Regina, south towards the boundary, with a view to swinging around later to Brandon, also to J. D. McArthur & Co.

Announcement has been made at Montreal that the Canadian Pacific Ry. will proceed at once with the construction of an air line between Mimico and Islington. By means of this cut-off the company will be able to get connections between Hamilton and the east without having to run over the Grand Trunk tracks along the waterfront in Toronto. It is also stated that the company will shortly build a line of its own from Toronto to Hamilton. In addition to this the work of double-tracking the line to Toronto, now partly carried out, is to be pushed ahead.

The Senate Committee on Railways has passed the Hamilton, Waterloo & Guelph Ry. bill, and the Toronto Eastern Ry. bill.

Supplemental estimates for the current fiscal year have been before the Canadian Parliament. The principal items in the supplemental estimates are as follows: To begin the construction of the Hudson Bay Railway, $500,000; further amount required for the construction of the Quebec Bridge, $500,000; surveys and borings for the proposed new or enlarged Welland Canal, $25,000; Port Colborne harbor improvements, $113,000; Port Arthur and Fort William harbor improvements, $100,000; Quebec harbor improvements, $100,000; Victoria harbor, B. C., $90,000. The main estimates of the Canadian Government for the fiscal year amount to $127,670,993.

The Canadian Northern R. R., M. H. MacLeod, General Manager, Winnipeg, Man., is said to be preparing to award a contract for the first 20 miles of its line on Vancouver Island. The Canadian Northern is now revising the survey made by the Barclay Sound Ry. Co., the charter of which the Canadian Northern took over. Within two weeks a contract will be awarded for the clearing of Canadian Northern townsite at Port Mann, and it is expected that construction will be commenced on its mainland line from New Westminster, B. C., about June 1.

City Engineer Rust, of Toronto, has recommended that the city officials apply to the Ontario Railway Board to compel the Toronto Street Ry. Co. to construct several new lines in Toronto. The city's share of the cost of the new railway lines will be $1,170,000. The city must pay for the substructure and necessary street widenings. The company's share would be only $500,000.

The Hudson Bay & Pacific Ry. Co. has sent out a second engineering party from Prince Albert, Sask. All the work so far has been done on the north side of the Saskatchewan and the indications are that the parties will survey direct from Prince Albert to Fort Churchill, and that the line will not go through The Pas, as had been reported formerly.

The Railway Committee of the Canadian Senate has reported the bill for the incorporation of the St. Lawrence & Ungava Ry. The company is given authority to build from the

St. Lawrence through Joliette, Berthier, Maskonge, St. Maurice and Champlain, to Ungava Bay.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the Southern Pacific R. R. of Mexico who are now locating the route of that road through the barrancas of the Sierra Madres between Orendain and Tepic, are said to have estimated it will cost not less than $8,000,000 to build one stretch of 20 miles of the road, owing to the fact that the line for the whole 20 miles will have to be one series of bridges and tunnels. L. H. Long, Tucson, Ariz., is chief engineer.

A commission representing the municipal government of the port of Veracruz has been in the City of Mexico for the purpose of arranging a loan for the introduction of a great water supply for their city. The commission wishes to contract a loan of $2,000,000 for the expense of the work.

Advices from the City of Mexico state that Edward L. Doheny, Charles L. Canfield, Lyman Stewart and other prominent California oil operators are projecting the formation of a $25,000,000 company to build a pipe line to carry California oil from the fields to points in Arizona and Sonora which are at present large consumers of California fuel oil. It is stated that the terminus of the pipe line will be at Cananea, in the state of Sonora where, by special concession, the Cananea Copper Co. has the right to import foreign fuel oil without the payment of any duty. The present consumption at the points to be reached by the pipe line, it is estimated, will exceed 300,000 bbls. per month.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Until noon, May 14, by Bureau of Navigation, Navy Department, Washington, D. C., for the construction of a concrete arch bridge at North Chicago, Ill.

Wilmington, Del.—Until noon, May 3, by Levee Court, for the erection of a reinforced concrete girder bridge at Noxentown Mill Dam, St. Georges Hundred, Delaware. James Wilson is County Engineer.

Evansville, Ind.—Sewers—John W. Newman, for the construction of sewers in this city, one on Fourth Ave. and the other through blocks 49 and 50, in Lamasco.

Centerville, Ia.—Sewer—Guy F. Smith, Indianola, at $3,021, for putting in 3,747 ft. of sewer in this city.

Hamburg, Ia.—Sewer—Dunnegan & Corey, Shenandoah, at $8,911, for the construction of the sewage system in this city.

Jamestown, Kan.—Waterworks and Lighting Plant.—Lund & Cunyon, Blackwell, Okla., at $15,000, for the construction of the waterworks and lighting plant in this city.

Junction City, Kan.—Waterworks—John Dalton & Sons, this city, for the construction of the new pumping plant at Fort Riley. W. W. Cook & Son, this city for the construction of the waterworks system.

Russell, Kan.—Dam.—Henry Bowman, Lawrence, Kan., at $17,176, for the construction of a reinforced concrete dam in connection with the waterworks.

Nashville, Tenn.—Sewers—Board of Public Works has awarded the following contracts: Quinn & Ellis, $281, sewer in alley 307, between Joseph St. and North Second St.; T. I. Curtis & Son, $895, sewers in alleys 612 and 611, between 12th Ave. and Quarry St.

Park R. Station, P. O. (Knoxville), Tenn.—Sewer—J. A. Ahler Plumbing Co., Knoxville, Tenn., at about $2,000, for the construction of a line of sewers on Washington Ave., 5,000 ft. in length.

Orange, Va.—Waterworks.—J. T. McMahon, Norfolk, Va., at $25,073, for the installation of a waterworks for this city. The work includes 100,000 gal. stand pipe, pipe line, all necessary to make a complete and perfect waterworks. April 22.

Saskatoon, Sask.—Excavating and Pipelaying.—Saskatoon Construction & Engineering Co., at $64,485, for three sections of the contract for furnishing necessary labor and material for laying water mains and sewer pipes and furnishing materials included. William Cooke, at $27,330, for one section of the above work. Bids were opened April 11.

EXCAVATION, MISCELLANEOUS, MATERIALS.

Oakland, Cal.—Cable.—The Waterbury Co., 45 California St., San Francisco, Cal., at $13,400, for furnishing the city with lead encased saturated core cable. Bids were opened April 13.

Troy, Kan.—Light & Power—Atchison Electric Light & Power Co., Atchison, Kan., at $25 per day, for supplying this city with light and power. City will build its own distributing line at a cost of $16,000.

Pittsfield, Mass.—Concrete Piles.—George W. Van Vranken, of the Raymond Concrete Pile Co. New York and Chicago, for the placing of Raymond concrete piles in the foundations of an addition to the power station of the Stanley Electric Co., this city. M. Thrane is Superintendent of Building and Construction.

Baltimore, Md.—Station—J. Henry Miller Co., Inc., this city, for the construction of the new Union Station of the Pennsylvania Railroad, on North Charles St. The station will be 277 ft. long and 63 ft. wide, with four stories, including the train platform. It is estimated that the building will cost $700,000.

Detroit, Mich.—Lumber.—Bids were opened April 14 by Col. C. McD. Townsend, U. S. Engineer, for furnishing and delivering at St. Mary's Falls Canal, Mich., about 2,630,000 ft. B. M. of timber, the following bids being recommended for acceptance. Lot II, White Star Lumber Co., Elma, Wash., 985,728 ft. B. M. of fir timber, at $11.25 per M. f. o. b. cars, Pacific Coast; Lot III, Emery D. Weimer, Ludington, Mich., 1,637,600 ft. B. M. Hemlock, at $18.94 per M. f. o. b. cars, Sault Ste. Marie, Mich. The other bids received, the prices being per M ft. B. M., were as follows: John Schroeder Lumber Co., Milwaukee, Wis., Lot III, $19.00; G. Elias & Bro., Buffalo, N. Y., Lot I, $12.50, Lot II, $12.50, Lot III, $19.00; Foster Lumber Co., Tacoma, Wash., Lot I, $11.75, Lot II, $11.40; G. W. Gates & Co., Portland, Ore., Lot I, $11.90, Lot II, $11.40; J. G. Newgegin, Tacoma, Wash., Lot I, $11.90, Lot II, $11.45; The Herron Co., Seattle, Wash., Lot I, $11.94, Lot 11, $11.94; Schwager & Nettleton, Seattle, Wash., Lot I, $12.15, Lot II, $11.99; R. J. Clark, Sault Ste. Marie, Mich., Lot. I, $13.25, Lot. II, $12.90, Lot III, $19.90; Day Lumber Co., Big Lake, Wash., Lot II, $12.00; J. R. Somerville, Napvine, Wash., Lot I, $12.40, Lot II, $12.25; James F. Abbot Co., Boston, Mass., Lot I, $12.40, Lot II $12.30; H. P. Waite Lumber Co., Minneapolis, Minn., Lot I, $12.50, Lot II, $12.50; Emery D. Weimer, Ludington, Mich.; Lot I, $12.95; Lot II, $12.94; McCormick Lumber Co., McCormick, Wash., Lot 1, 32 ft. and under, $12.00, Lot I, 34 and 36 ft., $14.00; C. M. McCoy, Minneapolis, Minn., Lot 1, $12.25; Lumber Manufacturers' Agency, Centralia, Wash., Lot. I, $12.35; Mercantile Lumber & Supply Co., Kansas City, Mo., Lot I, $13.88, Lot II, $13.50; Deatherage Lumber Co., Kansas City, Mo., Lot I, $14.40, Lot II, $14.40, Lot III, $37.50; Phillips & Seeley, Saginaw, Mich., Yellow pine, $25.00; Herzfeld Lumber Co., Alexander City, Ala., Lot III, Yellow pine, $28.50; Watkins-Gray Lumber Co., Hattiesburg, Miss., Lot III, $30.62; Rich Lbr. Mfg. Co., Hattiesburg, Miss., all yellow pine, Lot I, $35.97, Lot II, $34.34, Lot III, $32.92.

Pontiac, Mich.—Reservoir—A. J. Johnson, for the construction of a 2,000,000-gal. reservoir for the city water supply.

Brooklyn, N. Y.—Paints and Oils.—C. W. Keenan, Jay and Fulton Sts., city, for furnishing paints and oils to the Bureau of Sewers.

Brooklyn, N. Y.—Warehouse. — Turner Construction Co., 11 Broadway, New York City, for the erection of a 12-story reinforced concrete warehouse 175 ft. by 110 ft. for the Robert Gair Co., Washington St., city. William Higginson, Architect.

South Brooklyn, N. Y.—Factories. — Turner Construction Co., 11 Broadway, New York City, for constructing of Model Factories 5 and 6 for the Bush Terminal Co., this city. The buildings are to be reinforced concrete throughout and are each 700 ft. by 75 ft., six stories high, and have a connecting wing 250 ft. by 100 ft. six

stories high. Total floor area is 18 acres. William Higginson, Architect.

Boston, Mass.—Surfacing Dam. — Bids were opened April 4 by the Charles River Basin Commission for resurfacing the main portion of the Charles River Dam, the bids received being as follows: (1) standing for Coleman Bros., Boston, Mass. (awarded contract); (2) for F. D. Davis Co., Boston; (3) for Luke D. Mullen, Charlestown, Mass.; (4) for W. H. Ellis, Boston, Mass.; (5) for T. H. Gill Co., Boston, Mass.; (6) for John J. Falvey, Somerville, Mass.; (7) for McCarthy & Walsh, East Boston, Mass., and (8) for Wm. L. Miller, Boston.

BIDS RECEIVED AT BOSTON, MASS., APRIL 4, FOR RESURFACING MAIN PORTION OF CHARLES RIVER DAM.

Cleveland, O.—Wire.—John A. Roebling Sons Co., Trenton, N. J., at $1.152, for furnishing and delivering f. o. b. Cleveland, 7,000 lbs. No. 12 triple braid hard drawn copper wire for the police signal system. April 14.

Hamilton, O.—Repairing Rail. — Oregonia Bridge Co., Lebanon, O., at $710, for repairs to rail of High and Main St. bridges. The work includes new 3-in. pipe for top of rail and ¼x 5-in. plate and two angles for lower part of rail. Bids were opened April 16.

Youngstown, O.—Water Pipe.—J. B. Clow & Sons, Chicago, Ill., at $25.15 per ton, for furnishing 515 tons of water pipe and specials. Bids were opened March 28.

Fort Sill, Okla.—Electric Light and Power Plant.—Following are the low bids received on electric light and power plant, electric lighting system, etc. Bids opened by David L. Stone, Constructing Quartermaster: Kraushaar Brass Mfg. Co., St. Louis, Mo., $7,780; McCay Engineering Co., Baltimore, Md., $10,997; General Electric Co. of Texas, Oklahoma City, $2,632; Ridgway Dynamo & Engine Co., Ridgway, Pa., $13,400; Westinghouse Elec. & Mfg. Co., Baltimore, Md., $3,863; E. C. D'Yarmett, Oklahoma City, Okla., $16,700; Urbauer-Atwood Heating Co., St. Louis, Mo., $2,450; Urbauer-Atwood Heating Co., St. Louis, Mo., $6,500; Evans, Almirall & Co., New York City, $1,754; Evans, Almirall & Co., New York City, $2,647.

Aberdeen, S. D.—Cement—McCaull-Webster Co., at $1.65 per barrel, for furnishing the city with 500 barrels of cement.

Milwaukee, Wis.—Repairing Crib.—W. H. Gillen, 902 Summit Ave., city, at $6,690, for repairing crib located in Lake Michigan, about 3,200 ft. east of the North Point Pumping Station. Bids were opened April 22.

Toronto, Ont.—Pipe—Following contracts have been awarded for furnishing cast iron pipe: National Iron Works, at $4.35 per length for 3-in. pipe; at $4.88 per length for 4-in. pipe; at $6.97 per length for 6-in. pipe; Canada Foundry Co., at $10.50 per length for 8-in. pipe; at $14.80 per length for 10-in. pipe; at $19.85 per length for 12-in. pipe.

Prince Albert, Sask.—Cement.—O. B. Manville, city, at $293, for furnishing the city with about 2,500 bbls. of cement for the year 1910. Bids were opened April 18.

Saskatoon, Sask.—Stand Pipe. — Western Bridge & Equipment Co., Chatham, Ont., at $6,478, for furnishing and erecting a steel stand pipe. Bids were opened April 4.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Little Rock, Ark.—Plans for the proposed viaduct over the railroad crossing at 19th St. Pike were submitted to Joseph Asher, County Judge, by E. F. Mitchell, Engineer of Construction of the Iron Mountain R. R., and T. W. Fatherson, District Engineer of the Chicago, Rock Island & Pacific Ry. Work will begin in a very short time as the structure, according to the act passed at the last legislature, must be finished by Sept. 10, 1910.

Eureka, Cal.—County Commissioners have decided upon the construction of the proposed bridge over the Eel River at Ferndale and surveys are now being made and plans and specifications are being prepared.

Nevada City, Cal.—Board of County Supervisors and E. M. Miller, County Engineer, are taking up the matter of constructing a new bridge across the Truckee River with a span of 150 ft.

Sacramento, Cal.—Commissioners of Yolo and Sacramento Counties have passed separate resolutions and at a meeting in the near future will pass a joint resolution providing for a change in the present plans of the proposed Southern Pacific R. R. bridge across the Sacramento River at this place from draw to lift bridge type. The change as proposed is satisfactory to the railroad company.

Atlanta, Ga.—Committee of citizens are to confer with General Manager T. K. Scott of the Georgia R. R. at Augusta, Ga., regarding the construction of a bridge across its tracks at Jackson St., and an underpass at Whiteford Ave.

Cedar Rapids, Ia.—City Council has on file two sets of plans for the construction of the proposed reinforced concrete bridge across the river. As proposed the structure will consist of six 96-ft. spans resting on four piers and four abutments, the island dividing the bridge in two parts. The roadway will be 48 ft. in width and an 8-ft. sidewalk will be built on each side.

Des Moines, Ia.—Plans for the proposed Walnut St. bridge over the Des Moines River, calling for an ornamental concrete structure, were presented the council by City Engineer John W. Budd and referred to the Department of Streets.

Buhl, Idaho.—Capt. R. A. Hazzard, President of the Clear Lake Orchard Co., has decided upon the construction of two steel bridges across the Snake River about 4 miles north of this city.

Idaho Falls, Idaho.—The Oregon Short Line Ry. Co., in connection with improvements planned in this city, will construct a large bridge over the Snake River.

Chicago, Ill.—Hearings are to be held May 10 and 20 at the office of Maj. Thomas H. Rees, U. S. Engineer, 508 Federal Bldg., on the Jackson Blvd. and Metropolitan West Side Elevated Railway bridges, respectively. The structures are declared obstructions to navigation.

Colona, Ill.—According to advices from this city the proposition to construct a bridge has not been fully decided upon. Martin Coleman is village clerk.

Decatur, Ill.—According to reports the Wabash R. R. Co. has authorized the expenditure of about $50,000 for the construction of new bridges, ten being on the Bement-Tilton Line for single track; five between Bement and Tilton; two between Decatur and Edwardsville Junction. One structure over Mud Creek will be 160 ft. in length and is estimated to cost $10,000.

Fulton, Ill.—The completion of the Chicago & Northwestern R. R. Company's Fulton Cutoff will require the construction of a number of steel and concrete bridges. Temporary structures are now serving at the various points.

Fort Wayne, Ind.—Park Commissioners have asked the city council for an appropriation of $1,500 for repairing the floors of the foot bridges at Swinney Park and Lawton Park.

Rockville, Ind.—The wagon bridge across the Big Raccoon River was recently dynamited and destroyed by the fire which followed the explosion. The reconstruction of the bridge will require an expenditure of about $10,000 by the county.

Winfield, Kan.—Joint committee of Winfield and Arkansas City, Kan., decided at a recent meeting held at Arkansas City, to petition the Cowley County Commissioners to vote bonds amounting to the sum of $100,000 for the construction of concrete bridges.

Shreveport, La.—Bids received by the city council for the construction of the proposed Red River wagon bridge connecting the cities of Shreveport and Bossier, indicate the building of the proposed structure will necessitate an expenditure of $300,000 or more.

Winnfield, La.—The Winn Parish Police Jury has appropriated $2,500 for the erection of a steel bridge across Dudgemonia Bayou at Maxwell's Crossing.

Calumet, Mich.—Chairman of the bridge committee has taken up the matter with the Houghton County Traction Co. and the Copper Range R. R. Co. of repairing the county bridge.

Cheboygan, Mich.—Officials of the Detroit & Mackinac Ry. Co. have secured permission from the United States War Department to construct a bridge over the Cheboygan River north of the paper mill and construction work will be started soon, provided the city council will permit the crossing of Main St. with the proposed track. H. S. Waterman, East Tawas, Mich., is chief engineer of the railroad.

Grand Rapids, Mich.—City council has finally decided in favor of the improvement of the approach to the Ann St. Bridge. The work including the improvement of Victoria St. will necessitate an expenditure of $15,000.

Wadena, Minn.—Township Board of Huntersville has applied to the County Commissioners for assistance in erecting the proposed bridge across the Crow Wing River. The work as proposed is estimated to cost $5,000.

Missoula, Mont.—The proposed bridge of the Chicago, Milwaukee & Puget Sound Ry. Co. across Rattlesnake Creek at the east end of the Missoula yards will be constructed of sufficient width to lay three tracks.

Omaha, Neb.—Commissioners of Douglas and Saunders counties have ordered plans prepared for the construction of a bridge across the Platte River at Valley and bids for the construction work will be asked soon.

Jersey City, N. J.—The Street and Water Board at the last meeting passed a resolution applying to the Finance Board for funds for the repairs of the Mercer and 13th St. viaducts. The amount required for the necessary work is estimated to be $9,250.

Albany, N. Y.—Martin G. Saxe, representing the New York and New Jersey Interstate Bridge Commission, with representatives of commercial bodies in the borough of Bronx, have appeared before the Senate finance committee favoring the bill authorizing the commission to make borings for the proposed bridge over the Hudson River at 179th St. to the Jersey shore.

Albany, N. Y.—The New York Central R. R. Co. has surveys under way in the vicinity of North Pearl and Van Woert Sts. for the erection of a viaduct over the railroad.

Albany, N. Y.—The New York State Barge Canal Terminal Commission has passed a resolution requiring the construction of bascule or movable bridges across the canal at Tonawanda, thus effecting about six existing bridges, and the estimated cost of replacement will range from $500,000 to $750,000.

Conklin, N. Y.—According to advices from this place work has been started tearing down the old Kirkwood-Conklin bridge over the Susquehanna River and steps will soon be taken by the cities toward the construction of a new bridge to replace the old.

Fenton, N. Y.—City is soon to vote on proposition of borrowing $9,500 for the construction of a bridge over the Chenango River at Chenango Bridge.

New York, N. Y.—Plans for the proposed approaches to the Manhattan bridge at the intersection of Canal St. and the Bowery have been approved by the Municipal Art Commission. The work as proposed will involve an expenditure of about $700,000.

Syracuse, N. Y.—Board of Contract and Supply have received the following bids for the construction of a reinforced concrete arched bridge over Onondaga Creek at Dickerson St.: Samuel Bonn, $6,560.75; C. J. Sullivan, $8,055.25; Frank Sposata, $9,451; C. T. Hookway, $7,111.40; H. S. Moore, $10,999.70; John Young, $7,886.50; Walter Bradley, $8,280.50; Wells, Boughton & Co., $9,299.80.

Statesville, N. C.—According to reports from this place the Southern Ry. Company is planning the construction of a modern steel structure across Third Creek to take the place of the old wooden Kestler bridge two miles south of this city on the Charlotte and Taylorville Road. W. H. Wells, Washington, D. C., is chief engineer of construction of the Southern Ry.

Grand Forks, N. Dak.—Bridge committee of the County Commissioners are to investigate conditions at places where the construction of bridges have been petitioned for.

Sandusky, O.—Commissioners of Erie county are seeking advice from T. J. Loeffler concerning the plans and specifications for the construction of the bridge over the Huron River at Huron. Mr. Loeffler is bridge engineer of the Lake Shore & Michigan Southern Ry. Company.

Wooster, O.—County Commissioners have rejected all bids received for placing a new roadway in the bridge over Apple Creek.

Pryor Creek, Okla. An election is soon to be held to vote on issuing bonds amounting to $100,000 for the purpose of constructing bridges on the Grand River and other smaller streams.

Allentown, Pa.—County Commissioners have filed petitions with the grand jury for the construction of three bridges at Wanamaker's, Jacksonville and Ruchsville.

Beaver, Pa.—County Commissioners are planning an expenditure of about $8,000 for the improvement of the Ohio River bridge between Rochester and Monaca. The work will include the replacement of nearly an entire span.

Dunmore, Pa., Scranton, Pa.—Residents of Dunmore and City Improvement Association are petitioning the Erie R. R. Co. to construct the proposed new bridge on Monroe Ave., Dunmore, to conform with the width of the street at that point.

Johnstown, Pa.—Surveys have been made for the proposed bridge connecting Cambria City and Minersville by the Fetterman Engineering Co. Petitions are now being circulated among the citizens in order to secure the interest of the city councils and the County Commissioners.

Two Popular Arguments in Favor of Day Labor Work and What They Amount To.

Of the various claims that have been urged in its favor by the exponents of the day labor system of doing construction work, there are two which are just now popular. The first is the difficulty of drawing contracts to cover unknown conditions and the second is the flexibility of the day labor system in allowing changes in plans, etc. Just to how much does either of these claims amount? If we may believe the advocates of the day labor system they amount to enough to warrant day labor construction in very many instances. Neglecting all other phases of the case between the day labor and the contract systems of doing construction work let us consider these two.

Stated briefly, the propositions we have to consider are: First, it is exceedingly difficult to draw contracts which will cover the multitude of unforeseen obstacles and contingencies to be met on certain classes of work. Second, plans can be modified or even radically changed after work is begun if the work is being done by day labor while a similar procedure under contract work is, customarily, expensive and difficult. If this is a fair presentation then these two statements are tantamount to saying either that engineers are not capable of determining and predicting the conditions of work with any degre of confidence, or that engineering and legal acumen are insufficient to devise contract requirements for meeting undetermined conditions or that the engineer has not given the work careful and competent investigation and must supply the deficiency by leaving the way open for changes in plan to meet the conditions as they become known, or that contractors as a class are not open to fair business propositions. To which of these alternatives do engineers wish to subscribe?

How frequently do we meet with indeterminate conditions in planning construction work? Undetermined conditions are common enough and occasionally without doubt circumstances arise which involve so much uncertainty as to conditions under which work is to be prosecuted as to make it difficult to prepare satisfactory specifications to cover them; but such occasions are rare. Take, for example, underground work, which as a class is commonly admitted to be particularly subject to uncertainties, how often has it been found impracticable to cover it satisfactorily by contracts and specifications. The Boston and New York subways, the Pennsylvania and other railway tunnels under the Hudson and East rivers, the water supply tunnels of the Metropolitan Water and Sewerage Board at Boston and the Catskill aqueduct work at New York were all constructed by contract and no unsurmountable difficulty was found in drawing satisfactory agreements and specifications. Other examples can be cited by scores of work quite as complex if one needs them. The truth is that we do not. There is not the slightest impossibility or even very serious difficulty in eliminating uncertainties to such an extent in practically any piece of construction work that the contract forms in common use will provide amply for all contingencies. In the rare case where they will not any reputable contractor will meet the engineer half way in an adjustment of differences. It is a popular notion, we know, to believe differently, but it is a callow notion.

Turning now to the argument of the flexibility of the day labor system in allowing for changes in plans, etc., we must credit it with some force. Conditions sometimes develop which make it desirable or even necessary materially to modify or radically change the plans upon which a contract has been based. Such changes are always unfortunate and usually expensive in contract work, the contractor being in the more advantageous position in the negotiations for the price to be paid for the work under the revised plan. If, on the other hand, the work is done by day labor, changes of any kind may be made, at any time, often without unduly increasing the cost of the work and sometimes even materially reducing it. Admitting these things we may well ask: How often are changes in plan actually the necessity of indeterminate conditions and how often are they merely the result of insufficient and perhaps inefficient study of the problem before the plans were prepared for its solution? It is a very common complaint of engineers that they are often prevented from making the thorough preliminary studies that are essential to developing the most efficient and economical plans. Will not the fact of the possible increase in the cost of construction, resulting from changes in the proposed plans after the letting of contracts lead to more careful and mature study and hence to an ultimate saving in cost and gain in efficiency? Conversely may the admitted greater flexibility in this respect of the day labor system of work not be a direct encouragement of hasty and careless preliminary studies? These are legitimate questions and we have not seen them answered convincingly from the day labor advocate's standpoint.

To sum up most favorably, while there may be an occasional piece of work in which the considerations stated may count for something, they furnish a very weak reason for employing generally a method of doing work which experience has proven to be excessively expensive. It is cost that determines the efficiency of a method of doing work and cost is so preponderantly in favor of the contract system as compared with the day labor system that the latter falls little short of economic absurdity.

Garbage Disposal in Paris.—Household refuse is set out in front of houses during the night in tin, zinc, or galvanized iron cans or boxes, whence it is collected in the early morning hours by large wagons belonging to the municipality. For this service an ordinary family living in a flat pays a tax of 56 francs, or $10.80 per year. The wagons carry the rubbish to quays along the river Seine, where it is dumped upon inclined shoots which carry it onto barges, which are towed to points where the material is to be landed. Both while in the boxes along the streets and on the quay the ordure is exposed to the operations of "chiffoniers," or rag pickers, who sort out and take away rags, paper, and other articles, from the sale of which a large number of men, women, and children gain a living in Paris. There are several private establishments in the neighborhood of Parish where the household rubbish is treated for the salvage of bottles, glass, crockery, tin cans, bones, etc., but by far the most important of them is at Bondy, about 8 miles east of Paris, on the Canal de l'Ourcq, which connects with the Seine. The establishment is owned and operated by a private company which was organized and took up the business after the government of Paris had failed in its attempt to destroy the city garbage by burning. The ordure being landed at the wharves in Bondy, is carefully picked over and all rags, bones, old paper, sardine and other cans, metal, glass, oyster shells, etc., which have escaped the hook of the "chiffonier" taken out and assorted for separate treatment. The sardine, fruit, meat, and vegetable cans are cut up for tin, which is used in making toys, for which large quantities of this scrap tin are sent to Germany. The rough bones are used as material for glue, the finer ones for making knife handles, buttons, dominoes, dice, and other articles. Oyster shells, which are rich in lime and phosphates, are ground into powder which is mixed with grain and other materials to make food for poultry. The remainder of the rubbish, which consists mainly of ashes and vegetable refuse, is pulverized and sold to farmers as a fertilizer. Owing to its high percentage of potash it is too strong to be used alone; it is therefore mixed with barn yard manure. A car load of these pulverized ashes (6 to 10 tons) is sold at $4 to $6—too low to justify its transportation to any great distance, so it is used mainly within a radius of 30 or 40 miles. The extent of the supply may be inferred from the fact that the establishment at Bondy sends out from 100 to 150 car loads per day.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Method and Cost of Lining Earthan Channel with Concrete.

The channel forms a part of the Los Angeles Aqueduct on the Mojave Division, and its approximate dimensions are shown by Fig. 1. This description relates to the construction and operation of the forms used and gives the cost of lining per 100 ft. of conduit; the lining requires 0.75 cu. yd. of concrete per lineal foot of aqueduct or 75 cu. yds. per 100-ft. section.

The illustration shows the form in cross section. This form is built in sections 8 ft. long; each section consists of four yokes spaced 2 ft. 8 ins. apart and made of 2x5-in. lumber. These yokes carry a side lagging of No. 12 steel or ⅞-in. surfaced boarding. The roof lagging is made up in sections 3 ft. wide and 8 ft. long and is No. 18 gage steel. Each section is made stiff by cleats. The yokes are collapsible: First the sides can be drawn inward horizontally by loosening the slot bolts in the horizontal braces; second, the lower 18 ins. of the sides are detachable by removing the bolts *a*, *b* and *c*. It is stated that the success of the forms depends largely upon these detachable sections. Briefly then, for handling each section consists of four parts, the detachable roof, the two detachable partitions of the sides and the main body of yokes and attached siding.

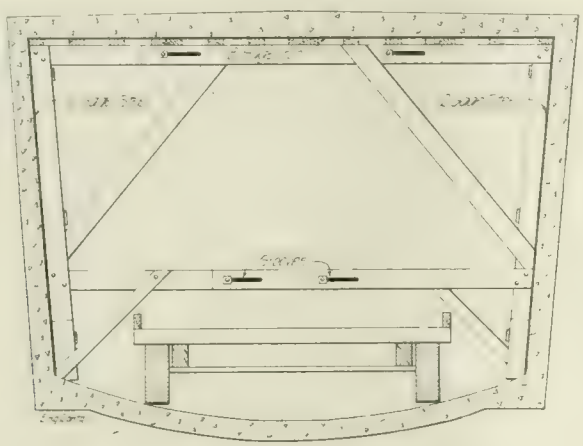

Fig. 1.—Section Showing Form for Lining Open Channel.

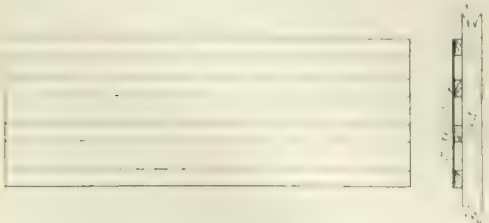

Fig. 2.—Roof Panel for Open Channel Forms.

The method of operation is as follows: Assume 600 ft. of forms as being used. Starting at a point 600 ft. ahead of the completed conduit the forms are erected a section at a time, working back toward the completed work. The concreting proceeds backward also. As soon as the finished work has been come up to, the forward section of forms is moved ahead another 600 ft. and succeeding sections are erected behind it. The sections of forms are hauled ahead on two-wheeled trucks, Fig. 3, four men handling a section readily. In erecting the forms they are set on previously cast 7x8x10-in. blocks of concrete which are placed 1 in. below grade, being adjusted to grade by wooden wedges on top of the concrete blocks.

In actual work it is aimed to line 100 ft. of channel per day using a gang of 43 men and 600 ft. of forms. This amount of forms requires, thus, to be moved every five days. The forms cost, closely, $1.50 per running foot.

The cost of lining 100 ft. of channel which requires 75 cu. yds. of concrete, runs as follows:

Gang on sides and bottom: one 11-ft. cube mixer:	
1 foreman at $3.50	$ 3.50
3 shovelers at $2.00	6.00
2 shovelers at $2.25	4.50
5 buggy men at $2.00	10.00
3 platform men at $2.25	6.75
1 engineer at $3.00	3.00
1 man at hopper at $2.00	2.00
Cover gang behind: one 6-ft. mixer:	
1 foreman at $3.50	3.50
3 laying steel, etc., at $2.00	6.00
3 buggy men at $2.25	6.75
1 engineer at $3.00	3.00
3 shovelers at $2.00	6.00
Gang on forms:	
1 carpenter boss at $4.00	4.00
3 carpenters at $3.00	9.00
12 helpers at $2.25	27.00
Materials:	
Gravel, very close, per yd., $0.75	75.00
Cement on ground, per bbl., $3.00	300.00
Total	$476.00

This gives a cost of about $6.50 per cu. yd. of concrete lining.

We are indebted to Mr. R. B. Kepner, 511 S. Boylston St., Los Angeles, Cal., one of the engineers on the work, for the information given above. Mr. Kepner states that the forms have even exceeded expectations as to convenience and economy. They are light and durable, make it possible to complete a section of lining in one operation, permit the use of one general gang instead of several independent ganges, and there is a clear ditch through which to move and in which to erect forms.

Method and Cost of Constructing Concrete Lining for the Land Sections of the Hudson River Tunnels of the Pennsylvania Railroad.*

The land tunnels of the North River Tunnels of the Pennsylvania R. R. at New York city consist of 1,207 lin. ft. of double tunnel, 977 ft. on the New York side and 230 ft. on the New Jersey side.

The general design of the cross-section consists of a semi-circular arch, vertical side-walls and a flat invert, as shown in diagram by Fig. 1. The tunnel is adapted for two lines of track, each being contained in its compartment or tunnel. The span of the arch is wider than is absolutely necessary to take the rolling stock, and the extra space is utilized by the provision of a sidewalk or "bench" forming by its upper surface a gangway, out of the way of traffic, for persons walking in the tunnels, while embedded in its mass are a number of vitrified earthenware ducts, for high and low-tension electric cables. The provision of this bench enables its vertical wall to be brought much nearer to the side of the rolling stock than is usually possible, thus minimizing the effects of a derailment or other accident. Refuge niches for trackmen, and ladders to the top of the bench, are provided at frequent intervals. In cases where a narrow street limits the width of the structure, as on the New York side, the two tunnels are separated by a medial wall of masonry, thus involving excavation over the entire width of both tunnels, and in such case the tunnels are spoken of as "Twin Tunnels"; where the exigencies of width are not so severe, the two tunnels are entirely distinct, and are separated by a wall of rock. This type is found on the Weehawken side. The arches are of brick, the remainder of the tunnel lining being of concrete.

The general sequence of building the masonry lining is shown in Fig. 1. The operations were as follows:

(1)—Laying concrete for the whole height of the sand-walls, and for the floor and foundations for walls and benches up to the level of the base of the conduits.

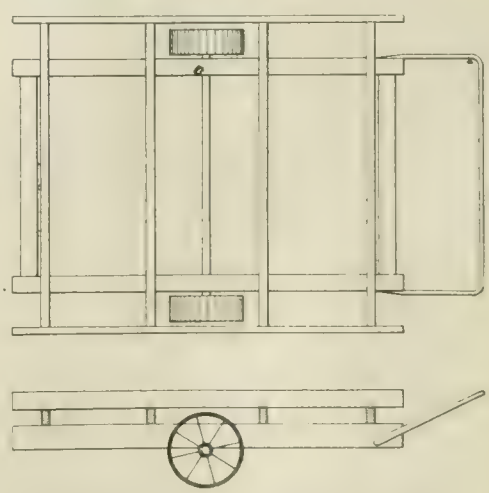

Fig. 3.—Cart for Transporting Forms.

(2)—Water-proofing the side-walls, and, where there was a middle trench containing subgrade conduits, laying and water-proofing these conduits.

(3)—Building concrete wall for conduits to be laid against, and where there was a middle trench, filling up with concrete between the conduits.

(4)—Laying conduits.

(5)—Laying concrete for benches and middle-wall.

(6)—Building haunches from top of bench to springing of brick arch.

*Extracted from a paper by B. H. M. Hewett and W. L. Brown, Proceedings American Society of Civil Engineers, Vol. xxxvi, p. 690.

(7)—Building brick arch and part of concrete back-filling.

(8)—Finishing back-filling.

The whole work will be generally described under the headings of Concrete, Brickwork, Water-proofing and Electric Conduits.

Concrete.—The number of types and the obstructions caused by the heavy posting of the timbering made it inadvisable to use built-up traveling forms at the Manhattan side, though they were used in the Weehawken Rock Tunnels.

The specifications required a facing mixture of mortar to be deposited against the forms simultaneously with the placing of the concrete. This facing mixture was dry, about 2 ins. thick, and was kept separate from the concrete during the placing by a steel diaphragm. The diaphragm was removed when the concrete reached the top of each successive layer, and the facing mixture and concrete were then tamped down together. This method was at first followed and gave good results, which was indeed a foregone conclusion, as the Weehawken shaft had been built in this way. However, it was found that as good results, in the way of smooth finish, were to be obtained without the facing mixture by spading the concrete back from the forms, so that the stone was forced back and the finer portion of the mixture came against the forms; this method was followed for the rest of the work. All corners were rounded off on a 1-in. radius by moldings tacked to the forms; this method was followed for the about four times, and were carefully scraped, planed, filled at open joints and oiled with soap grease each time they were set up. When too rough for face work they were used for sand-wall and other rough work.

The mixing was done by a No. 4 Ransome mixer, driven by 30-hp. electric motors. The mixer at Manhattan was set on an elevated platform at the north end of the intercepting arch; that at Weehawken was placed at the entrance to the tunnels. The sand and stone were stored in bins above the mixers, and were led to the hoppers of the mixers through chutes. The hoppers were divided into two sections, which gave the correct quantities of sand and stone, respectively, for one batch. The water was measured in a small tank alongside. A "four-bag" batch was the amount mixed at one time, that is, it consisted of 4 bags of cement, 8¾ cu. ft. of sand, and 17½ cu. ft. of broken stone, and was called a 1:2½:5 mixture. It measured when mixed about ¾ cu. yd.

The cement was furnished to the contractor by the railroad company, which undertook all the purchasing from the manufacturer, as well as the sampling, testing and storing until the contractor needed it. The railroad company charged the contractor $2 a barrel for this material.

The sand was required by the specifications to be coarse, sharp, and silicious, and to contain not more than 0.5 per cent of mica, loam, dirt or clay. All sand was carefully tested before being used. The stone was to be a sound trap or limestone, passing a 1½-in. mesh and being retained on 2⅜-in. mesh. The contractor was allowed to use a coarser stone than this, namely, one that had passed a 2-in. and was retained on a 1½-in. mesh.

The concrete was to be machine-mixed, except in cases of local necessity. The quantity of water used in the mixture was to be such that the concrete would quake on being deposited, but the engineer was to use his discretion on this point. Concrete was to be deposited in such a manner that the aggregates would not separate. It was to be laid in layers, not exceeding 9 ins. in thickness, and thoroughly rammed. When placing was suspended a joint was to be formed in a manner satisfactory to the engineer. Before depositing fresh concrete, the entire surface on which it was to be laid was to be cleaned, washed and brushed, and slushed over with neat cement grout. Concrete which had begun to set was not to be used, and retempering was not to be allowed. The forms were to be substantial and hold their shape until the concrete had set. The face forms were to be of matched and dressed planking, finished to true line and surfaces; adequate measures were to be taken to prevent concrete from adhering to the forms. Warped or distorted forms were to be replaced. Plastering the face was not allowed. Rock surfaces were to be thoroughly washed and cleaned before the concrete was deposited. These specifications were followed quite closely.

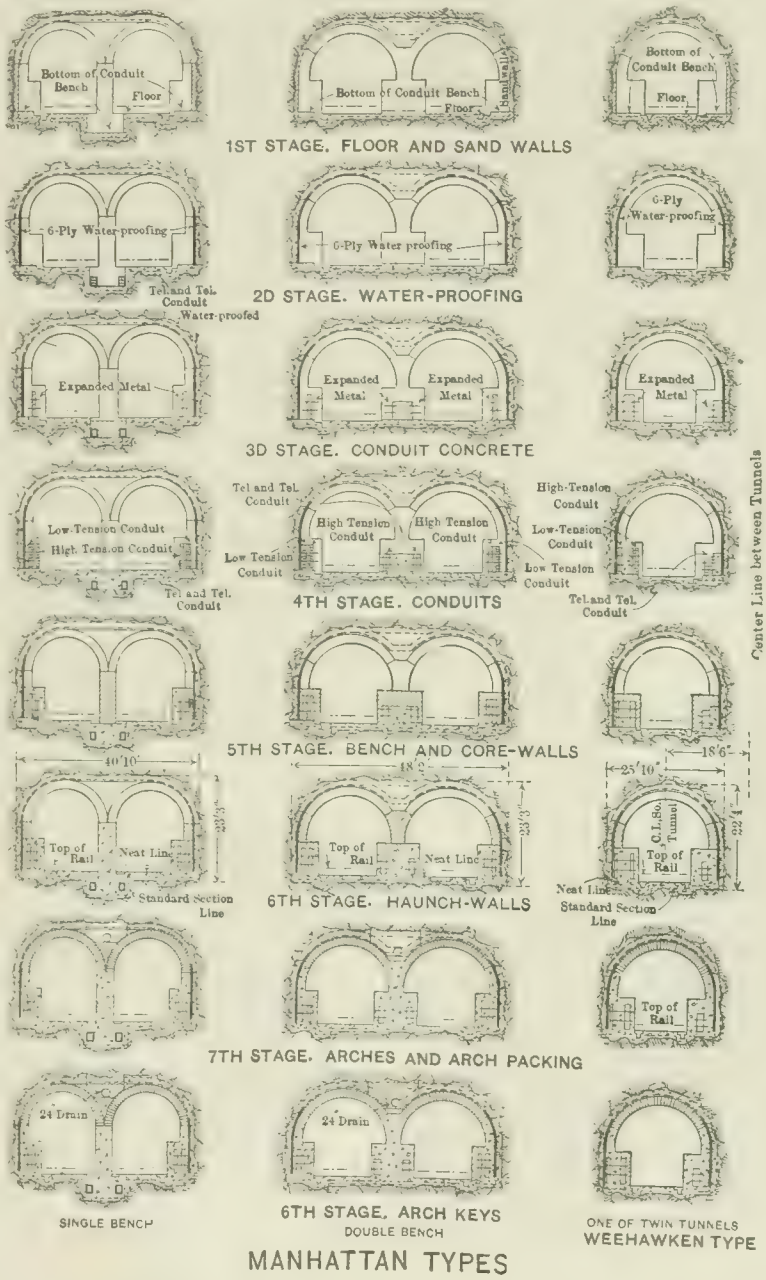

Fig. 1.—Sections Showing Sequence of Operations in Placing Concrete Tunnel Lining.

A typical working gang, as divided among the various operations, is shown below:

	Per month.
Superintendence:	
½ superintendent at	$250
½ assistant engineer at	150
1 assistant superintendent at	150
Surface Transport:	Per day.
1 foreman at	$2.50
1 engineer at	3.00
1 signalman at	2.00
16 laborers at	1.75
3 teams at	7.50
Laying:	
1 foreman at	$4.00
8 laborers at	2.00
Forms:	
1 foreman at	$4.50
4 carpenters at	3.25
5 helpers at	2.25
Tunnel Transport:	
¼ foreman at	$3.25
¼ engineer at	3.00
¼ signalman at	2.00
4 laborers at	1.75
Mixers:	
¼ foreman at	$3.25
2 laborers at	1.75

The superintendent and assistant engineer looked after the brickwork and other work as well as the concrete. The surface transport gang handled all the materials on the surface, including the fetching of the cement from the cement warehouses.

The tunnel transport gang handled all materials in the tunnel, but, when the haul became too long, the gang was reinforced with laborers from the laying gang. Of the laying gang, two generally did the spading, two the spreading and tamping, and the remaining force dumped the concrete. The general cost of this part of the work is shown in Table I.

The figures in Table I include the various items built into the concrete and some that are certificate extras in connection with the concrete, such as drains, ironwork and iron materials, rods and bars, expanded metal, doors, frames and fittings, etc.

Water-proofing.—According to the specifications, the water-proofing was to consist of seven layers of pitch and six layers of felt on the side-walls and a ½-in. layer of mastic, composed of coal-tar and Portland cement, to be plastered over the outside of the arches.

By the time the work was in hand, some distrust had arisen as to the efficiency of this mastic coating, and a great deal of study was devoted to the problem of how to apply a felt and pitch water-proofing to the arches. The difficulty was that there was no room between the rock and the arch or between the timber and the arch (as the case might be) in which

to work. Several ingenious schemes of putting the felt on in layers, or in small pieces like shingles, were proposed and discussed, and a full-sized model of the tunnel arch was even built on which to try experiments, but it was finally decided to overcome the difficulty by leaving out the arch water-proofing altogether and simply building in pipes for grouting through under pressure, in case it was found that the arch was wet.

As to the arch built through the length excavated by cut-and-cover on the New York side, it was resolved to water-proof that with felt and pitch exactly as the side-walls were done, the spandrel filling between the arches being raised in a slight ridge along the concrete line between tunnels in order to throw the water over to the sides. The portions of arch not water-proofed were rather wet, and grouting with a 1:1 mixture was done, but only with the effect of stopping large local leaks and distributing a general dampness over the whole surface of the arch.

TABLE I.—COST OF CONCRETE IN LAND TUNNELS, IN DOLLARS PER CUBIC YARD.

	Manhattan.	Weehawken.	Total yardage.
Cubic yards placed	14,706½	3,723	18,429½
Labor:			
Surface transport	$ 0.31	$ 1.43	$ 0.54
Superintendence and general labor at point of work	0.31	1.31	0.51
Mixing	0.52	0.56	0.53
Laying	1.38	1.45	1.39
Tunnel transport	1.30	1.47	1.34
Cleaning	0.21	....	0.17
Forms, erecting and removal	1.58	1.51	1.56
Total labor	$ 5.61	$ 7.73	$ 6.04
Material:			
Cement	$ 2.30	$ 2.22	$ 2.28
Sand	0.34	0.40	0.36
Stone	0.91	0.61	0.85
Lumber for forms	0.47	0.45	0.47
Sundry tunnel supplies	0.16	0.17	0.16
Total materials	$ 4.18	$ 3.85	$ 4.12
Plant running	$ 0.44	$ 0.44	$ 0.44
Surface labor, repairs and maintenance	0.25	1.24	0.44
Field office administration	0.50	1.72	0.75
Total field charges	$10.98	$14.98	$11.79
Plant depreciation	$ 0.62	$ 1.57	$ 0.81
Chief office administration	0.24	0.31	0.25
Total average cost per cubic yard	$11.84	$16.86	$12.85
Cost of Miscellaneous Items in Concrete:			
Amount, in dollars	$6,184.83	$1,756.79	$7,941.62
Unit cost	0.42	0.47	0.43

The 24-ft. 6-in. tunnel adjoining the Terminal Station-West was water-proofed by a surface-rendering method which, up to the present time, has been satisfactory. Generally speaking, the arches of the land tunnels, though not dripping with water, are the dampest parts of the whole structure from Tenth Ave. to Weehawken, and it would seem as if some form of water-proofing over these arches would have been a distinct advantage.

There was no difficulty in applying the water-proofing on the side-walls, after a little experience had been gained as to the best methods. The specifications required the sand-wall to be covered with alternate layers of coal-tar pitch and felt, seven layers of the former and six layers of the latter, the felt to be of Hydrex brand or other equally satisfactory to the engineer. The pitch was to be straight-run, coal-tar pitch which would soften at 60° F., and melt at 100° F., being a grade in which distillate oils, distilled from it, should have a specified gravity of 1.105. The pitch was to be mopped on the surface to a uniform thickness, of 1-16 in., and a covering of felt, previously mopped with pitch, was to be applied immediately. The sheets were to lap not less than 4 ins. on cross-joints and 12 ins. on longitudinal joints, and had to adhere firmly to the pitch-covered surface. This layer was then to be mopped, and another layer placed, and so on until all the layers were in place. This water-proofing was to extend from the bottom of the cable conduits to the springing of the brick arch. Where sub-track conduits were used, these were to be surrounded with their own water-proofing. The work was carried out as specified; the sand-walls were not rendered, but were built smooth enough to apply the water-proofing directly to them. They were dried with gasoline torches before the application of the pitch, and in very wet sections grooves were cut to lead the water away.

The first attempts were with the felt laid in horizontal strips. This ended very disastrously, as the pitch could not sustain the weight of the felt, and the whole arrangement slipped down the wall. The felt was then laid vertically, being tacked to a piece of horizontal scantlinig at the top of the sand-wall and also held by a row of planks braced against it at about half its height. A layer of porous brick was laid as a drain along the base of the water-proofing, covered by a single layer of felt to prevent it from becoming choked with concrete.

The water-proofing of the sub-track conduits was troublesome, as the numerous layers and the necessity for preserving the proper laps in both directions between adjacent layers made the whole thing a kind of Chinese puzzle. Various modifications, to suit local conditions, were made from time to time. Conduits outside the general outline of the tunnel are difficult to excavate, to lay, and to water-proof, and should be avoided wherever possible.

The usual force in water-proofing consisted of a foreman, at $3.50 per day, and nine laborers at $1.75 per day. These men not only laid the water-proofing, but transported the materials, heated the pitch, and cut up the rolls of felt. In general, two men transported material, one tended the heater, and the other six worked in pairs, two preparing the surface of the concrete sand-wall, two laying pitch, and two laying felt.

The cost of the water-proofing operation was about as shown in Table II.

TABLE II.—COST OF WATERPROOFING, IN DOLLARS PER SQUARE FOOT.

	Manhattan.	Weehawken.	Total.
Square feet covered	47,042	13,964	60,736
Labor	$ 0.07	$ 0.07	$ 0.07
Material	0.12	0.09	0.11
Total field charges	$ 0.19	$ 0.16	$ 0.18
Chief office and plant depreciation	0.01	0.03	0.02
Total average cost	$ 0.20	$ 0.19	$ 0.20

Brickwork in Arches.—Owing to the heavy timbering, the brickwork at Manhattan was interfered with to a considerable extent, and the gang was always kept at work at two or more places. The work was carried up to a point where it was necessary to back-fill, or prop or cut away encroaching timbers, and then the men were moved to another place while this was being done.

The centers were set up in sets of seven, spaced 4 ft. apart. Two 14-ft. lengths of 3 by 4-in. yellow pine lagging were used with each set of ribs, with 24x8-in. block lagging in the crown.

All centers were set ¼ in. high, to allow for settlement, except in the 24-ft. 6-in. span, in which they were set ½ in. high. This proved ample, the average settlement of the ribs being 0.01 ft. and of the masonry, 0.003 ft. In the 24-ft. 6-in. span the ribs were strengthened with 6x6-in. blocking and 12x12-in. posts to subgrade. Great trouble was here encountered with encroaching timbering, due to the settlement of the wide flat span. Grout pipes were built in, as previously mentioned.

Each mason laid an average of 0.535 cu. yd. of brickwork per hour, or 4.28 cu. yds. per day. The number of bricks laid per mason per hour was 218, or 1,744 per day.

The bricks were of the best quality of vitrified paving brick, and were obtained from the Jamestown Brick Co., of Jamestown, N. Y. The average size was 8¾x3 15-16x2 7-16 ins.; the average number per cubic yard of masonry was 408, the arches being from 19 ft. to 24 ft. 6 ins. in span and from 22 to 27 ins. thick. The joints were 3-16 in. at the face and averaged 9-16 in. through the arch.

The proportions for mortar were 1 of cement and 2½ of sand. One cubic yard of masonry was composed of 73.5 per cent brick and 26.5 per cent mortar. The volume of the ingredients in a four-bag batch was 12.12 cu. ft. and the resulting mixture was 9.54 cu. ft. The number of barrels of cement was 0.915 per cu. yd. of masonry, and about 17.7 per cent of the mortar made was wasted. The average force employed was:

Laying:	Per day
1 foreman at	$3.00
4 layers at	6.00
8 tenders at	2.00
2 mixers at	2.00
Forms:	
1 foreman at	$4.50
4 carpenters at	3.50
5 helpers at	2.25
Transport:	
¼ hoist engineer at	$3.00
¼ signalman at	2.00
4 laborers at	2.00

For materials, the following prices prevailed: Cement, $2.00 per bbl.; Sand, $0.90 to $1.00 per cu. yd.; Brick, $16 per thousand, delivered at yard; Centers, $26 each; Lagging, $45 per 1,000 ft. B. M. The cost of the brickwork is given in Table III.

TABLE III.—COST OF BRICKWORK.

	Manhattan.	Weehawken.	Total.
Cubic yards placed	4,137	790	4,927
Labor:			
Surface transport	$ 0.35	$ 1.19	$ 0.48
Superintendent and general labor at point of work	0.17	0.04	0.16
Laying and mixing	2.58	3.20	2.60
Forms: erection and removal	2.62	0.32	2.25
Tunnel transport	1.19	1.12	1.18
Total labor	$ 6.91	$ 5.87	$ 6.75
Material:			
Brick	$ 6.56	$ 6.56	$ 6.56
Cement	1.76	1.75	1.76
Sand	0.20	0.28	0.22
Forms	0.92	0.98	0.93
Overhead conductor pockets	0.15	0.09	0.11
Total material	$ 9.59	$ 9.66	$ 9.67
Plant running	$ 0.55	$ 0.30	$ 0.51
Surface labor, repairs and maintenance	0.36	1.30	0.51
Field office administration	0.55	0.88	0.60
Total field charges	$17.96	$18.01	$17.97
Chief office administration	$ 0.60	$ 0.66	$ 0.61
Plant depreciation	0.35	0.64	0.39
Total average cost per cubic yard	$18.91	$19.31	$18.97

In Table IV the cost of grout is expressed in terms of barrels of cement used, because that was in the schedule of prices attached to the contract as the unit of payment for grout.

TABLE IV.—COST OF GROUT OVER ARCHES IN LAND TUNNELS, IN DOLLARS PER BARREL OF CEMENT USED.

	Manhattan, (Gy-East only).	Weehawken.	Total.
Barrels used	3,000½	261½	3,262
Labor	$ 0.55	$ 0.46	$ 0.53
Material	2.30	2.25	2.28
Field office administration	0.08	0.06	0.08
Plant and supplies	0.10	0.07	0.09
Total field charges	$ 3.03	$ 2.84	$ 2.98
Chief office and plant depreciation	0.21	0.22	0.22
Total average cost	$ 3.24	$ 3.06	$ 3.20

Vitrified Earthenware Conduits for Electric Cables.—The general drawings will show how the ducts were arranged, and that manholes were provided at intervals. They were water-proofed, in the case of those embedded in the bench, by the general water-proofing of the tunnels, which was carried down to the level of the bottom of the banks of ducts; and in the case of those below subgrade, by a special water-proofing of felt and pitch wrapped around the ducts themselves.

The portion of wall in front of the ducts was bonded to that behind by bonds, mostly of expanded metal, passing between the ducts. Examples of the bonding will be seen in the drawings.

The joints between successive lengths of 4-way and 2-way ducts were wrapped with two thicknesses of cotton duck, 6 in. wide, those of single-way ducts were not wrapped, but plastered with cement mortar. The ducts were laid on beds of mortar, and were made to break joints at top and bottom, and side to side with the adjacent ducts. They were laid with a wooden mandrel; a square leather washer at the near end acted as a cleanser when the mandrel was pulled through.

The specifications required the ducts to be laid at the same time as the concrete and be carried up with it, but this was found to be a very awkward operation, as the tamping of the concrete and the walking of men disturbed the ducts, especially as the bonds lay across them. It was resolved, therefore, to build the portion of the wall behind the ducts first, with the bonds embedded in it at the proper heights and projecting from it, then to lay up the banks of ducts against this wall, bending the bonds down as they were reached, and finally, after all the ducts were in, to lay the concrete in front of and over the top of the ducts. Several detailed modifications of this general scheme were followed at one time or another when necessary or advisable.

The laying of ducts below subgrade was not complicated by the presence of bonds; the water-proofing caused the trouble here, as before described.

The specifications called for a final rodding after completion. Ordinary ¾-in. gas pipe was used for the rod, and a cutter with rectangular cross-section and rounded corners was run through ahead of the mandrel: following the cutter came a scraper consisting of several square leather washers, of the size of the ducts, spaced at intervals on a short rod. The mandrel itself was next put through, three or four men being used on the rods. All the ducts in a bank were thus rodded from manhole to manhole. When a duct was rodded it was plugged at each end with a wooden plug. A solid wooden paraffined plug was used at first, but afterward an expansion plug was used.

Very little trouble was met in rodding the power conduits, except for a few misplaced ducts, or a small mound of mortar or a laying mandrel left in. At such points a cut was made in the concrete and the duct replaced.

In the subgrade telephone and telegraph ducts east of the Manhattan Shaft, much trouble was caused by grout in the ducts. The mandrel and cutters were deflected and broke through the web of the ducts rather than remove this hard grout. Trenches had to be cut from the floor to the top of the water-proofing, the latter was then cut and folded back, and the ducts replaced. To do this, a number of ducts had to be taken out to replace the broken ones and get the proper laps. The water-proofing was then patched and the concrete replaced. This grout had not penetrated the water-proofing, but had got in through the ends of the ducts where they had not been properly plugged and protected. The duct gang, both for laying and rodding, generally consisted of 1 foreman, at $3.50 per day, and 9 laborers, at $1.75 per day. When laying: 4 men were laying, 2 men mixing and carrying mortar, and 3 were transporting material. When rodding: 4 men were rodding, 2 men at adjacent manholes were connecting and disconnecting cutters and mandrels, 1 was joining up rods, and 2 men assisting generally.

The cost of this work is shown in Table V.

TABLE V.—COST OF CONDUIT WORK.

	Manhattan.	Weehawken.	Total.
Duct feet	115,962	35,155	151,117
Labor	$0.035	$0.032	$0.034
Material	0.043	0.052	0.045
Total field charges	$0.078	$0.084	$0.079
Chief office and plant depreciation	0.005	0.008	0.006
Total average cost	$0.083	$0.092	$0.085

Cost of Making Sewer Connections.—Data on the construction of sewer connections in 1909 in the city of Waltham, Mass., are given in the annual report of the city engineer as follows:

Connections with sewer, 4 and 5-in	56
Total length of street work	1,328 ft.
Total length of lawn work	1,673 ft.
Average cost of street work	$ 9.51
Average cost of lawn work	12.63
Street Work:	
Average cost of labor per yd.	0.456
Average total cost	.618
Average cost per lin. ft.	.372
Lawn Work:	
Average cost of labor per yd.	.51
Average total cost	.72
Average cost per lin. ft.	.407

There were 89 stoppages in house connections and the average cost of repairing these was $1.92 for connection.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Methods and Costs of Operating Well Drilling Machines in Prospecting for Copper.*

The ground to be prospected is divided into 200-ft. squares, each corner being marked as a drill hole location. Roads are then built to these locations, the road work being kept far enough in advance of the drills to avoid delays on this score. As the roads must be at least 9 ft. wide and substantially built, and as the surface of the ground prospected is almost invariably rough, these roads are quite an item of expense. Moreover, since they can seldom be used for any other purpose, they must usually be charged entirely to drilling. The roads should not exceed 15 per cent in grade. A drilling machine can pull up a steeper grade, but the team of horses hauling the coal and supplies must be considered.

Before drilling can be commenced an adequate water supply must be provided, and this is not always easy in the Miami district. Water is pumped from wells, springs, or underground workings, through pipe lines as much as 3 miles in length, to tanks placed at the highest points on the ground to be drilled, and thence through temporary lines to the machines. Between an actual shortage of water in periods of drought and the freezing and bursting of these temporary lines in cold weather, much time may be lost in the shut downs.

The machines now in use in Arizona are of the traction type. Both Keystone and Star outfits are in use. Drilling practice is practically the same in all cases, so the following description of Miami methods is applicable to all.

When a machine arrives at a location, it is blocked and leveled; the drive wheels are disconnected from the engine, and the spudding arm is attached to it. The mast is raised and steadied with wooden braces and with ⅝-in. steel guy wires. A floor, 14x18 or 20 ft., built of 2-in. plank, is laid in front of the machine; in the summer a simple roof of corrugated iron is built over this floor, sides and ends of the same material being added in winter. A longitudinal opening about 3 ft. wide is left in the roof to allow the handling of casing and tools. Water tanks and a portable coal box are also placed before drilling commences.

The string of tools for starting a hole, or "spudding in," usually consists of a 10-in. bit, 4 ins. x 20 ft. auger stem, and rope socket. The tools are strung up, a hole is cut in the floor where they will drop, and "spudding in" commences. When spudding, the cable passes direct from the tools over the crown pulley, down to the spudding wheel, and thence to the drum where the excess cable is wound. This spudding line is generally a section cut from a worn drilling cable; 1⅞ in. to 2 in. manila cable is used.

The spudding wheel is moved on an arm in such a way as alternately to raise and drop the tools in the hole. As the depth increases, cable is unwound from the drum, so that the tools may always strike a fair blow on the bottom. When about 5 ft. of progress has been made, the cable is thrown off the spudding wheel so that it passes direct from the crown pulley to the drum; it is then wound on the latter, pulling the tools out of the hole.

A bailer is then lowered into the hole on 7/16 in. steel line wound on a separate reel. The bailer is often made of casing pipe—4 ins. to 8 ins. in diameter, and 10 ft. to 20 ft. long. A dart valve on the bottom opens when the bottom of the hole is reached, thus admitting the sludge. The bailer is then hoisted to the surface and emptied into a trough which conducts the sludge to the sampling device. The bailer is run until the hole is dry, or all the cuttings have been removed. It is then swung back out of the way, the drilling tools are run back into the hole, and spudding is resumed.

A varying amount of water is needed in the hole to keep the tools cool and to take up the sludge. When the natural flow is not sufficient, this water is thrown in from the surface.

With a Keystone machine, spudding may be continued to a depth of several hundred feet. With a Star machine, however, the wear and tear on machine and cable are too great, and consequently the Star driller "hitches on" as soon as practicable, generally at a depth of from 100 to 125 ft. Then, instead of carrying the motion up over the crown pulley and back again, the rope is attached by clamps and a temper-screw to a beam extending out over the hole, and operated by a crank and pitman. That part of the cable above the clamps is not used while drilling is going on, but is pulled aside out of the way. In pulling out, the cable is unclamped, the pitman taken off the crank and the beam pulled up out of the way, as shown in the photo, and the cable is then wound on the drum just as when spudding. A pair of short-stroke jars is inserted in the string of drilling tools between the stem and the rope-socket.

A drilling crew consists of two men—a driller and a helper or "tool dresser." There are two crews to a machine, each working a 12-hour shift or "tower," changing at noon and at midnight. When moving or casing, both crews work in the daytime.

Holes are drilled on the average to a depth of 500 ft. or until below the limits of commercial ore. The rate of drilling is quite variable, depending on the rock encountered, the depth, and the amount of water flowing into the hole. With a 10 in. bit in average dry rock, which stands up well, 40 or 50 ft. per tower is not uncommon. On the other hand shattered and silicified schist which tend to cave and settle in the hole, and soft, sandy schist and granite which tend to run in at the bottom, are often encountered in the Miami district, and in such material, a drill may work a week or so and make little or no progress; in fact, the ground may come in faster than it can be drilled out. The presence of much water in a deep hole may also retard drilling, both by flotation of tools and cable, and by resisting the motion. In such cases it appears advisable to use a wire cable, with 100 to 150 ft. of manila cable, inserted immediately above the tools to absorb the shock and lessen the strain on the machine. Table I shows in a general way the variations in the rate of progress with respect to depth of hole and nature of work:

It is evident that in very shallow holes, the time required for moving and setting up may become a prominent factor in determination of the average rate of progress. Under delays are included shut-downs, redrilling bad holes, cleaning out after casing, and except in No. 2, time spent in fishing for tools lost in the hole. A drilling machine is expected to average 750 ft. a month, everything included.

Delays in drilling may be due to various causes, as noted above, some of the chief of these being briefly explained here.

*Condensed from a paper by Wm. G. Weber in the "Wisconsin Engineer" for April, 1910, describing practice in Arizona.

TABLE I.

	Time (Hours).									
	Drilling.	Repairs.	Delays.	Moving.	Casing.	Total.	Depth of hole (ft.)	Depth of permanent water level (ft.).	Rock.	Kind of drilling.	Ft. per 24 hrs.
1	7	11	12	41	..	136	103	...	Granite	Fair	18.2
[illegible]	17	12	60	45	14	303	252	...	Granite and Schist	Poor (Caving)	19.9
2	(Same as above + total time fishing.)					684	252	...	Granite and Schist	Poor (Caving)	8.8
3	...	...	...	...	...	336	340	(?)	Schist	Fair	24.3
4	...	...	..	..	...	456	421	290	Schist	Fair	22.1
[illegible]			..	..	..	420	427	(?)	Granite and Schist	Fair	24.5
6	369	8	113	47	43	580	468	320	Granite and Schist	Poor (Caving)	19.4
7	...	...	..	..	.	468	505	300	Schist	Fair	25.9
8	487	5	120	52	66	730	527	15	Schist and Granite	Poor (wet and Caving)	17.3
9	292	6	197	47	33	575	555	255	Granite	Poor (Caving)	23.3

12	376	32	86	35	...	529	645	(?)	Granite	Good	29.3

Crooked holes, and flat holes are sometimes encountered. Theoretically a drill hole should always be vertical, round and up to gage, but either through carelessness on the part of the driller or otherwise, variations from the ideal hole are many and troublesome. As a result the bit sticks or the tools lag and do not hit an effective blow. The common remedy is to fill the hole up above the bad place with fragments of quartz gathered on the surface, and then redrill it. Sometimes a four-winged star bit is used in place of the regular shaped bit and extra wide rope sockets are also used to reduce the play of the upper end of the tools in the hole. Shooting the hole with dynamite is occasionally attempted with rather indifferent success. In spite of all precautions few drill holes are vertical or straight, the tendency being to deflect a foot or two in a hundred.

Cavings, or pieces of rock falling from the sides of a hole may seriously delay drilling, as well as interfere with sampling. Large quantities of rock often fall suddenly on the tools and may wedge them in so tightly as to make it necessary to cut the cable, if indeed it does not break, and fish for them with a second string. Sands running in from below may produce the same effect. These cavings occasionally fill the hole as much as 50 ft. or even more above the bottom, and even if they do not catch the tools, much time is lost removing them. Usually casing the hole will stop the caving. Three sizes of casing are used in Miami, 7⅝ ins., 6¼ ins. and 4½ ins. in diameter, weighing 8 to 13 lbs. per foot. When a hole is cased, it is of course necessary to use smaller bits and tools. Four sizes of bits are used, 10 ins., 7⅝ ins., 6¼ ins. and 4½ ins., these figures representing the diameter when dressed to gage. With the last named bits, a smaller string of tools, 3¼ ins. in diameter, is used.

A hole may thus be cased several times if necessary. Each size of casing reaches to the top of the hole, and all are removed when the hole is finished. When casing is being handled, the drilling tools are lashed to the mast, and usually the manilla cable is unwound from the drum, a wire cable being put on in its place. With this line, the joints of casing, each 18 ft. to 20 ft. long, are hoisted up, over the hole one by one, threaded together and lowered until the bottom is reached, or until they will go no further. The casing rarely needs to be driven, and then only with light blows, this being accomplished by stringing up the tools and dropping them gently on a block placed on the upper joint [illegible]

To remove casing the process of lowering is reversed. When it does not pull readily, pulley blocks or hydraulic jacks or both are used, and occasionally dynamite is lowered into the hole and exploded to jar the ground loose. There are also a number of special tools, such as steel nipples, casing spears and the like, used in special cases and better described in the makers' catalogues than is possible here.

Finally, a serious factor in delaying drilling is the fishing job. The cable or one of the tools may break, a joint may become unscrewed, or the tools may be wedged so tightly by sudden falls of ground or runs of sand, that the jars will not work and the rope must be cut. Then the fishing job commences. Many and various tools are kept ready for emergencies, for it takes weeks to get anything from the supply houses. A fishing job is delightfully uncertain; it may last an hour or a week, or the hole may eventually have to be abandoned. In the last case, a new hole is usually started a few feet away. A second and a third string of tools may be lowered into a hole, to recover the ones already there, only to be lost in turn. Sometimes when success seems assured, some unexpected occurrence puts things in worse shape than before. Thus in one hole, a bit broke off at the pin, and the driller lowered a horn socket gently, to feel for the part remaining and learn, if possible, how it lay. The horn socket is aptly described by its name—resembling a megaphone somewhat, in shape—and in this case it slipped over the bit and took just enough friction hold to bring it along to the surface and then drop it back in the hole, where it remains yet, all further efforts to recover it proving unavailing.

The object of this drilling is, of course, to obtain information concerning the ground penetrated. For this purpose the sludge is bailed out at 5 ft. intervals, approximately the true depth being determined each time by measuring on the boiler line. The sludge is dumped into a trough and conducted to a split divider which diverts ⅛ of the material into a tub. This amount may subsequently be reduced to 1/16, 1/32, or 1/64 if desired, by repouring the contents of the tub through the divider. The sludge is then dried over a fire, care being taken to prevent loss of sulphur through roasting; and the dried sample—which should weigh 25 or 30 lbs.—is sacked, tagged with the number of the hole and the depth at which it was obtained, and sent to the assay office. A sampler is employed on each shift to do this work. When two machines are working close together he can attend to both. He also takes a portion of each sample and pans it, noting the copper and iron minerals present, and their approximate abundance. The sulphides and oxides concentrate in the bottom of the pan; the copper carbonates and silicates are washed off, but may readily be detected even in minute quantities because of their bright colors. This and other information is recorded on a report blank.

The nature of the rock penetrated may be determined by the relative quantities of various minerals found in the sludge, and also by examination of such small uncrushed fragments as are often bailed out. When the formation is not the same from top to bottom, and the hole is caving, the exact nature of the rock penetrated may be indeterminable.

Faults and veins are quite readily detected in the capping over the ore through the presence of clay in the sample, also through marked variations in the amounts of iron oxides, copper carbonates, or quartz present in the sample. The width of the fault is represented by the distance through which this marked difference in mineralization occurs, but when the fault is steeply inclined, this is of course much greater than the true width. Faults in the sulphide zone are not so readily detected and doubtless are often overlooked.

Too much reliance should not be placed on the results obtained by drilling. Raises have been put up on a number of holes both at Ray and Miami, and while in some cases the drill returns and those form the raise check out quite satisfactorily, in other cases very poor results are obtained. A variation as great as 0.5 per cent has been found to occur in ores averaging 3 per cent or less. As a rule, the drill returns are low, a fact which is rather hard to explain. It is possible that the heavy sulphides tend to settle in the bottom of the hole and in fissures and pockets in the sides where they are undisturbed by the churning of the tools. In uncased holes, cavings from the overburden would of course lower the percentage of copper, and on the other hand, it has been found that after the hole has passed through a sulphide body, the samples may still indicate good ore. Under such conditions, casing changes the grade of samples materially.

Moreover, it is so easy for a careless sampler to neglect his work, especially at night. An unwashed trough may collect much concentrate; an uncleaned divider may clog and not split the sludge properly. Allowing the solids in a sample to settle and decanting off most of the water before placing the tub over a fire, is a common and legitimate practice—but too often much solid matter is allowed to float out with the water.

However, regarded not as a means of developing ore bodies, but as a means of prospecting for them, determining their boundaries and obtaining a fairly close idea as to their tenor, the churn drilling machine is certainly a rapid, efficient and comparatively cheap instrument.

The drills are owned and operated by the mining and development companies, and no contract work has as yet been attempted in the territory.

The accompanying cost data are based on an assumed average life of four years per machine. A drilling machine with tools sufficient to operate for that length of time would cost about $6,000.

The minimum amount of road required per hole is about 300 ft. When holes are drilled at 400 ft., 600 ft., or greater intervals, the item of roads becomes correspondingly greater. On the fairly steep slopes (20°) encountered in the Miami district, $0.75 is an average cost per foot of road.

COST OF DRILLING.

Item.	Cost per ft. of hole.	
Labor—		
2 drillers at $6.00 per day	$0.48	
2 helpers at $4.80 per day	0.38	
1 sampler at $4.00 per day	0.16	
1 foreman at $6.00 per day (2 machines)	0.12	
	$1.14	$1.14
Roads—		
Labor at $2.00 per day	$0.50	
Foreman at $4.00 per day	0.05	
Powder, caps and fuse	0.03	
Tools, etc.	0.01	
	$0.59	$0.59
Coal, coke, oils, etc		0.27
Water		0.10
Teaming		0.10
Assaying, office and incidentals, etc		0.16
Interest at 5 per cent and depreciation		0.20
Total cost per ft. of hole		$2.57

The monthly average of the cost per foot of hole drilled varies with one company from $2.00 to $3.00. In another instance, where holes are drilled further apart and the drilling is poorer, the cost per foot has run as high as $5. When drilling is the only means of development being used on a property, the cost of camp maintenance and incidentals considerably swells the cost account. It would hardly be fair, however, to charge these items up to drilling when a comparison with other districts is being made.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Paving Roadways Having Steep Gradients.

One of the most difficult questions which sometimes confronts city engineers is the selection of the proper material for paving streets having steep gradients. Where the street carries a considerable amount of traffic seven special factors are involved, chief of these being the consideration of providing a good foothold for the horses. In a recent issue of The Surveyor Mr. W. J. Howard-Smith discusses this problem in an interesting manner, and we have taken the matter that follows from his article.

Flint-macadam gives perhaps the most secure foothold, and some soft granite macadams may, in dry weather, be only a degree more slippery, but the greasy mud which in damp weather forms on the surface of macadam constitutes a grave objection on a hilly road and a special danger for mechanical traction.

Unfortunately slurry-bound macadam, no matter what may be the kind of stone employed, seldom long maintains a good surface. On the up-hill side it is broken up by the gripping action of the hoofs, while on the down grade it is ploughed into by the skid pans and braked wheels of heavy vehicles, deep ruts, which become a dangerous menace to traffic and necessitate constant attention and replacement of the broken surface, being thus formed. Unfortunately, when once the surface crust is broken in this way it is almost impracticable to repair the damage with any hope of permanency. The loosened metalling is kicked and scattered again and again over the roadway, to become a dangerous nuisance; and at times of heavy rainfall the down-hill rush of surface water scours out the smaller particles and then finds admittance to the foundation, thereby becoming a source of further trouble.

EXAMPLES OF STREETS WITH STEEP GRADIENTS PAVED WITH GRANITE BLOCKS.

	Locality.	Gradient.	Approximate length in yards.
(1)	City of London — Several streets leading from Thames street	1 in 11 to 1 in 15	..
(2)	Westminster—Regent st., Piccadilly circus	1 in 12 to 1 in 18	..
(3)	Bradford—Church street..	1 in 9¾	...
	Bradford—Godwin street..	1 in 12	...
	Bradford—Bridge street...	1 in 13	...

	Croydon—Waddon bridge..	1 in 14	...
	Croydon—Vicarage road...	1 in 14	...
	Gateshead—Church street.	1 in 12	160
(5)	Halifax—Pye nest	1 in 10	250
	Halifax—Upper Crown st.	1 in 12½	93
	Halifax Bolton brow	1 in 13	393
	Halifax—Haley hill	1 in 13	244
(6)	Leeds—Cookridge street..	1 in 11¼	...
	Leeds—Beeston hill	1 in 11¼	...
	Leeds—Woodhouse street..	1 in 13	...
(7)	Newcastle-on-Tyne — Pilgrim street	1 in 6	110
	Newcastle-on-Tyne — Pilgrim street	1 in 8	80
	Newcastle-on-Tyne—Hanover street	1 in 7	200
	Newcastle-on-Tyne—Akenside hill	1 in 7½	90
	Newcastle-on-Tyne Manor street	1 in 9	170
(8)	Penge—Crystal Palace hill	1 in 12	150
(9)	Windsor—The main street	1 in 9	100

Remarks—(1) These streets have very heavy lorry traffic to and from the river wharves. Billingsgate Fish Market, etc. (2) One of the busiest places in London. Setts specially dressed to a smooth surface and laid with extra close joints. (3) Several other busy streets, granite sett paved on gradients generally similar to these. (4) And several streets rather less steep. The paving is of Grey Royal, special dressed blocks 5 in. wide by 4 in. deep laid with very close joints. (5) In parts only, the middle of roadway, i. e., tramway tracks are granite setts, the haunches being of gritstone. (6) Cookridge street is a very busy thoroughfare; the two largest public halls in the city are situate at the steepest part. (7) And many other main thoroughfares in the city similarly paved, but not quite so steep. (8) Paving is of Grey Royal special dressed blocks 5 in. wide. (9) Is also the principal approach to Windsor Castle.

Both road locomotive and motor car traffic are particularly damaging to metalling on hills; the scrubbing effect of the armored tires churns up the binding particles, and the cross bars, studs and wheels of locomotives plough into the surface, especially after frost, and crush to powder the loose, friable stones.

The employment of macadam treated with tar or with any other substance which tends to make a greasy and slippery surface is, of course, out of the question, and the same objection applies to asphalt and wood paving. Basalt lava has been tried, in the form of setts from 6 in. to 8 in. sq., but, while not slippery, its unequal and open texture, the rock frequently being full of large air-holes or honeycombing, leads to rapid wear.

All things considered, states Mr. Smith, granite setts—especially when of the more modern and superior form known as special dressed blocks—form the most desirable and certainly the most durable surface for steep gradients. In fact, this is practically the only material that will satisfactorily withstand the destructive effect of modern road traffic. While somewhat costly in first laying, its long life—probably extending to 50 years or more—and cheap maintenance, make it in the long run an economical paving.

There may be an idea that where granite paving is laid on steep gradients complaints of slipperiness will be rife. In the accompanying table is given some data, kindly furnished, in most cases, by the engineers of the towns mentioned, and it will be seen from this that the complaints are practically a negligible quantity, even although such paving is laid on roadways as steep as 1 in 6, as at Newcastle. In addition to those given in the table many other cities including Liverpool, Glasgow, Edinburgh, Sheffield, Huddersfield, Aberdeen, and Swansea have examples of granite block paving on steep inclines.

In the North of England gritstone (otherwise freestone or "lonkey") setts are very largely employed for paving steep roadways, even up to 1 in 4 gradient, without complaint of slipperiness. As these setts are often 12 in. or more in width, it is obvious that horse foothold must be obtained on the rock itself, and not at the joints. By similar reasoning it follows that where granite is used it is all-important that it should be of a particularly gritty texture. Neglect of this precaution necessitates recourse to the spreading of sand or grit over the surface—which eventually results in the formation of dust and mud.

Assuming that the right kind of granite is employed, the requisite grittiness of surface will be regularly maintained by the gradual recession under attrition of the softer mineral constituents, thereby leaving the harder mineral grains standing up as minute nodules or prominences on the surface. Hence the hard particles must be of the most durable and resistant nature, as upon them falls the duty of withstanding the severe effects of hill traffic.

The most resistant substances in such granites are quartz and felspar. The softer constituent, usually mica, should lie between 15 and 25 per cent of the surface area.

For a granite to possess the right granular roughness a particular degree of coarseness of texture is requisite. If too fine, the surface is apt to polish and become very slippery, especially in hot weather. If too coarse, the hard prominent minerals wear into polished surfaces, upon which a horseshoe obtains no grip. Again, the coarser granites are not usually very tough, and are prone to break off on the arrises of the setts, which then assume a rounded form with wide joints.

This causes the paving to be noisy, uncleanly and generally objectionable.

As this roughness of granular texture is the factor mainly to be relied on to provide secure foothold, it follows that the setts need not be narrow. They should, however, have a level surface and narrow joints, not only for ease of traction, but because wide joints collect dust and mud, and, as is well known, mud on the surface of paving is a main cause of horses slipping and motors skidding.

The old idea that it was incumbent to have wide joints for obtaining horse foothold on granite sett paving is now looked upon as an exploded fallacy. It certainly was productive of an uneven surface, and is largely to blame for the prevalent view that granite paving must necessarily be noisy. That this is not the case, and that such paving may be made fairly comparable with wood for quietness is evidenced in the surfaces of Oxford-circus, Piccadilly-circus, and the adjoining part of Regent street, London (the latter on a steep gradient, as referred to in the table). Each of these places is paved with granite blocks, specially dressed in order to provide a level surface and narrow joints. There is enormous traffic over this paving, and surrounding it are some of the highest rented shops in London. It has been laid several years, but there are no complaints of noise, though soft wood abuts in the adjoining streets. At Croydon, a high-class residential town, a similar superior class of granite paving is laid in several of the best thoroughfares, sometimes between lengths of soft wood. It is officially stated that no complaints of noise due to it have been received, nor is the difference in this respect between these two materials very marked.

The paving at Croydon is notable for the form of the blocks. They are of Grey Royal granite, special dressed and laid with close joints. The result is an excellent surface, almost equalling asphalt in smoothness. Although this smooth paving is laid on numerous steep gradients throughout the town, complaints of slipperiness are unheard of.

Where traffic is of exceptional amount it may be found desirable—in order to minimize tractive effort up steep inclines—to lay "wheelers." These should be of the hardest rock, in blocks 20 in. or 24 in. wide, 8 in. deep, and not less than 3 ft. long, laid at 6-ft. centres. The surface should be smooth quarry faced, and the joints dressed squarely to full depth; the end joints should abut quite closely, as any undercutting will tend to make the stones tilt.

Methods of the New York State Commission of Highways for Testing Stone Used in Road Construction.

In connection with the Bureau of Research, the New York State Commission of Highways has established a Testing Department, which has charge of tests of the various materials used in the State Highway construction. The laboratory is equipped for making a complete standard test on highway stone. The apparatus consists of a hand stone-breaking press, a Deval abrasion machine of four cylinders, a Dorry grinding disk for hardness, two ball mills, a Page hydraulic briquette molding machine, two impact machines which are models of those in use in the office of Public Roads in Washington, and a diamond core drill. These, with one 4 H. P. motor for the main drive and two smaller ones for the impact machines, and such accessories as scales, a Lapadary saw, etc., complete the equipment.

In the recently issued report of the State Commission of Highways the methods employed by the Testing Department in making tests of highway stone are described as follows:

Upon receipt of the stone sample at the laboratory it is given a sample number which serves as a means of identification throughout the test and by which number the sample is thereafter known and reported upon.

A small specimen of this sample is then placed on file in the Bureau of Research after which the stone to be tested is broken into sizes as nearly uniform as possible by means of the hand breaking press. It is then thoroughly washed, after which it is dried for four hours, when 50 pieces of a total weight of 5 kilograms are put into a cylinder of the Deval machine and subjected to an abrasion of 10,000 revolutions at the rate of 2,000 revolutions per hour. Then the stone is removed and all fragments above the size of 0.16 cm. are washed, dried for a period of four hours, weighed, and the percentage of loss by abrasion computed per kilogram.

The diamond core drill is used for the purpose of obtaining cores from the specimen upon which the hardness and toughness tests are performed. These cores are cylinders of varying lengths with a diameter of 25 mm. For the hardness test two cores are first carefully weighed and then placed in the Dorry machine so that the ends rest on the upper side of the cast-iron grinding disk. Crushed quartz of a standard quality and size is fed on the disk from a funnel. The disk is rotated for 1,000 revolutions, after which the cores are weighed and reversed end for end in the machine. The disk is then rotated for another thousand revolutions. The cores are then taken out and weighed and the average loss in weight for 1,000 revolutions is ascertained. The empirical formula for computing the hardness value is that the hardness shall be represented by 20 less ⅛ the loss in weight, during the test, expressed in grams.

For the toughness test two core pieces are sawed by the Lapadary saw to a 25 mm. length. These are securely clamped in the impact machine and subjected to blows of a 2-kilogram hammer, transmitted through a 1-kilogram weight. The first drop is from a 1 cm. height with an increase of 1 cm. for each succeeding blow. The toughness value is represented by the number of blows required to break the specimen.

For the cementation test the material is prepared by putting fine stone and dust from same in the ball mill with a percentage of water where it is ground to a paste under the rolling action of two cast-iron balls for two hours. This is then moulded into briquettes 25 mm. in diameter and 25 mm. in length in the Page hydraulic press. After 20 hours in air and 4 hours in a steam bath these are subjected to successive blows of a hammer 1 kilogram in weight dropping from a fixed height of 1 cm. The cementing value is taken as the average number of blows necessary to rupture a briquette, tests being performed upon five briquettes in order to determine the average number. This latter test which is of recent development has not proven as satisfactory as the other tests, as the cementing value obtained by it does not seem to be proportional to the cementing value of the same stone when used in the form of screenings on the road. This is possibly due to the fact that in the laboratory the stone is ground into a fine powder or flour and cementing qualities are obtained under these conditions which do not exist in the coarser dust and small particles of stone when used as screenings on the road. An illustration of this is that a limestone, the screenings of which are known to have good binding qualities on the road, when tested in the laboratory will show a cementing value of about 60, while trap screenings alone do not bind as readily on the road as limestone screenings but the cementing value of trap as obtained from this test in the laboratory is frequently found to be as high as 200 or more.

To determine the water absorbed in pounds per cubic foot, a smooth worn stone, which has been through the abrasion test, is used. After being weighed in air it is immersed in water and immediately weighed in the water. After 96 hours of immersion it is again weighed in water. The absorption is then computed from the difference between the first and second weighings in water. The specific gravity and the weight per cubic foot of stone is determined from the air weighing and the first weighing in water.

The geological classification is determined in the laboratory, a microscopic or chemical analysis being made when necessary. Upon completion of the laboratory tests the results thereof are submitted to the Commission.

Notes on Road and Street Work.

Rolling Snow on Country Highways.—The practice of rolling snow on country highways has been in use in Vermont for over 20 years. This method has also been used in Wisconsin, Michigan and the northern counties of New York state and has proved extremely successful. The advantage over other methods of removal of obstructions caused by snow is that a hard, wide and level track is made, which permits teams to pass one another without inconvenience or danger, the snow being compacted for a width of 8 to 10 ft., or thereabouts, and is therefore smooth on either side of the beaten path, and when new snow strikes this smooth rolled surface it is easily blown away and gives little or no trouble. Sleighing remains good as long as any snow remains. In the spring, when snow is melting, little inconvenience is experienced, as the beaten track remains compact and hard and will sustain the traffic until the roadbed is exposed. The principal object derived from rolling snow is to build up the track to a height where the drifting snow will not stop in the beaten pathway. The best results are obtained by rolling immediately after the first snowfall and continuing after all succeeding falls of 8 ins. or more, and also after all heavy winds. In this way the track is kept hard from the bottom, and, as heretofore stated, during thaws or in the spring when the final thaws come, no trouble is experienced from "breaking through" or "slumping." The rollers most commonly used are of wood and of a diameter varying from 3½ to 6 ft. and with a length of 6 to 12 ft. The average weight of a 10-ft. roller, 5 ft. in diameter, is about 3,800 lbs. and the average cost of the same is $35. Usually they are not longer than 10 ft., but many are 8 ft. in length. Rollers of from 8 to 10 ft. produce the best results at a fair average cost. With rollers of 6 ft. and 8 ft. in length, the common practice is to drive the "near" horse in the "off" track going out, or vice versa, and the same coming back, thus rolling a track about 12 ft. wide with an 8-ft. roller and 14 ft. with a 10-ft. roller. Experience has demonstrated that the 10-ft. roller, made in two parts, is preferable for the majority of roads. In some localities plows especially built for opening roads through deep snows are used. These are quite massive affairs, requiring from four to eight horses to draw them, and varying in cost from the simple home made plow built at a cost of about $50, to the heavy affair used in Canada, which costs about $250. It is claimed that plowing, especially in localities where the snowfall is heavy, has the effect of making a channel in the center of the highway through which water from melting snow will flow, thus washing out the center of the road. In many towns in northern New York snow packers are used. The affair acts on the principle of a stone boat, and its effect is practically the same as a roller. In the town of Brighton in Franklin County, New York, all of the main roads were rolled, the average cost for five years being about $5 per mile. In the town of Duane, ten miles through an open country, which drifted badly, were rolled regularly and were kept in good condition throughout the entire winter for a total cost of $55. In the same town three miles of road were kept open by plowing, at an expense of a little over $30. Five miles of the same road immediately adjoining and of similar character were rolled and kept in better condition than that which was plowed, at an expense of $28. Plowing and shoveling for the entire winter cost $10 per mile. Rolling for the entire winter cost $5.60 per mile, and a bulletin of the Town Highway Bureau of the New York Department of Highways, from which the above notes have been taken, states that a better track was maintained by rolling than by plowing and shoveling.

Inspection and Repairing of Wooden Highway Bridges.—The following directions for the inspection and repairing of wooden bridges are taken from a bulletin recently issued by the Bureau of Town Highways of the New York Department of Highways for the guidance of county and town superintendents: The timbers of wooden bridges should be inspected by boring with a ¾-in. auger into the main members. This boring should be done in such a way that rain water cannot enter the hole; i. e., the hole should enter the timber from the under side. The holes should afterward be plugged with wood. The iron hangers should be equally strained. This condition can be determined by striking adjacent rods with a piece of hard wood or iron and noting the tone or pitch. The rod having the lower tone can be tightened until the pitch is the same as that of the rod having the higher tone. In case a nut is rusted fast and cannot be moved by a wrench, it can be very readily loosened by heating it quickly with a gasoline torch. Care should be exercised to avoid heating the rod, as the idea is to expand the nut and thus loosen it. If a wooden bridge is in such good condition that it will probably not be renewed for some years the covering (roof or weather boarding) should be very carefully watched, as a heavy wooden bridge might last for years if properly covered, while a small leak in the roof, if neglected, might be the cause of the bridge decaying in a few seasons. Splices and keys in the bottom chord should be watched to see that there is no crushing of the wood back of the splice bolts. The floor beams should be large enough to get a bearing over the entire width of the bottom chord and the planking should be laid with openings to clear the deck of water and dirt. The planking in all cases should be spiked to the floor joist to prevent undue vibration and noise. The mud sills and corbels should be renewed as fast as decay becomes apparent. There should be an apron of wood or stone between the bridge deck and the roadway dirt. This apron should be renewed from time to time as the necessity becomes apparent. If the trusses become weak they should be made safe in the following manner: There should be placed on the ground under the bridge or in the bed of the stream a mud sill of wood about 10 ins. square and about 3 ft. longer than the width of the bridge. A corresponding cap of like dimensions should be attached under the bridge and in contact with the trusses at a panel point. Two vertical pieces about 8 by 8 or 10 by 10 and a little longer than the distance between the mud sill and cap should be provided and should be placed by blocking the upper ends under the cap piece and then driving the lower ends until they are perfectly rigid. The lower ends should be retained by blocks spiked to the mud sills. These trestle bents should always be put up in pairs at an equal number of panel points from each end.

Side Hill Roads.—An interesting feature of the method of constructing roads in Allegany county, New York, is the manner of building dug roads on a road parallel to a side hill. These roads are built with but one ditch, which is on the upper side of the road. This ditch intercepts the water coming down from the hillsides; this water is carried across the road at short intervals by means of sluices. These roads have a continuous slant from the outer shoulder to the inner ditch, which overcomes the danger of vehicles sliding in icy weather.

Governor Hughes has signed the bill recently passed by the New York legislature providing for the issuance of $7,000,000 in 4 per cent bonds for the improvement of the Cayuga and Seneca canals. These canals are to be made a part of the barge canal system.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Methods of Constructing the Western Ave. Sewer, Chicago, Ill.

In 1904 the City of Chicago proposed to build a sewer on Western Ave. from 71st St. to the Chicago Drainage Canal. The sewer proposed was to be 9 ft. in diameter at the outlet, reducing to 6 ft. at 71st St. Mr. Isham Randolph, then Chief Engineer of the Sanitary District of Chicago, proposed a plan to the city by which the Sanitary District could use a part of this sewer and by building an extension at 39th St. to the stagnant arm of the Chicago River known as "Bubbly Creek," would be able to induce a flow through the creek and keep it in a sanitary condition.

The plan proposed is now being carried out under contract to J. W. Farley of Chicago, Ill. The sketch, Fig. 1, may be followed in a description of the location of the sewer. From the outlet into the Drainage Canal the line of sewer goes south on Western Ave. passing under the Illinois & Michigan Canal, where the sewer takes the form of an inverted siphon, to 71st St. At 39th St. a branch runs east about 1,850 ft. and north about 500 ft. to "Bubbly Creek." The contract for constructing this branch also is let to J. W. Farley. The section of the sewer which will carry the flow from "Bubbly Creek" is a vertical elipse 12x14 ft. This is built of concrete. Figure 2 shows the section of the 39th St. branch. The main sewer on Western Ave. from 39th St. to the outlet is of the same inside dimensions but the walls are 16 ins. thick all the way round and contain no reinforcement. It is this section which is at present being constructed and it is the purpose of this article to describe the methods employed for the construction. The balance of the sewer running on Western Ave. from 39th St. to 71st St. will be built of brick and will have a diameter of 9½ ft. at 39th St., reducing down to 6½ ft. at 71st St. The average depth of excavation for the construction of the brick sewer will be about 17.7 ft., while the excavation for the concrete section averages 26 ft. in depth. About 500 ft. from the outlet at the Drainage Canal this sewer passes under the Illinois & Michigan Canal in the form of an inverted siphon. The cross section of the siphon is reduced gradually from the vertical elipse of the main sewer section to a horizontal elipse 12x9 ft. The grade of the sewer is lowered 5 ft. in approaching this canal and raised again 4.99 ft. on the opposite side. In the reduction of the cross section it will be noticed that the horizontal diameter remains constant. The reduction of this area will cause a higher velocity of flow and tend to prevent sedimentation in the siphon. Figure 3 shows the inverted siphon in profile, the dotted curves representing the cross sections every 12 ft.

For purposes of construction the contractor has employed a separate outfit on the work of the siphon. This will be put in in two sections, a cofferdam being used and built to take care of one half of the work at a time. The cofferdam is built of 2x12-in. plank of three thicknesses placed so that the edges overlap. Stringers were placed on the inside about midway up, and these were braced apart with 8x8-in. timbers. Iron rods, ¾-in. in diameter, run through the cofferdam directly over the 8x8-in. timbers. These rods react against any tendency of the cofferdam to spread. The plant for handling this work consists of a Page & Schnable revolving derrick. For driving the sheeting a pair of pile driver leads were suspended from the boom of the derrick and a steam hammer was operated in them. The derrick handled the excavation in skips, taking the skips out of the trench, where the excavation was made by hand, and then was dumped into cars.

The disposal of the spoil presented some difficulty on account of a lack of a convenient dumping ground. This was secured by an arrangement with the Chicago & Alton R. R. which parallels the lower half mile of the sewer within two blocks. The railroad company built a spur from their right-of-way to the sewer and the spoil was loaded into the standard gage gondola cars and taken by the railroad company for use in track elevation. These standard gage railroad cars were switched around on the sewer work by the dinky engines shown in the accompanying views. In order to accommodate the dinky engines on the standard gage track a third rail was employed and a special coupling was made. In this manner the spoil from the lower half mile of the sewer was disposed of. The spoil for the balance of the sewer is at present being taken by the dinky engines in 4-yd. narrow gage cars, to McKinley Park, a haul of three-quarters of a mile, and is to be used there for filling low places and for making landscape effects.

The plant employed by the contractor in

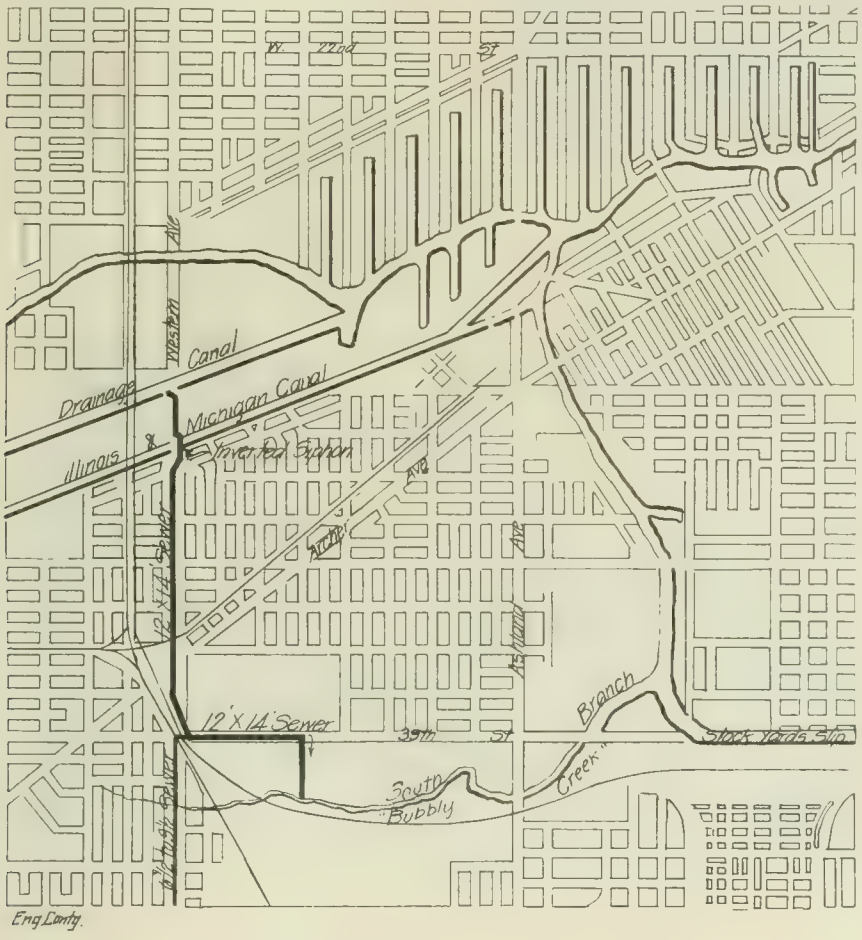

Fig. 1.—May Showing Location of Western Ave. Sewer and Branch from Bubbly Creek.

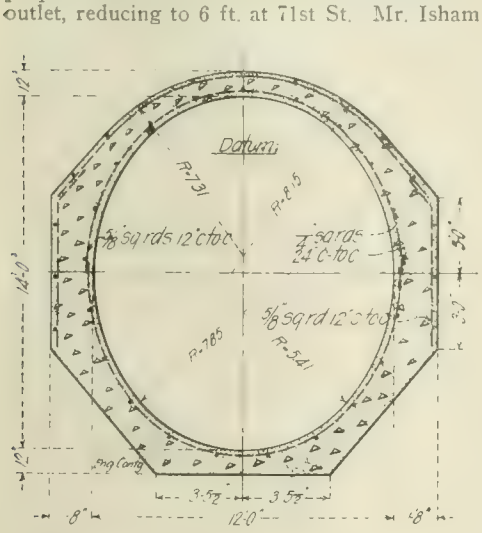

Fig. 2.—Section of 39th St. Sewer.

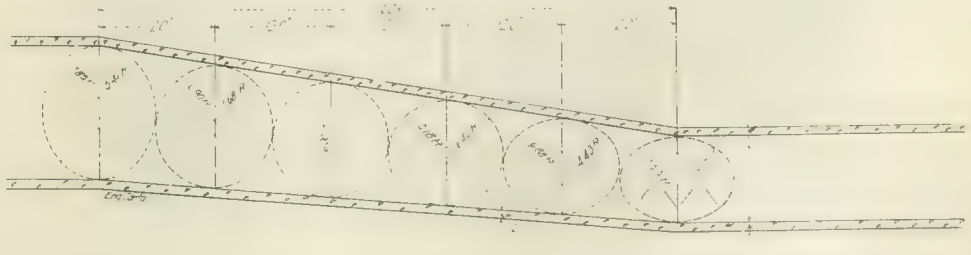

Fig. 3.—Half Longitudinal Section of Siphon Under Illinois & Michigan Canal.

building the main sewer presents some interesting features. The work was started from the siphon and carried south. At 35th St. the shovel has been 64 lin. ft. of excavation. This section averages 7¼ cu. yds. of clay per lineal foot. All back fill is taken directly

Fig. 4.— View Showing Derrick and Mixer Mounted on Same Platform.

considerable rock was encountered and some blasting had to be done. A steam drill was used and the loose rock was taken out in a skip handled with the derrick, shown by Fig. 4. This derrick is interesting for the fact that the same platform carries the concrete mixer used in placing the cement and both were furnished with steam from the same boiler.

The feature of the entire construction, however, is the use of a steam shovel in digging the trench. The trench is 16 ft. wide and about 26 ft. deep. A 7-ton Bucyrus shovel is mounted on rollers and straddles the ditch as shown by Fig. 5. To dig the required depth a 56 ft. dipper arm is used. In beginning the work, the excavation 9 ft. in depth was first taken out and the ditch was sheeted the entire length. The shovel was then backed up and proceeded to take out the balance of the cut. The sheeting consists of 2-in. plank with 4x10-in. stringers braced apart by 8x8-in. timbers fitted at one end with screw jacks. These braces are placed about 8 ft. apart. It will be seen that with these braces in the trench every 8 ft. it would be impossible for the steam shovel to work the second cut. To make this possible a frame is used. This frame is made of four 12-in. I-beams, two on each side of the trench, braced apart by two 8x8-in. timbers placed one at each end of the I-beams. The beams are 50 ft. long and the braces are fastened to them so that the entire frame can be picked up and carried ahead with the shovel. When the frame is set in the ditch it supports the sheeting against the

Fig. 5.—View Showing Steam Shovel and Machinery for Excavating 26-ft. Trench.

banks, and all other braces are temporarily removed leaving an open space in which the dipper can work. The best day's work for

from the shovel by the dump cars to the point of backfilling and dumped there. The shovel is operated by 3 men and is followed up by a gang of from 6 to 12 men (according to difficulties encountered) working under a foreman in the bottom, and 4 men on top. These men in the bottom trim the cut with grub-hoes to a templet placed by the engineer and replace all timbering and bracing, taken out to accommodate the shovel. They also look after all work of moving the shovel, and set the forms for the concrete as soon as the bottom part of the invert is laid.

The forms for concrete consist of 2x8-in. lagging held in place by ribs made of 6 in. channels, bent to fit the elipse. Altogether 320 ft. of forms are used. This amount is sufficient to allow the forms to remain in place the required 5 days and at the rate of maximum progress of 40 ft. a day allows plenty of forms for resetting. Two Chicago mixers, mounted in the same manner as the shovel in Figs. 4 and 6, are employed for the concrete work. One mixer, Fig. 4, follows directly behind the shovel and mixes and delivers the concrete to place in the lower half section of the sewer. The other mixer, Fig. 6, follows the first one, and, after the forms for the upper half section have been placed, delivers the concrete through a chute for this section.

The chutes are made in sections which consist of 10-in. diam. galvanized iron pipes, 3 ft. long and tapered ½ in. at one end to fit into the next section. They are fastened together by means of hooks riveted to the small end of one section and rings fastened to the large end of the next section. At the beginning of the work 8-in. pipes were tried as chutes but were replaced by 10-in. pipes on account of trouble caused by clogging.

Fig. 6.—View Showing Mixer and Mounting for Concreting Arch of Sewer.

One gang of men operates the two mixers and they are run alternately, first on the invert and then on the arch. This allows time for placing the arch forms and by the use of two machines, saves moving backward. The number of men in the concrete gang is about 20; fourteen men wheel the material from the street, two are on the platform to handle water and cement, one man at the chute and two dump men, and an engineer.

The walls of the sewer are 16 ins. thick and contain no reinforcement. The cubical contents is 2.2 cu. yds. to the lineal foot.

All labor employed is union labor and the working force on the main sewer consists of 60 men divided about as follows:

Shovel crew	3 men
Excavation	16 men
Rock filling	10 men
Concrete mixers	20 men
Derby engineers and laborers	6 men
Handling forms and sheeting	5 men

The force at work on the siphon consists of 22 men; also 20 men are employed on the dump in McKinley Park. This force, with the superintendent and office men consists of an average of 110 men.

The contract price for the concrete sewer is $28 per lin. ft. The siphon work is let at $60 per lin. ft. The contract calls for the completion of the work by Dec. 1, 1910.

It may be interesting to note in conclusion some facts regarding the operation of the new sewer by the Sanitary District. At present

the pumping station at the foot of 39th St. is diluting all sewage and is diverting it from the lake through a conduit on 39th St. to that branch of the Chicago River known as the stock yards slip. See Fig. 1. When the new sewer is completed the amount of lake water pumped in with the sewage will be increased to 1,000 ft. per second. The increased head caused by this amount of water will cause about 175 to 200 cu. ft. of water to pass through Bubbly Creek and into the sewer. This amount of flow will change the water in Bubbly Creek once in 16 to 18 hours. The condition of this place has been bad for so long that the accomplishment of a sanitary condition will be a great relief to that section of the city.

The Los Angeles Aqueduct: Structural Details, Economic Studies, Working Organization, and Service Constructions.

STRUCTURAL DETAILS.

The Los Angeles Aqueduct comprises six storage reservoirs and 217 miles of conduit. The capacity of the conduit is 430 second feet and the aggregate capacity of the six reservoirs is 638,893 acre feet. The purpose of the work is to collect and store the waters of the Owens River water shed in the Cascade Mountains and to convey this water to the head of the San Fernando valley near Los Angeles for distribution for irrigation and domestic purposes. The work itself is notable because of its size and its variety of conduit construction and because it is being carried out entirely by day labor. This article is an outline of the development and character of the work and of its management.

Reservoir System.—Gagings of the streams of the Owens River water shed show that a continuous flow of 400 second feet, or 20,000 miners inches, is available. This is closely 260,000,000 gals. per 24 hours. This flow is not regular; there are years when it greatly exceeds the figure named and other years when it drops considerably below it. Neither is the flow regular throughout any year, there being a wide range between maximum and minimum monthly flow. To secure the maximum available supply then requires that the flow be regulated by storing the excess flow of certain periods to make up for the deficient flow of other periods. Two storage reservoirs were planned, one to furnish yearly regulation and another to furnish monthly regulation.

Yearly regulation is provided for by a reservoir in Long Valley near the headwaters of the Owners River. This reservoir will impound the excess discharge of years of excessive flow and hold it for years of deficient flow. With a dam 140 ft. high the capacity of Long Valley Reservoir is 260,000 acre feet. By adding 10 ft. to the height of the dam an additional storage capacity is had of 44,980 acre feet. In years of deficient flow the water in this reservoir will be fed into the Owens River in such quantities as may be necessary to maintain the required average yearly flow.

To regulate monthly variation in flow a second reservoir known as the Haiwee Reservoir will be constructed at a point about 60 miles below the conduit intake from the Owens River. The location of this reservoir is shown on the profile Fig. 1. The Haiwee Reservoir will have two dams, one at the upper end and one at the lower end of the long narrow valley which it occupies. With a lower dam 80 ft. high its capacity will be 63,800 acre feet. The continuous draft from this reservoir will be 430 second feet and 63,800 acre feet will supply this draft without receiving any inflow for 2½ months.

The two reservoirs described are all that are required for the regulation of the flow from the Owens River water shed, that is, they will assure the continuous delivery of 400 second feet of water through the conduits regardless of monthly and yearly variations in supply. To regulate the distribution of this conduit flow, however, distributing reservoirs are essential, and two are provided, known as San Fernando Reservoir, Numbers 1 and 2. The capacities of these reservoirs are, respectively, 15,900 acre feet and 21,050 acre feet, or a total of 36,950 acre feet. This is sufficient to supply 100 gals. per capita per day for four months to a population of 1,000,000. The function of these reservoirs is nominally to regulate the difference between supply and consumption. The supply to the reservoirs is constantly 400 second feet; the consumption is in excess of this in summer and less than this in winter. They also insure an adequate supply of water should the flow through the aqueduct be for any reason cut off.

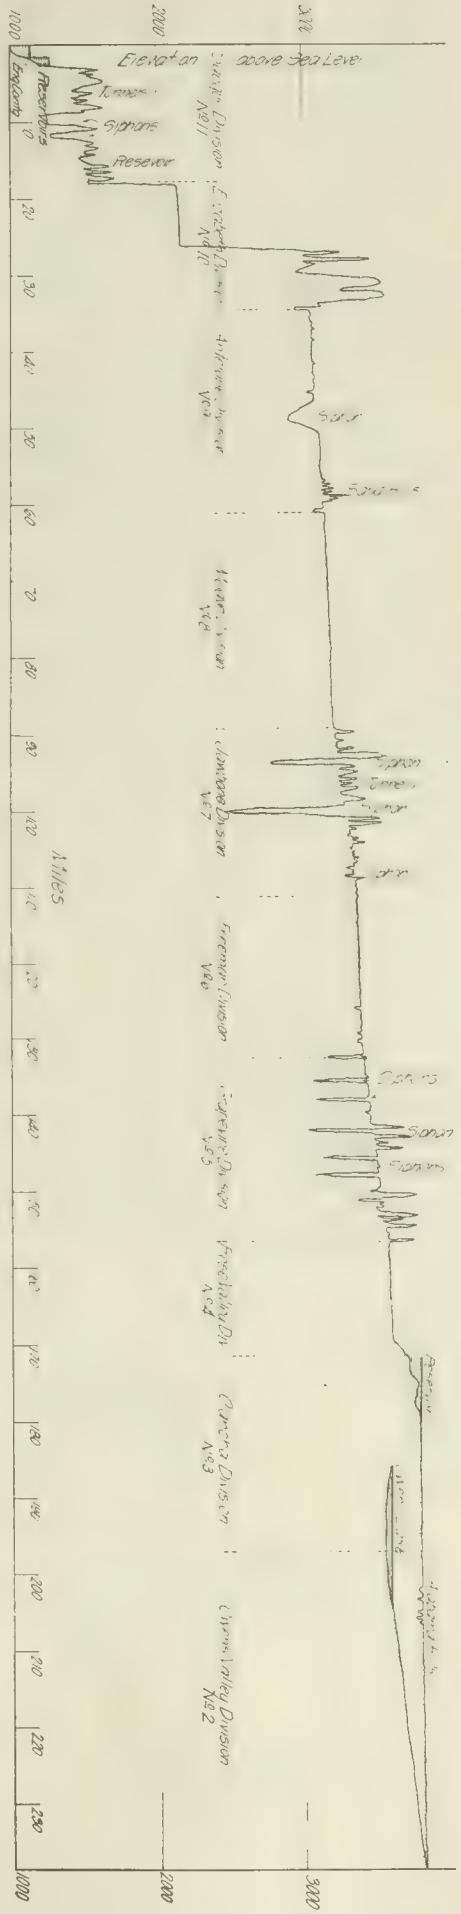

Fig. 1.—Profile of Los Angeles Aqueduct.

The Long Valley, Haiwee and San Fernando reservoirs are sufficient for water supply proper. As will be noted from the profile Fig 1, there are, however, two other reservoirs. These are introduced solely for the subsidiary purpose of power development, which is being worked out in conjunction with the work of water supply. Referring to the profile Fig. 1 it will be seen that there is a sharp fall in the line beginning at about Mile 25. It is in this drop that the main head is available for water power. The conduit from the Haiwee Reservoir has a capacity of 430 second feet; the consumption for power purposes will vary from 80 second feet to 1,000 second feet. By placing a reservoir at the head of the power conduit line and another at its lower end it will be seen that the uniform flow of 430 second feet can be changed to variable flow through the power conduit, and this variable flow changed again to uniform flow below the second reservoir.

The reservoir located at the head of the power conduit is the Fairmont Reservoir and, with a dam 105 ft. high, has a capacity of 7,620 acre feet. The power conduit extends from the south portal of the Elizabeth Tunnel to a power house in San Francisquito Canyon. The gross drop of head is 890 ft. From the tail race of this first power house the power conduit will extend to a second power house, with a net drop of head of 578 ft., and from the second power house tail race the conduit will reach to Dry Canyon Reservoir, having a capacity of 1,325 acre feet, with a dam 55 ft. high. The power conduit from Fairmount Reservoir to Dry Canyon Reservoir will have a capacity of 1,000 second feet.

The preceding description explains the nature and purpose of the several reservoirs. Their construction will necessitate the construction of seven dams. Table I. shows the dimensions of these dams and summarizes other facts concerning the reservoirs. All the dams, with the possible exception of that at Long Valley Reservoir, will be hydraulic fill dams with masonry core walls.

Conduit Line.—The conduit line may be divided into: (1) diversion conduit, (2) main conduit, and, (3) power conduit. Each division is composed of varying lengths of the following types of aqueduct: (1) unlined open canal, (2) lined open canal, (3) lined and covered canal, (4) tunnel, (5) inverted siphons and (6) flumes. The total lengths of aqueduct of the several types are as follows:

Kinds.	Feet.	Miles.
Unlined canal	111,200	21.08
Lined canal	[illegible]	152.25
Rock tunnels	91,019	17.24
Earth tunnels	58,508	11.08
Siphons	74,847	14.19
Flumes	9,050	1.72
Total	[illegible]	217.56

Taking up first the main divisions of conduits, we have first the diversion conduit from the intake in Owens River to the Haiwee Reservoir. This conduit is virtually a new channel for Owens River, and it has a capacity of 800 second feet at the intake and gradually increases to a capacity of 900 second feet at the reservoir, this increase being provided to accommodate the water coming from tributary streams below the intake. In construction the channel will be unlined canal for approximately 21 miles and of lined canal for the remainder of the 60 miles of length.

The sections at various points are shown by the drawings of Fig. 2 The construction quantities per lineal foot of canal for the various sections shown are:

Section.	Excavation. Cu. yds.	Concrete. Cu. yds.
Intake to Alabama Hills.....	14.81	....
Ala. Hills to Cottonwood Creek.	10.31	1.02
Cottonwood to Haiwee	11.28	1.07
Alabama Hills	9.58	0.77

The main conduit extends from Haiwee Reservoir to Fairmont Reservoir, 138.15 miles, and from Dry Canyon Reservoir to San Fernando Reservoir No. 1, 11⅞ miles. The break from Fairmont Reservoir to Dry Canyon Reservoir, a distance of 19.2 miles, is called power conduit, as it is an essential part of the power development as previously stated.

The various structural sections adopted for main conduits are shown on Figs. 3, 4 and 5. It will be seen that in addition to divisions of the main conduit type, as tunnel, canal, etc., further subdivision was made into sizes. The capacity is in all cases 430 second feet and the relative size of each type is controlled by the gradient or fall it will have. These sections were designed in the office of the chief engineer and the estimated cost for each type for varying conditions of typography and soil was determined by the chief engineer. Flume and siphon construction are not shown on Figs. 3, 4 and 5; they may be described as follows:

Siphons will be U-shaped pressure pipe which will carry water across canyons or valleys wherever they prove to be more economical than it would be to build a canal following the contour around the depression. They will be rivetted steel pipe with a minimum thickness of ¼-in. and a maximum thickness of 1 in. Altogether there will be 74,847 lin. ft. of siphons on the aqueduct.

Flumes are located over shallow depressions where the maximum depth is not more than 30 to 40 ft. Most of them will be fabricated from steel plates and angles arranged to form an effective canal section, and at the same time to be a self-supporting girder bridge. Where the cost of forms does not run too high reinforced concrete will be substituted for steel.

ECONOMIC GRADIENT AND CROSS SECTION STUDIES.

The controlling elevations of the aqueduct, as will be seen from the profile Fig. 1, are: (1) Black Rock Springs, fixing the intake in the Owens River at an elevation of 3,814.8; (2) Haiwee Reservoir, at an elevation of 3,760, to insure sufficient capacity for seasonal regulation; (3) Fairmont Reservoir, at an elevation of 3,035; (4) San Fernando Reservoirs. For the 60 miles of diversion channel there is, therefore, a fall of 54.8 ft., which gives an average gradient of 0.91 ft. per mile or 0.173 ft. per 1,000 ft. This gradient is rigidly fixed by nature. The conduit was given a grade of 1 ft. per mile from the intake to the south end of the Alabama Hills, and a grade of 0.15 ft. per 1,000 ft. for the remaining distance.

For the remainder of the conduit careful studies were made to determine economic gradients and cross-sections. It is evident, since the aqueduct passes through all kinds of country and includes various types of conduits, that it would not be good engineering to use the same gradient for the entire length. There is evidently some distribution of gradients required for the different types of conduit and the various kinds of material encountered which will make the combined cost for the total distance a minimum. To determine these gradients unite construction costs were estimated for each type of construction for various grades. It is evident that the steeper the grade the smaller and hence cheaper the conduit

section. The assumed slope multiplied by the total length of each section gives the total head or fall, and the unit cost multiplied by the length gives the total cost. These data for each section were platted as curves, designated as gross cost curves. The more

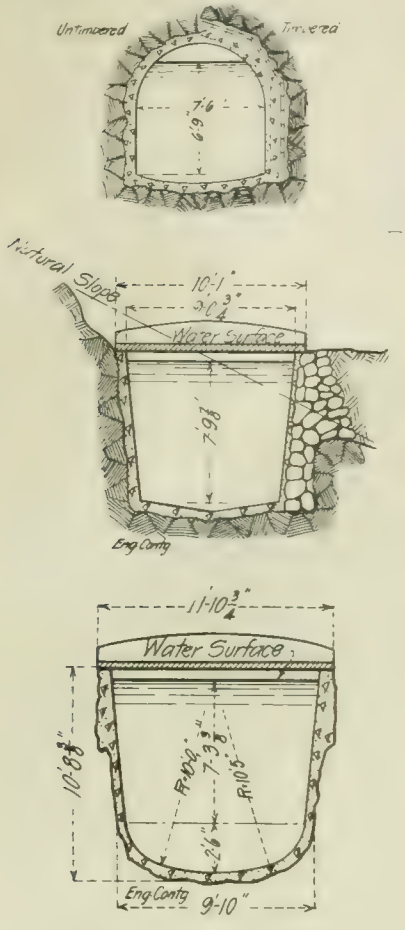

Fig. 5.—Sections of Los Angeles Aqueduct on Rose Valley, Grapevine and Freeman Divisions.

head that is consumed in any gradient for any given section, the higher in elevation the portion of the line above must be located. Where these upper portions are situated on steep hills, there will be a corresponding increase in construction cost, due to the increased cost of hoisting materials. In addition a raise in grade elevation may increase the pressure head on all siphons above the portion of line in question. These charges were computed and added to the gross cost curves, giving net cost curves, showing the relation between total head and total cost for each section of aqueduct. The diagram Fig.

work. The cost reports that are being furnished at the present time consist of a "Ten Day Cost and Progress Report" and a "Monthly Cost and Progress Report," which are similar as to form. As the title of the former report would indicate, it is rendered at the close of the tenth, twentieth and last days of each month. Engineers are expected to forward their report promptly at the close of each period; and in the interests of promptness, they are permitted to sacrifice a certain amount of accuracy; but the monthly report, which is a summary of the ten-day reports, must be prepared accurately. One of each of these reports is required for each engineer's work order upon which work is being prosecuted. These reports are transmitted by the engineer in immediate charge of the work to the chief engineer through the office of the division engineer. They are filed for reference in the chief engineer's office; and upon the completion of the engineer's work order, a detailed statement of the cost is prepared and furnished to all engineers interested. At the end of each month a total monthly cost and progress report is prepared in the office of the chief engineer and forwarded to the Board of Public Works, showing the total cost and progress of all work orders under construction during the month.

Housing Employes and Live Stock.—To house the several thousand persons employed on the work and to shelter stock and tools there are required some 500 buildings. These buildings include lodgings, dwellings, offices, mess houses, hospitals, warehouses, shops, etc., and are both of fixed and portable construction.

The climate along by the aqueduct varies from the intense summer heat of the desert, when the thermometer reaches 110°, to a temperature of 10° and 20° above zero in winter. The effort was made to make the lodgings comfortable in both summer and winter as far as consistent with proper economy. The bunk houses for the laborers are made to accommodate two men to the room. Each room has an outside window. The cost of these buildings is about $25 for each man housed. Four-room dwellings are erected for the division engineers, who pay a monthly rent sufficient to return the investment. These dwellings each cost from $600 to $900, depending upon the location and the cost of hauling the material. A building which will cost $600 in Los Angeles will cost $800 erected at South Portal or Grapevine, on account of the long wagon haul.

Medical Service.—Besides housing the several thousand employes, medical and surgical attendance is provided, for which the men are taxed $1 per month for those receiving $40 per month and 50 cts. per month for those receiving less. Except for certain diseases the men get free medical service. A camp or tent hospital is provided at every camp, a field or division hospital at each division headquarters and a general hospital at Los Angeles. The medical corps also oversees sanitation of camps, etc.

SERVICE LINES AND POWER.

The length of the conduit and its out-of-the-way location made necessary the provision of transportation lines, telephone communication, water supply and power plants. These various services are briefly described as follows:

Transportation.—The economical transportation of materials necessary for the construction of the aqueduct, from a financial standpoint and next to the actual consideration of engineering difficulties, forms one of the most important factors of the undertaking.

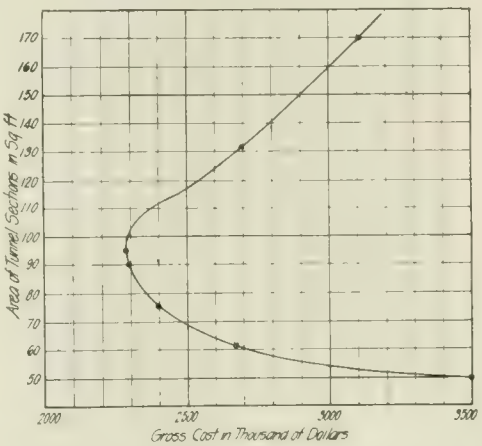

Fig. 8.—Diagram Showing for Elizabeth Tunnel Variation of Gross Cost With Areas of Cross Section.

The aqueduct, throughout the major portion of its length, traverses the most arid part of Southern California. The country is sparsely settled and, until this time, has been unable to offer substantial inducements to common carriers.

It being apparent that methods other than ordinary wagon haul must be adopted for the conveyance and prompt delivery of material and supplies, estimates were made by the engineers of the Los Angeles aqueduct for both narrow and broad gage railroad lines, practically paralleling the proposed conduit location from the south side of Antelope Valley to within 10 miles of the intake on the Owens River, on the basis of hauling 287,500 tons of through and 1,500,000 tons of local freight, together with such traffic as might accrue from contiguous territory. It was shown by these estimates that, in the event of no satisfactory bids being received for the construction of such railroad, the aqueduct could construct and maintain such a line, salvaging all track and operating material at the end of five years, and still reduce transportation charges from 25 cents, an average cost of desert haul, to less than 10 cents per ton mile. With this possible end in view, surveys were made from Antelope Valley to the proposed upper terminus in the Owens Valley.

California & Nevada Railway.—Advertisement for bids for the transportation of approximately 320,000 tons of freight from Mojave, north to various stated points adjacent to the proposed aqueduct location, was made by the Board of Public Works, April 2, 1908. The accompanying specifications provided for the construction and operation of a standard gage steam railroad along a certain defined route, and established a definite time of completion. A contract was made on the 22nd day of the same month with the Southern Pacific Co., agreeing to such conditions, and specifying a distance tariff on all tonnage according to the western classification. This road is called the California & Nevada Ry.

For the purpose of serving the south end of the Freeman Division and Section 1 of the Jawbone Division a spur line was constructed.

Prior to the completion of the California & Nevada Ry., all materials necessary for the preliminary construction and commissary supplies were transported by wagon haul from the Mojave warehouse north to the various camps. These materials included all lumber for bridges and buildings, pipe and fittings for water supply; cement, tools and powder for the building of roads and trails; wire, poles and hardware for both telephone and transmission lines; and all supplies necessary for the subsistence of from 200 to 1,000 men. With such volume of freight it was found both economical and expedient to advertise for bids for wagon transportation on the basis of main and branch road haul, the former item to embrace haul on the stage road from Mojave north, and the latter to apply to haulage from such main road over all branches feasible for travel with well-broken freight teams. A contract was entered into Dec. 30, 1907, specifying a net price of 28 cts. for main road and 30 cts. for branch road haul per ton mile. This contract called for the distribution of approximately 1,000 tons of freight. A contract was also made Dec. 11, 1907, for a number of freighting outfits, the same being compensated for at certain prices for six, eight and ten-animal teams. A further contract, dated Sept. 18, 1908, has been made for the hauling and loading of gravel and other material. This contract was designed chiefly for the transportation of cement and gravel on the Mojave Division.

In the effort to reduce the cost of wagon haul below that of ordinary team transportation, trials have been made of traction engines of various design. It was found that the familiar types of engines, with comparatively narrow wheel treads, were useless in the deep dust and sand of desert roads. A special type, however, called the "Caterpillar" or "Paddlewheel" engine—so designated from the peculiar construction of its rear and propelling wheels—has been placed in service with good results.

This engine, instead of having the large hind wheel commonly known, carries its weight on five truck wheels which run on a track of plow steel, so protected that it is nearly impossible for sand to reach the bearings. The hind wheels are of the sprocket type and engage an endless belt of "shoes" or "platforms" which pass around the sprocket and center wheels, 78 ins. distant, the latter acting as idlers. These platform wheels have the same tractive area as an ordinary round wheel, 54 ft. in diameter.

While manufactured for either steam or gasoline power, the latter has been found best adapted for use on the aqueduct. The motor used is of the four-cylinder, vertical, water cooled type, with 6x8-in. cylinders, developing 40 brake h. p. at 550 R. p. m. Distillate is used for fuel at a cost of less than 1 ct. per h. p. hour.

The capacity of these engines naturally varies with the grade. Loads of from 15 to 20 tons are possible on level roads. Specially built trucks capable of carrying from 6 to 10 tons are used. Compressors, transformers and other heavy machinery, weighing from 7 to 10 tons, are easily transported over grades of loose sand ranging from 12 to 20 per cent,

TABLE II.—SHOWING FRICTION HEADS AND ECONOMIC SLOPES FOR VARIOUS TYPES OF CONDUIT, LOS ANGELES AQUEDUCT.

Total	728,310	495.25		24.40

and around the sharp curves of mountain roads. Ordinary wagon transportation of such loads under like conditions would be an impossibility.

Accurate cost data has been kept of the performance of these machines, together with team haul, for the purpose of comparison. Recent work in the Jawbone and Mojave section shows an average ton mile cost of 20 cts. for engine haul, against an average of from 40 cts. to 50 cts. for team transportation.

Water Supply.—Water supply for camp and construction purposes has been developed from streams, springs and wells as sources by installing pumps and reservoirs and pipe lines extending along the work.

Telephone Line.—The main telephone line extends from Los Angeles to the intake of the aqueduct and is 240 miles along, not including several branches. For some 22 miles the poles are rented, but for the remainder of the distance the standard construction consists of two No. 10 bare copper wires, supported on oak brackets on 4x6x18-ft. redwood poles spaced 160 ft. These poles are from the butt cuts of selected redwood. The estimated cost for the first 22 miles was $95 per mile and the actual cost $101 per mile. The average estimated cost for the various sections of the remaining 208 miles was $232 and the actual cost $188, which includes estimates, plans, location and supervision. Western Electric Co. five-bar, 2,500-ohm long distance telephone sets and protectors are used and cost about $16.50 for each complete installation.

Power Development.—Preliminary estimates and study showed that, for those sections in which the work is heavy and the power requirements considerable, electrical energy could be generated at certain central points and delivered at the work at a lower cost and with more satisfactory results than could be realized by the distribution of the necessary generating machinery and fuel along the line. It was further shown that hydro-electric power could be developed along the Division Creek and the Cottonwood Creek and delivered to all points from the intake in the Owens Valley to the south end of the Jawbone Section, giving reliable power at from one-quarter to one-third less cost than it could be furnished in any other way. In each case, interest on the investment and total depreciation of the systems, with the exception of a reasonable return from the machinery and copper were included in the costs.

The power systems determined upon, and which are either completed or the necessary machinery and materials contracted for, consist of three hydro-electric plants and 188 miles of 33,000-volt transmission lines, with 20 transformer stations, some of which are portable. The generating plants are Division Creek No. 1, Division Creek No. 2 and Cottonwood Creek, with a total continuous capacity of 2,600 k. w. at the switchboard and which can be expected to deliver under actual conditions of operation and of load, an amount equivalent to 2,100 k. w. continuously or for 24 hours per day through the year. These plants will furnish power at all points from the intake to the Pinto Hills, or south end of the Jawbone Division, which district is covered by 146 miles of main transmission line and 6 miles of branch lines in the Jawbone Tunnel Section. The remaining 36 miles of transmission is near Saugus, reaching all points from the south portal of the Fernando Tunnel to the north portal of the Elizabeth Tunnel and connecting from the Castac substation of the Edison Electric Company, from which company power is purchased for this part of the work.

Approximately 26 miles of the 36 miles of 33,000-volt, 3-phase transmission line near Saugus was completed Aug. 1, 1908, reaching the portals of the Elizabeth Tunnel. This line is built of 30-ft. cedar poles, an average distance of 200 ft. apart, one 6-ft. and one 15-in. cross-arm per pole, supporting three number 4 solid copper wires on 7-in. two-part porcelain insulators. The estimated cost of this line was $881 per mile, and though the line was built in bad weather during February and March, the actual cost was kept within the estimate, or $868 per mile. This cost includes all engineering, location and brushing.

For the main line, 106½ miles south from Cottonwood, and 6 miles of branch line in the Jawbone Division, the construction is the same as for the lines near Saugus, except that because of the excessive haulage cost and the temporary character of the line a special 28-ft. pole, built up of lumber and spaced 175 ft. is used. The estimated cost was $994 per mile and the actual cost $795. This line was built in good weather by energetic line foremen and good men. The cost includes all location and supervision.

Conclusion.—The foregoing is an account of the structural features of the Los Angeles Aqueduct and of the plans and service constructions that have been developed for prosecuting the work. Methods of construction and costs will be given for typical classes of work in future issues as material develops. As an example we give in this issue a description of the methods and cost of lining a section of covered conduit, using a special collapsible form. Similar costs and methods of particular pieces of work will be published from time to time. The work as described is being done under the direction of William Mulholland as chief engineer and J. B. Lippincott as assistant chief engineer by day labor. Over 6,000 men are employed, and the pay roll is some $300,000 per month.

Method of Stream Gaging by Use of Rod Floats with an Outline of the Reductions.*

The example given is that of gaging the French Broad River, near Asheville, N. C., in November, 1896. The place chosen was a fairly straight section of the river, and reasonably free from the influence of obstructions. This being a mountain stream of small depth and steep slope, a place was chosen where the water was deep and the local slope light. At that stage, which was considerably above low water, the river had a surface width of about 350 ft. A base line 200 ft. in length was laid off on the right bank as near to the water and as nearly parallel to the main thread of the stream as practicable. Three sections or ranges were laid off at right angles to the base line at either end and from middle point, and were marked by range flags on either shore. The sections were sounded with a 12-ft. pole shod at lower end and graduated to feet and tenths from a boat rowed slowly across the stream and against the current, upon the marked range. The soundings were taken as nearly as possible at equal intervals and were located in the following manner: With transit set at intersection of base line and range, and with stadia rod held in boat abreast of sounder, the stadia distance was read off direct. In lieu of a stadia, a level rod might have been used for this distance, but either should be inverted in order that one wire of the instrument might be kept at the zero point of the rod. Not much practice is required to catch distances at a glance with a considerable degree of accuracy. With a recorder at the instrument, every sounding may be located, but with a reasonably regular bottom the location of every alternate sounding will suffice.

Rod floats, 1 ft. to 5 ft., had previously been prepared and adjusted to differ in submerged length by 6 ins., having each a freeboard of about 2 ins. The rods were of white pine 1½ ins. in diameter, and were weighted by lead pipe of some external diameter fitted at the lower end. Final adjustment for submersion of rod was made with shot held in the lower end of the pipe with a plug. The rods were fitted with a staff of No. 10 wire, some of 8 ins. long, carrying a flag some 6 ins. square, by means of which the rod could be kept in view. Any light material or a section of tin pipe might be used for a float, and it might be ballasted with an iron bolt. Whether its length is an even unit or if it projects a considerable distance above the water is immaterial, so long as it is not affected by the wind. It is not necessary to have so many rods, or that they float so near the bottom of the stream, so long as we have the data for reducing from rod velocity to mean velocity, through wide variations. The writer has gaged a stream of 800 ft. in width and from 3 to 15 ft. in depth, with only four lengths of floats.

In the French Broad gaging in question the rods were run across the ranges about every 30 ft., or as near that spacing as it was convenient to place them without undue delay. From inspection of sections the longest rod was started in each case, which it was presumed would float without touching the bottom. If a particular rod struck bottom the flag announced that fact, the observation was canceled and a shorter rod started. With transit on base line at upper section and with stadia rod held in boat as for sounding, the boat was placed in the approximate thread of the stream some 15 to 20 ft. above the range. The float was dropped from stern of boat and started on its trip. The second of crossing the upper range line was noted and recorded. The stadia distance to the boat, which was made to follow the road only as far as this range, was then noted. An assistant preceded the rod to the lower range, 200 ft. away. As it approached that range he called out "stand by," and at the instant of crossing he called "mark," the time being noted and recorded. The rod being followed by the transit, its angular position with reference to the base line at the instant of crossing the lower range was determined. At the signal from the shore the rod was picked up by the boat and returned to its starting line. To facilitate the recovering of the rod a light linen or silk line was made fast to its upper end and paid out freely from the boat, which was kept well above and to one side of the rod during its run.

All of the notes of this survey not given in the first six columns of Table I are shown graphically upon the accompanying diagram. The basis of the diagram is a plan of the base line and the ranges, with the water lines of the river. With the range lines as water surface lines, cross sections of the river were constructed from the sounding noted. Sections of the river at upper, middle and lower ranges are shown by the polygons *U u u U'*, *M m m M'* and *L l l L'*, respectively, in light full lines. The paths of the twelve floats were platted from notes in columns 3 and 4 of Table I. It will be noticed that all of the floats in this particular case inclined more or less toward the base line, showing that line not to have been located parallel to the average thread of the current. This or any reasonable inclination of float paths does not affect the accuracy of the results obtained, since the increased distance run is inversely proportioned to decreased perpendicular distance between their paths. The depths of the stream, perpendicularly below the intersection of each path with the range lines, are then scaled, and a fourth cross section is constructed on the middle range, from depths which are the weighted means of the depths of the three intersections. This mean depth is taken as ¼ the sum of the upper depth, the lower depth and twice the middle depth. This mean section is shown by the polygon *M 3M 7M 11M M'*, in a dashed line thus: — — — — —, and these depths are entered in column 9 of table. The time of passage of floats over this 200-ft. stretch of river is then deducted from the difference between columns 5 and 6 of table and entered in column 7. The velocity of float in feet per second is then computed and entered in column 8.

This brings us to a consideration of the reduction from the velocity of the rod as run to the mean velocity of that thread of the stream from the surface to the bottom. The accompanying formula for such reduction is that

*Extract from a paper by Geo. W. Brown in the "Wisconsin Engineer" for April, 1910

given by Mr. Francis in his Lowell Hydraulic Experiments:

$V_m = V_r\ [1 - 0.116\ (\sqrt{D} - 0.10)]$, in which

V_m = mean velocity for full depth,
V_r = observed velocity of rod float, and
D = depth of stream below bottom of rod / depth of stream,

D = The percentage of the depth of the stream which is below the bottom of the rod.

The above formula is strictly true when the bottom of the rod is approximately 5 per cent above the bottom of the stream, and should not be used without modifications when it is more than 10 per cent above the bottom. The writer has made experiments to determine what modifications could be used in such cases. In a stream 12 ft. in depth, five rod floats ranging from 7 to 11 ft. in length were dropped into the same thread of water from a boat anchored in the stream at a point above the upper range and some two or three seconds apart. The passage of these rods across the ranges was noted and recorded. The rods were picked up by a second boat, returned to the starting point, and were run over and over again, in order to eliminate local effects as far as possible and to secure a mean velocity for the thread of the stream. The mean of the several observed velocities for each float was taken as the mean velocity of the stream for the depth to which the float extended. Such a modification of the Francis formula was required that the mean velocity for the full depth might be determined from the mean velocity of the shorter floats. It was found that within the range in question—that is, when the distance below the bottom of the rod was no more than one-third of the depth of the stream—the value of V_m would be given with a great degree of accuracy by substituting a variable for the quantity ".10" in the last term of the formula. This term was found to increase algebraically about one per cent for every one per cent increase in the value of D. With the term "-.10" correct then D equals 5 per cent, the terms within the parenthesis will vary as follows:

$\sqrt{.05} - .10$; $\sqrt{.10}$ 0.05; $\sqrt{.15} - 0.00$; $\sqrt{.20} + 0.05$; $\sqrt{.25} + 0.10$; $\sqrt{.30} + 0.15$; $\sqrt{.35} + 0.20$.

in the .20. In the French Broad gauging the values of D varied from 7 to 33 per cent and the consequent corrections to $\sqrt{D}$ varied from + 0.18 to — 0.08. These corrections are given in column 10 of table. The corrections to V are given in column 11, and the value of V_m in column 12. In column 13 is shown the discharge for one foot in width of stream in cubic feet per second; the product of the mean depth (Col. 9) by the mean velocity (Col. 12).

With the middle range line of diagram as a base the various mean velocities are platted in vertical ordinates immediately under the intersection of that line by the corresponding floats. These points being connected with each other and with the middle range at shore lines (as shown in dash and dot line), gives the curve of mean velocities. Upon the same base line, and with convenient scale, volumes of discharge (Col. 13) are laid off in vertical ordinates, and being connected with each other, and with the base line gives the discharge polygon, the area of which, interpreted by proper scales, gives the discharge of the stream in cubic feet per second. It will be observed that, in a general way, the mean velocity and discharge polygons are parallel to the curve of mean depth. The area of the discharge polygon can be determined with a planimeter, or from cross-section paper, or it can be computed directly.

The field work of the gaging in question began after 8 o'clock in the morning, and was finished at 11:30 a. m., by a party consisting of a chief, a recorder, one boatman and two helpers. The work was reduced and platted, and the results obtained by the chief of party and his recorder in less than an equal length of time.

Three or four gagings of a stream at low, mean and high stages, will afford a diagram by which its discharge may be determined for any reading of the river staff. For stream gaging, this method affords sufficient accuracy, since the uncertainties of the volume thus obtained are very much less than the uncertainty of the particular stage of the stream, with reference to its high, low or medium stage.

The method of stream gaging with rod floats is better adapted to deeper than to shallower streams, to a limit of 18 to 20 ft. in depth; and is applicable to widths up to 800 or 1,000 ft. Rod floats are also adaptable to tidal streams of reasonable depths, but the methods of use and of the reductions are not so simple as in the case given.

Wages in the Building Trades.—A late report by the Board of Trade showing the earnings of laborers in the building and wood working trades in the United Kingdom is summarized as follows by Consul Benjamin F. Chase of Leeds: The total number employed in these trades in 1906 was about 1,250,000, of which about 1,000,000 belong to the different branches of the building trade. The average net earnings per man during that summer were $7.66 per week. The average full time earnings of all men were $8.03, for skilled workmen $8.84, and for ordinary labor $5.94. In the harbors, docks, sewers, etc., the average full time earnings of men were $7.74. In the saw mills, machine joining and box and packing case making industries, $6.59. In cabinet making and allied trades, $8.03. The average wage in the building trade has advanced about 18 per cent since 1886. In Leeds the hours of labor and rate of wages in these trades in 1909 were as follows:

Employment.	Hours	Rate.	Overtime.
Bricklayers	49½	$9.53	1¼ to 1½
Cabinetmakers	49½	6.60	1¼ to 1½
Joiners:			
Summer	49½	9.03	1¼ to 1½
Winter	41½	7.57	1¼ to 1½
Plasterers	49½	9.53	1½
Plaster laborers	49½	7.02	1½
Plumbers	49½	7.57	1¼ to 1½
Polishers	52½	8.51	.....
Slaters and tilers	50	9.12	.....

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Cost of Operating the New York City Railway Co. Lines—218 Miles of Electric Street Railways.

This company operates 70 per cent of the surface railways of Manhattan. The following data relate to the fiscal year ending June 30, 1908, during the last nine months of which the company was in the hands of a receiver. The cost of operation was very high, due mainly to unusual expenditures for maintenance, but partly to poor management. About 10 per cent of the car mileage was operated by horses and the rest by underground electric contact (conduit system). Unfortunately the published cost records do not separate the cost of horse operated mileage from electric operated mileage, nor is statement given of the exact car mileage of each. However, the number of horses is given and we can closely approximate the horse car mileage, for it is a well-established fact that street car horses average 14 to 16 miles per day.

Another confusing feature exists in the fact that 28 per cent of the electricity generated was sold; but this credit needs only to be borne in mind to avoid a misinterpretation of the statistics.

We shall first give a detailed statement of the track mileage operated and the plant, as of June 30, 1908:

	Miles.
Road, first track	112.0
Second track	106.1
Total trackway operated	218.1
Sidings, turnouts, storage tracks, etc.	17.4
Total track	235.5

There were operated by this company 76.5 miles of double track electric line (underground contact) and 26.7 miles of double track horse car line.

The rolling stock was as follows on June 30, 1907:

	Motor.	Non-motor.
Closed passenger cars	1,804	128
Open passenger cars	863	131
Combination passenger cars	80	...
Total	2,747	259
Express cars	30	...
Freight cars	4	...
Service cars	40	17
Snow plows	7	10
Sweepers	65	30
Grand total	2,893	316

During the year 1908 the company installed 276 new passenger cars and withdrew 999 old passenger cars, but the following statement of rolling stock, as of June 30, 1908, does not check very well with the above statement:

	Motor.	Non-motor.
Closed passenger cars	1,184	596
Open passenger cars (incl. horse cars)	714	...
Total passenger cars	2,898	596
Express cars	6	12
Snow plows	5	10
Sweepers	67	21
Work cars	49	19
Grand total	3,025	658

The report for 1907 gives the maximum weight of passenger cars at 11 tons and the maximum length at 40 ft. The report for 1908 gives the average seating capacity at 36 passengers per car.

The power plant was as follows:

Station Equipment:	Rate of capacity.
80 boilers	21,050 HP.
11 steam engines	55,000 HP.
11 generators (direct, A. C.)	38,500 KW.
2 station transformers	750 KW.
6 exciters	1,280 KW.
Substation Equipment:	
30 rotary converters	30,720 KW.
93 transformers	35,925 KW.
662 storage battery cells	4,160 amp. hrs.

There were 2,185 horses.

The traffic statistics were:

Passenger car miles	50,637,061
Express and mail car miles	114,684
Work car miles	132,297
Passenger car hours (estimated)	7,724,247
Passenger car miles per mile of trackway	262,300
Pasengers at 5 cts.	308,376,992
Passengers at 4 cts. and 3 cts.	4,613,960

There were 6.16 passengers per car mile, or 46.55 passengers per car hour. The average speed was 7.56 miles per hr. There were 232,300 passenger car miles per mile of trackway (218 miles). Although there were nearly 3,500 passenger cars, the mean number in use was reported to be 2,856, and they averaged 17,800 miles during the year. Since there were 2,792 conductors, it is doubtful whether the average number of cars in use was as many as reported.

General Office Staff:
- 8 general officers.
- 29 other officers.
- 404 employes.
- 441 Total general office.

Transportation:
- 113 starters.
- 4 register takers.
- 2,792 conductors (319 on horse cars).
- 2,540 motormen.
- 331 drivers (horse cars).
- 130 switchmen and yardmen.
- 1,621 road and trackmen.
- 122 station porters and watchmen.
- 100 other employes.
- 294 hostlers, stablemen, etc.
- 8,131 Total transportation.

Power:
- 9 engineers.
- 41 oilers.
- 19 wipers.
- 20 firemen.
- 17 coal passers.
- 18 water tenders.
- 15 ashmen.
- 16 boiler cleaners.
- 34 dynamo and switchboard men.
- 56 electricians.
- 296 linemen.
- 155 other employes.
- 696 Total Power.

Car Houses and Shops:
- 112 car cleaners.
- 23 car oilers.
- 678 other car house employes.
- 163 carpenters.
- 37 blacksmiths.
- 70 machinists.
- 20 armature winders.
- 150 electrical helpers.
- 135 painters.
- 276 other employes.
- 1,664 Total Car Houses and Shops.

10,932 Grand Total Employes.

In 1907 the average number of employes, including officials, was 8,816, and they received $6,682,276.

The operating expenses were as follows, first giving the totals and then the costs per car mile:

Maintenance of Way and Structures:	
1. Track and roadway	$ 858,734
2. Electric line	265,903
3. Buildings and fixtures	159,731
Total Maintenance of Way	$1,284,368
Maintenance of Equipment:	
4. Steam plant	$ 92,467
5. Electric plant	54,715
6. Cars	950,128
7. Electric equip. of cars	1,060,123
8. Miscel. equipment	48,798
9. Shop expense	68,817
10. Renewal of horses, harness, etc.	192,435
Total Maintenance of Equip.	$2,467,483
Operation of Power Plant:	
11. Wages	$ 243,140
12. Fuel	695,903
13. Water	66,652
14. Lubricants and waste	22,013
15. Miscellaneous supplies	29,962
Total Gross Expenses of Power Plant	$1,057,670
Credit from sale of electricity	281,880
Net Expense of Power Plant	$ 775,790
16. Provender and stable expense	387,235
Total Power Plant and Stable	$1,163,025
Operation of Cars:	
17. Superintendence of transp.	$ 169,379
18. Wages of conductors	1,673,426
19. Wages of motormen	1,854,895
20. Wages of miscel. car service men	243,214
21. Wages of car house men	306,867
22. Car service supplies	56,871
23. Miscel. car service expense	152,564
24. Hired equipment	1,785
25. Clearing and sanding track	130,057
26. Removal of snow and ice	76,194
Total Operation of Cars	$4,670,252
General Expenses:	
27. Salaries of general officers	$ 91,119
28. Salaries of clerks	115,199
29. Printing and stationery	26,253
30. Miscel. office expense	7,589
31. Stores expenses	74,952
32. Stable expenses	98,841
33. Advertising and attractions	3,213
34. Miscel. general expense	54,065
35. Damages	1,064,716
36. Legal expense incident to damages	314,633
37. Miscel. legal expense	122,874
38. Rent of land and buildings	119,787
39. Rent of track and terminals	52,842
40. Insurance	128,386
Total General Expense	$2,273,469
Grand total	$11,858,597
Taxes assessed	$ 1,207,237

Since there were 50,637,061 passenger car miles, the cost per car mile was as follows:

	Cents per car mile.
Maintenance of Way and Structures:	
1. Track and roadway	1.694
2. Electric line	0.526
3. Buildings and fixtures	0.316
Total Maintenance of Way	2.536
Maintenance of Equipment:	
4. Steam plant	0.181
5. Electric plant	0.108
6. Cars	1.876
7. Electric equip. of cars	2.095
8. Miscel. equipment	0.097
9. Shop expense	0.136
10. Renewal of horses, harness, etc.	0.380
Total Maintenance of Equip.	4.873
Operation of Power Plant:	
11. Wages	0.479
12. Fuel	1.372
13. Water	0.132
14. Lubricants	0.044
15. Miscellaneous supplies	0.059
Total	2.086
Credit from sale of electricity	0.554
Net expense of power plant	1.532
16. Provender and stable	0.764
Total Operation of Power Plant	2.296
Operation of Cars:	
17. Supt. of transportation	0.335
18. Wages of conductors	3.304
19. Wages of motormen	3.662
20. Wages of miscel. car service men	0.490
21. Wages of car house men	0.606
22. Car service supplies	0.113
23. Miscel. car service expense	0.301
24. Hired equipment	0.004
25. Cleaning and sanding track	0.257
26. Removal of snow and ice	0.150
Total Operation of Cars	9.222
General Expense:	
27. Salaries of general officers	0.179
28. Salaries of clerks	0.227
29. Printing and stationery	0.052
30. Miscel. office expense	0.015
31. Stores expense	0.148
32. Stable expense	0.195
33. Advertising and attractions	0.006
34. Miscel. general expense	0.107
35. Damages	2.102
36. Legal expense incident to damages	0.622
37. Miscel. legal expense	0.243
38. Rent of land and buildings	0.237
39. Rent of track and terminals	0.105
40. Insurance	0.254
Total General Expense	4.492
Grand total	23.419
Taxes assessed	2.384

We have already stated that the maintenance expenses were unusually high during 1908. A comparison with the fiscal year ending June 30, 1907, will give a better conception of the matter. A summary of the operating expenses per car mile, for the two years, is as follows:

Year.	1907.	1908.
Maintenance of way and structures.	1.700	2.536
Maintenance of equipment	2.920	4.873
Operation of power plant	1.962	2.296
Operation of cars	8.707	9.222
General expense	4.424	4.492
Total	19.713	23.419

The maintenance of way expenses were abnormal for the year 1907, as well as for the year 1908, although not in so great a degree.

The maintenance of track and roadway (Item 1) amounted to $3,940 per mile of trackway (218 miles) for the year 1908, and $2,560 per mile for 1907. The maintenance of electric line (Item 2) was $1,220 per mile of trackway for 1908, and $650 for 1907. All of these are excessively high unit costs.

The maintenance of cars (Items 6 and 7) amounted to $575 per passenger car for the year 1908, and $400 per car for 1907. About 20 per cent of the cars were open cars in 1908, but 29 per cent were open cars in 1907. While these car maintenance costs are high, we are of the opinion that the average of these two years is not far above normal for large street cars that have been in use a number of years. Unfortunately no data are available by which the average first cost of these cars can be determined. It is probable, however, that the first cost was about $4,000 per car.

The total rated capacity of the dynamos was 38,500 KW. The maintenance of the steam and electric plant (Items 4 and 5) was as follows for the year 1908:

	Per KW.
Steam plant	$2.40
Electric plant	1.42

It was slightly less for the year 1907.

The renewal of horses, harness, etc. (Item 10) is clearly out of the ordinary, being nearly $88 per horse. For the year 1907 the same item was $38 per horse.

Coming now to the operation of the power plant, we find it necessary to show the cost per KW. hr., for 28 per cent of the electricity produced was sold. Moreover, 10 per cent of the cars were not operated by electricity.

There were generated 169,604,248 KW. hrs., requiring 3.19 lbs. coal per KW. hr. The coal was 38 per cent anthracite and 62 per cent bituminous, and the average price was $3.00 per ton of 2,240 lbs. Of the electricity generated, 47,075,911 KW. hrs. (or 28¼ per cent) were sold at 0.6 ct. per KW. hr. There were left 122,528,337 KW. hrs. to operate the electric cars, etc. Of the 50,637,061 passenger car miles, we estimate that 11 per cent were horse car miles. There were nearly 1,100 teams of horses. Allowing 15 miles per team per day for 365 days, we have 5,922,500 horse car miles. We have already seen that about 11½ per cent of the conductors were horse car conductors. In round numbers, therefore, 45,000,000 car miles were electric passenger car miles, which required 122,528,337 KW. hrs., or about 2.72 KW. hrs. per car mile. We have seen that the cost of operating the power plant (Items 11 to 15) was $1,057,670. This is equivalent to 0.62 ct. per KW. hr. Since a 38,500 KW. plant produced nearly 170,000,000 KW. hrs., each KW. produced nearly 4,410 KW. hrs. There are 8,760 hrs. in a year, hence the load factor was $4,410 \div 8,760 = 50$ per cent.

The provender and stable expense (Item 16) amounted to $176 per horse, or practically 50 cts. per day. In addition there were general stable expenses (Item 32) amounting to $45 per horse, or 12 cts. per day. There was one stableman for every 7.3 horses. In 1907 the maintenance cost per horse per day was as follows:

	Per day
Wages of stablemen	$0.15
Provender	0.29
Stable equipment, coal, etc.	0.02
General stable expense	0.08
Horseshoeing	0.03
Total	$0.57

The provender and stable expense (Item 16) amounted to $387,235 for 1908, or about 7 cts. per horse car mile. Whereas the other items of power plant operation (Items 11 to 15), deducting electricity sold, amounted to $775,790, or 1.68 cts. per electric passenger car mile. It will be seen, therefore, that had all cars been operated by electricity the cost of power per car mile would have been exceedingly low.

When we come to consider the cost of operation of cars, we find that the wages of conductors and motormen (Items 18 and 19) amount to nearly 7 cts. per car mile. This is unusually high, yet the hourly rates of wages were moderate, conductors receiving 21½ cts. and motormen 22½ cts. per hr., during the first year, and an increase of 1 ct. per hr. for each of the succeeding two years, and another 1 ct. after the fifth year. About half the men were first year men. In striking contrast with this is the corresponding cost of wages of conductors and motormen on the New York Subway (see ENGINEERING-CONTRACTING, April 13, 1910), which was less than 1.8 cts. per car mile. This difference is due largely to the higher speed of the subway cars, and partly to the fact that one motorman operates several cars in a train.

The cost of damages due to accidents (Items 35 and 36) is worthy of particular note. For the year 1908, this sum was $1,379,349. For the year 1907 it was $1,590,577. We see that for 1908 the cost of accidents was more than 11 per cent of the total operating cost, and was equivalent to 2.72 cts. per car mile, being considerable more than the entire cost of power plant operating expenses! Indeed, if an additional employe had ridden on each car, the added wages would not have greatly exceeded the outlay due to damages. During 1908 the total number of accidents of all kinds was 14,551, which resulted in 151 deaths. Of the deaths only 20 were passengers and 15 were employes. There were 738 persons injured, making a total of 889 killed and injured.

In greater New York during the same year 398 were killed and 18,006 were injured on all the street car lines.

Dividing the $1,377,349 by the 218 miles of trackway operated by the New York City Ry. Co., we get nearly $6,800 per mile as the cost of accidents for the year 1908. Capitalizing this at 6 per cent we have $113,000 as the justifiable expenditure per mile of trackway to prevent the accidents.

The operating income for the year was:

Passengers	$15,569,429
Mail	1,465
Express	34,594
Advertising	224,249
Rent of tracks	14,899
Rent of equipment	16,134
Sale of power	12,429
Total	$15,873,130

Cost of Constructing, Equipping and Operating 36 Miles of Electric Suburban Railway—New York and Long Island Traction Co.

This company was incorporated in 1899. Its stock is controlled by the Interborough Rapid Transit Co. The following data are based upon a report for the fiscal year ending June 30, 1908.

The mileage owned was as follows:

	Miles of roadbed.
Mineola to Grant St., Brooklyn	24.85
Mineola to Jerico and Hempstead turnpike	5.86
Hempstead to Belmont Park	5.58
Total miles of first track (no second track)	36.29
Sidings, storage track, etc.	4.36
Total track owned	40.65

In addition, the company has trackage rights over 4.55 miles of double track line, or 9.10 miles of track, over which it operates its cars.

The cost of construction and equipment of the 36 miles owned is reported as follows:

1. Engineering and superintendence	$ 43,871
2. Right of way (7.32 miles owned)	70,771
3. Real estate used in operation of road	7,427
4. Track and roadway construction	593,298
5. Electric line construction	150,277
6. Buildings and fixtures used in operation	11,424
7. Power plant equipment	147,581
8. Shop tools and machinery	1,786
9. Cars	114,620
10. Electric equipment of cars	77,293
11. Miscellaneous equipment	19,539
12. Organization	81,377
13. Interest and discount	20,302
14. Miscellaneous	1,522
Total	$1,374,088
15. Road built and equipped by contract	944,468
Grand total	$2,318,556

Item 15 is the only one that is not very clear. When roads of this sort are "built and equipped by contract," the contractors are usually the promoters, and they frequently pay themselves very liberally in stock. In fact, items of this kind often represent nothing else than the promoters' profits.

Dividing each of the 15 items by 36.29, we get the following cost per mile of road:

	Per mile of Road.
1. Engineering and superintendence	$ 1,210
2. Right of way	1,951
3. Real estate	204
4. Track and roadway constr.	16,347
5. Electric line constr.	4,141
6. Buildings	1,141
7. Power plant equipment	4,067
8. Shop tools and machinery	50
9. Cars	3,158
10. Electric equip. of cars	2,130
11. Miscel. equipment	537
12. Organization	2,326
13. Interest and discount	560
14. Miscellaneous	41
Total	$37,867
15. Road built by contract	26,025
Grand total	$63,888

Since there are 1.12 miles of track per mile of road, each of the above items should be divided by 1.12 to get the cost per mile of track.

A study of these costs leads to the conclusion that Item 15 represents very little else than promoters' profits. Certainly Items 4 and 5, which aggregate $20,488, suffice to cover the ordinary cost of grading and track and electric line construction of a single track electric road.

The following are the physical characteristics of the line:

Rails weigh 65 to 107 lbs. per yd.; 26.2 miles being 7-in. girder, and 10.1 miles being 70 lbs. tee-rails. The average age of the rails was 4.2 yrs., of ties 3.5 yrs., as of June 30, 1908. There were 7 miles of cinder ballast; no other ballast reported. The electric line construction consists of 4.56 miles of overhead trolley, span wire, and 31.73 miles of side brackets. There are 52 poles per mile, 34.19 miles being wood poles and 2.10 miles iron or steel. There are 2,261 lin. ft. of steel bridges (trestles?); 638 lin. ft. of combination bridges; 2,241 lin. ft. of timber trestles; and one overhead railway crossing; 8 pipe culverts and 3 stone box culverts.

The power equipment was as follows:

	Total cap.
3 boilers (water tube)	900 HP.
2 steam engines	1,500 HP.
2 generators (direct A. C.)	1,000 KW.
3 station transformers	900 KW.
1 booster for outside feeder	350 KW
1 auxiliary generator	120 KW
2 rotaries	600 KW
2 exciters	100 KW.
2 rotary converters in sub-stations	400 KW.
3 transformers in sub-stations	600 KW.
275 storage battery cells in sub-stations	200 amp. hr.
1 motor-generator in sub-station	10 KW.

The rolling stock (all owned by the company) was as follows:

4 closed motor cars, 20 tons each, 42 ft. long.
25 semi-convertible motor cars, 18 tons, 40 ft. long.
1 combination passenger and express, 21 tons.

30 total revenue cars.
3 snow plows (motor), 10 tons.
2 sweepers (motor), cost $4,600 each.
3 service cars (1 motor car).

The average seating capacity of the cars was 44 passengers.

We have seen that these 30 passenger cars cost $114,620 (Item 9) for the bodies and trucks, and $77,293 (Item 10) for the electric equipment, making a total of nearly $6,400 per car having an average weight of a little more than 18 tons.

We have seen that the capacity of the power plant was 1,000 kw., and that the power plant equipment (Item 7) cost $147,581, or $148 per kw. Item 6 gives the cost of all buildings at $41,424. Presumably a large portion of this expense was for power station and sub-station buildings.

The power plant generated 4,491,600 kw. hrs., consuming 3.50 lbs. of anthracite per kw. hr., the cost of which was $3.40 per ton of 2,000 lbs. In addition to this, 333,319 kw. hrs. were purchased, at 2.5 cts. per kw. hr.

The employes' and operating expenses were as follows for the year ending June 30, 1908:

General Office Staff:
2 general officers.
3 other officers.
10 other employes.

15 total general office staff.....$8,029

Transportation:
2 inspectors.
2 train clerks and dispatchers.
1 superintendent.
42 conductors (20 cts. per hr.).
40 motormen (20 cts. per hr.).
2 switchmen, flagmen and yardmen
18 road and trackmen

107 total transportation $55,444

Power:
2 engineers.
1 oiler.
3 firemen.
3 coal passers.
2 dynamo and switchboard men
4 linemen.
3 other power plant employes.

18 total power $10,947

Car House and Shops:
3 car cleaners.
2 car oilers.
6 car house repairers.
1 other car house employe.
1 carpenter.
1 blacksmith.
1 machinist.
2 armature winders.
1 electrical helper.
4 other shop employes.

22 total car house and shops.....$13,922

163 total employes $83,342

The operating expenses were as follows:

	Maintenance of Way and Structures:	
1.	Track and roadway	$ 11,261
2.	Electric line	3,876
3	Buildings and fixtures	293
	Total maintenance of way	$ 15,430
	Maintenance and Equipment:	
4.	Steam plant	$ 1,299
5	Electric plant	246
6.	Cars	12,881
7.	Electric equip. of cars	17,276
8	Miscel. equip.	312
9	Shop expense	2,251
	Total maintenance of equipment	$ 34,215
	Operation of Power Plant:	
10	Wages	$ 8,047
11.	Fuel	26,779
12.	Lubricants and waste	727
13.	Miscel. supplies and expenses	229
14.	Hired power	8,333
	Total operation of power plant	$ 44,075
	Operation of Cars:	
15.	Superintendence of transportation	$ 900
16.	Wages of conductors	25,359
17.	Wages of motormen	20,499
18.	Wages of miscel. car service men	5,131
19.	Wages of car house and employes	28
20.	Car service supplies	1,860
21.	Miscel. car service expense	6,843
22.	Cleaning and sanding track	1,297
23.	Removal of snow and ice	844
	Total operation of cars	$ 57,802
	General Expenses:	
24	Salaries of general officers	$ 2,960
25.	Salaries of clerks	965
26.	Printing and stationery	770
27.	Miscel. office expense	94
28.	Stores expenses	372
29.	Stable expenses	245
30.	Miscel. general expenses	1,720
31.	Damages	21,201
32.	Legal expense incident to damages	3,220
33.	Miscel. legal expense	2,916
34.	Rent of land and buildings	640
35.	Rent of track and terminals	16,667
36.	Insurance	587
	Total general expense	$ 52,359
	Grand total	$203,882

The taxes assessed for the year were $22,474.

The traffic statistics were as follows:

Passenger car miles	1,184,581
Same per mile of all track	29,141
Same per passenger car in use	39,486
Same per passenger	0.217
Freight, mail and express car miles	None
Service car miles	No record
Passenger car hours	100,915
Passenger car miles per hr. (speed)	11.74
Car trips	42,801
Car miles per trip	27.68
Passengers at 5 cts.	5,416,662
Passengers at lower rates	39,303
Passengers in chartered cars	5,200
Passenger fares per car mile	4.61

The operating expenses per passenger car mile were as follows:

		Cents per Car Mile.
	Maintenance of Way and Structures:	
1.	Track and roadway	0.951
2.	Electric line	0.329
3.	Buildings	0.023
	Total maintenance of way	1.303
	Maintenance of Equipment:	
4.	Steam plant	0.110
5.	Electric plant	0.019
6.	Cars	1.082
7.	Electric equip. of cars	1.459
8.	Miscel. equip.	0.028
9.	Shop expenses	0.190
	Total maintenance of equipment	2.888
	Operation of Power Plant:	
10.	Wages	0.675
11.	Fuel	0.262
12.	Lubricants and waste	0.062
13.	Miscel. supplies and expenses	0.019
14.	Hired power	0.703
	Total operation of power plant	3.721
	Operation of Cars:	
15.	Superintendence of transp.	0.076
16.	Wages of conductors	1.722
17.	Wages of motormen	1.731
18.	Wages of miscel. car service men	0.432
19.	Wages of car house employes	0.003
20.	Car service supplies	0.157
21.	Miscel. car service expense	0.577
22	Cleaning and sanding track	0.110
23.	Removal of snow and ice	0.071
	Total operation of cars	4.879
	General Expenses:	
24.	Salaries of general officers	0.250
25.	Salaries of clerks	0.082
26.	Printing and stationary	0.065
27.	Miscel. office expense	0.007
28.	Stores expenses	0.031
29.	Stable expenses	0.020
30.	Miscel. general expenses	0.145
31.	Damages	1.789
32.	Legal expense incident to damages	0.272
33.	Miscel. legal expense	0.247
34.	Rent of land and buildings	0.054
35.	Rent of track and terminals	1.408
36.	Insurance	0.050
	Total general expense	4.420
	Grand total operating expenses	17.211
	Taxes	1.899

Maintenance of track and roadway (Item 1) cost $310 per mile of road (36.3 miles), as compared with $225 for the preceding year. Maintenance of electric line (Item 2) cost $107 per mile of road, as compared with $181 for the preceding year. Maintenance of power plant (Items 4 and 5) cost:

	Per KW.
Steam plant	$1.26
Electric plant	0.29
Total	$1.55

During the previous year these maintenance costs were:

	Per KW.
Steam plant	$2.38
Electric plant	1.09
Total	$3.47

The maintenance of cars and their equipment (Items 6 and 7) cost $1,000 per passenger car, which was practically the same the preceding year. Since the average cost of the cars was $6,400 each, the maintenance expenses exceeded 16 per cent, for it should be noted that Item 9, shop expenses, should be prorated among Items 4 to 8. All these cars were in service throughout the year, for none of them were open cars for summer use only.

The operation of the power plant (Items 10 to 13) cost $35,742 for the production of 4,491,600 KW. hrs., or nearly 0.8 ct. per KW. hr. The purchase of additional power at 2.5 cts. per KW. hr accounts largely for the high cost of power per car mile; but it should be noted that these large cars, running at comparatively high speed, consumed 4.07 KW. hrs. per car mile. On the other hand, the high speed reduced the cost of conductors' and motormen's wages per car mile.

This 1,000 k. w. plant produced 4,492 k. w. hrs. per k. w. of plant capacity. Since there are 8,760 hrs. in a year, the load factor was $4,492 \div 8,760 = 51.4$ per cent.

Damages (Items 31 and 32) were very high. Rent of track (Item 35) also ran up the car mile cost of general expenses.

The operating income was:

Passengers	$277,773
Chartered cars	923
Advertising	450
Rent of tracks	138
Rent of equipment	1,098
Miscellaneous	374
Total	$280,756

Some Notes on the Florida East Coast Railway Work.

In reply to a request for cost data on the construction of the Florida East Coast Ry. Extension to Key West, a member of the editorial staff, who was formerly connected with that work, has received the following letter:

Sirs: Regarding cost data, it will be impossible for me to give you any for the reason that I do not know much about the costs. The costs are not of much value for the reason that there will never be any work done in the world under the same conditions. Our situation is so different from any other work on earth that the costs would only be of value to satisfy curiosity. One can't keep men in an out of the way place like this without paying them and when bad weather comes, delays are experienced on account of being out of some kind of material and the expense goes on. For that reason it costs almost as many dollars to build two piers a week as to build eight piers a week. If things keep moving right along—each item of work in its proper sequence, it is easy to complete as high as eight or even ten piers a week. A little blow comes along and destroys three or four coffer dams. That ties up the lower shaft work of the pier while we build some more cofferdams and set, seal and wait four days to harden before pumping. In the meantime the upper shaft work catches up and everything is "two blocks." A schooner of sand or gravel sometimes is becalmed over among the Bahamas and doesn't get in sometimes for 30 or 40 days. These things cannot be helped, but all cost money. On the other hand, we might, and even do, sometimes have a couple of months of good weather and with plenty of material, and we build concrete cheaper than it was ever built in this country, price of material considered. Even that is not a fair estimate for cost for we might not be able

View Showing Construction of Piers for Florida East Coast Railway Viaducts.

to do it again in a year. I am writing you rather in full on this for the reason that it might furnish a good reason why no one has ever taken up that phase of the subject.

The method of construction is almost exactly the same as it was when you were here except in minor matters, which have reduced the number of men necessary to do the work, and the machines have also been reduced somewhat in number and cost of operation. The pile driver drives the 17 anchor piles inside, and the 12 anchors and fender piles around the outside of the place where the cofferdam will set. Then the "catamaran" sets the cofferdam and the pump barge cleans it out and places sand bags around it. Work Barge No. 5 places the concrete seal. After four days Derrick Barge No. 96 pumps out the cofferdam, cleans off the [illegible] sets the lower form. Work Barge No. 5 concretes the [illegible] placing the 34 reinforcement rods. Then Derrick Barge No. 3 sets the upper form and Work Barge No. 5 concretes it and the job is done. The "catamaran" pulls its own cofferdam and also at the same time pulls the lower shaft forms.

Derrick Barge No. 9 is fitted with a long boom and she sets the steel girders. The steel setting is a very small matter for this machine for the reason that she has set as high as eight 80 ft. spans in a day, and, with very favorable conditions, could possibly set as high as twelve spans. We use the derrick and crew for almost an endless variety of service besides keeping the steel set as fast as the concrete is completed.

The present design—piers and steel girders—calls for a continuous viaduct from Knights Key across Pigeon Key to Little Duck Key. This will be 6¾ miles long. The west 9,000 ft. approaching Little Duck Key, however, will in all probability be 25 ft. concrete arches.

C. S. COE,
Division Engineer.

Knights Key, Fla., April 24, 1910.

For the reader to understand more clearly the conditions and method used in construction a little explanation is necessary. As is pretty generally known, the railroad is built over salt water, connecting the chain of islands between the southern point of Florida and the island of Key West. The first 3 miles of bridge work was from Long Key, west, and was in the form of 50-ft. concrete arches. The work now going on is of piers and steel girders. The piers are 80 ft. on centers and the girders are 9 ft. in depth, the top of rail being about 30 ft. above the water. The water is, on an average, about 16 ft. deep, but in one or two places is as deep as 30 ft. The tide runs very swiftly and when three or four cofferdams are set in a row the velocity of the tide is increased to about 7 miles per hour. This causes no little difficulty in setting the cofferdams and holding them in place.

The bottom, or foundation for these piers, is coral rock and is generally pretty clean, but a dredge goes ahead of the work and cleans up any muck which may accumulate, or be in the way of the pile driver. The pile driver follows and drives 17 piles for the foundation anchor piles in each pier, and 12 piles to be used as anchor piles for the cofferdam. In driving these piles a 6-in. punch is first used and the piles are then placed and driven about 4 ft. into the coral rock. The hardness of the rock varies greatly. In some places 10 or 20 blows of an 800-lb. steam hammer will drive the punch 4 ft. into the rock, and then again another point 5 ft. away may require 600 or 800 blows to get the same penetration.

The cofferdam is built upon a scaffolding supported by the piling, and when already to be lowered and set in position it is handled by a derrick on the catamaran. It is built of 4x8-in. lumber and braced inside with 8x10-in. timbers. All joints are calked and closed with pitch and tar. After anchoring in position and pumping out the cofferdam a 4-ft. seal is placed. Four days are allowed for the seal to set and then the cofferdam is again pumped out and the carpenters build up the lower half of the pier form and place the 34-in. reinforcing rods. These rods are set 6 ins. from the face of the pier all around and in a vertical position or parallel to the batter of the pier.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Cost of Power for Various Industries Under Ordinary Conditions.*

Twenty-five years ago the expression "cost of power" was fairly well defined as meaning the yearly cost per indicated horsepower if produced by steam; or power on the wheel shaft if produced by water for 10 hours a day and about 308 days a year, or for 24 hours for the same number of days. This was fairly well understood by those who had to deal with these matters and who gave the matter any thought.

Since that time, when mechanical transmission of power by shafting, belting, ropes, etc., were about the only methods in use, there has been developed the electrical transmission of power now so commonly in use, with new units of power, as electrical horsepower and kilowatts.

Also there has now come into common use the steam turbine, for which there is no indicated horsepower, the measurements of power from which must be brake horsepower, electrical horsepower or kilowatts. There is the power produced by water wheels, which is gross horsepower, net horsepower at the wheel shaft and, when transformed into electric power, it is measured in electrical horsepower and kilowatts.

New industries like public lighting and street railway companies have also come into existence. In these plants, the cost of power is affected very greatly by factors which were unknown to the type of plant which was common to industrial concerns of the past.

So today the statement, "cost of power," unless clearly defined, may mean one of many things, and the men who are used to thinking in the units and figures common to the old type of plant are sometimes at a loss to know what is meant when the cost is stated in some of the newer ways, as, for instance, so much per kilowatt hour, delivered. These figures must be translated back into indicated horsepower or its equivalent before any definite impression is made on their minds. Even then they may be at a loss to understand why the costs are so different from the ones they have in mind as a basis of comparison. It is the object of this paper to explain briefly some of the reasons for the very great differences in the cost of power under various circumstances, hoping that these explanations may be of value to those who have to deal with these matters. It is our intention to treat the factors affecting the net costs to various industries of both steam and water power, and to give a few examples of these which have come up during the course of our own engineering practice.

The gas engine, while giving some very fine results in some industries like steel mills, where the waste gases from the furnaces are used in gas engines, will not be considered further in this paper, as it is not sufficiently in common use yet to be of especial interest to us in this section of the country.

Items in Cost of Power.—It may be said generally that the cost of producing power can be divided into two parts:

(1) *Independent charges,* or the part which is independent of the output, embracing fixed charges on the plant, as interest, depreciation, insurance and taxes, and, to a certain extent, repairs.

(2) *Proportional charges,* or the part which is proportional to the output, including such charges as coal, labor, supplies, etc.

Steam plants in general may be said to have low independent charges and high proportional or operating costs.

Water power plants are usually the reverse, with high fixed charge accounts and low operating costs.

Another item which should be mentioned as affecting the cost of power is what Dr. Steinmetz calls "reliability factor," which takes into consideration the spare machinery needed to insure continuous service. The charges on this spare equipment are apt to have quite a bearing on the cost of power in a central station supplying power for public uses, where reliability must be one of the chief considerations and more spare or duplicate plant is usually maintained than in a private plant. This same factor, too, may have quite an important bearing on the value of a water power privilege.

Factor Affecting the Cost of Power.—The chief conditions which affect the cost of steam power are as follows:

(1) Cost of fuel delivered to the furnaces.
(2) Amount of power produced.
(3) The load factor in its relation to fixed charges, whether the power is continuous and uniform, or intermittent and variable.
(4) The net cost of power is reduced considerably in some concerns where the waste heat of the power plant can be used in the manufacturing processes in the form of low pressure steam or warm water.

The chief conditions which affect the cost of water power are as follows:

(1) Fixed charges on the development.
(2) Amount of power produced in its relation to fixed charges.
(3) The load factor in its relation to efficiency of wheels, pondage and reservoir capacity.
(4) The cost of supplementary power necessary to make up for the fluctuations of the water power, if required.

Variation in Cost of Steam Power.—Steam power costs the most per unit of power when produced in small amounts, and the cost is increased for fluctuating loads and when used for purposes where the load factor is small. By "load factor" we mean, in this particular instance at least, the average output in per cent of the full capacity of the plant. The cost of power in very small amounts has been eliminated from this paper, and it has been assumed that the plants discussed for different uses are fairly large and of about the same capacity.

Steam power costs the least per unit of power for comparatively steady continuous loads, as for paper mills and other similar industries, and the cost may be still further reduced where there is use for exhaust steam or other by-products from the plant. Such conditions as the last are found in colored textile mills. Power costs the most in plants having a low load factor with a variable load and where there is no use for the by-products of the plant, as in a lighting or street railway plant. Between these extremes are various industries for which the cost of power will vary greatly.

Industries running ten hours a day have a low load factor comparatively, but the load while on is often fairly steady, particularly in textile mills. Public service plants usually have a load factor somewhat lower than textile mills, but the load is extremely variable, which is not nearly so favorable to economical operation as the textile load would be.

An example of the reverse of the procedure in a colored textile mill might be cited in the case of a steel mill, where the waste gases from the furnaces might be used in a steam or gas engine plant, thus making the net cost of power very low.

Power for Various Industries.—So far as we know, the net cost of steam power is the least and the net value of water power (but not of water) also the least for colored textile mills of any of the important industries. This is

*A paper by Charles T. Main and F. M. Gunby, read before the Boston Society of Civil Engineers and published in the Journal of the Association of Engineering Societies for March, 1910.

due to the usually steady load and to the fact that the waste products from the steam plant are most valuable for manufacturing purposes to those industries. If the heat required is not obtained from the waste products, it must be obtained direct from a separate boiler plant.

The net cost of steam power for textile mills gradually increases from the cost to the mill which can use all of the waste products, which will have the lowest cost, to the case of mill making white goods, where only exhaust steam for warming the buildings and drying the yarn on the slashers can be used. Next to this latter case in favor of net low cost are the industries of any nature where exhaust steam can be used only for heating. In order to give a general idea of the usual costs of power under ordinary conditions in this section of the country, an analysis of the cost of power for a station of 2,000 k. w. capacity is given below. This station is similar to some which have been constructed within the last few years. Later on will be given some of the effects of by-products from the plant for manufacturing purposes.

Cost of Power for Textile and Similar Industries.—Let us first consider the cost of power under the various conditions for textile mills, and from these cases an idea of the cost to various other industries can be derived.

As electric driving is becoming so common in textile mills, we will assume for the basis of these costs that the stations considered below will be electric and of 2,000 k. w. capacity, composed of two 1,000 k. w. units. The costs of power from this station will usually be given as so much per kilowatt. In case it is desired to reduce this cost per e. h. p., divide by 1.34. To get it to cost per indicated horse power, multiply the cost per electrical horse power by about 87 per cent, or the cost per kilowatt by about 65 per cent. It must be remembered also that there is no spare apparatus in these plants. This may be considered as fair average practice at present for manufacturing plants, but of course would not be tolerated for public service plants where reliability is so necessary.

In making up the cost of power here, all charges have been considered except the interest charges on the cost of land. These charges would be very variable, depending on the location of the plant. The cost of land for the station has also been omitted from the cost per kilowatt of the station. There are many opinions as to the proper percentage to charge to depreciation, interest, etc. In making up these costs, interest has been taken at 5 per cent; depreciation, repairs on the apparatus, at 5 per cent, and on the building at 2½ per cent; insurance and taxes at 1 per cent, making a total of 11 per cent on the apparatus and 8½ per cent on the buildings. This was for 10-hour power. For 24-hour power the depreciation and repairs on apparatus were taken at 13 per cent instead of 11 per cent. A small amount is added in both cases for incidentals.

These figures, of course, would not do for a station where the manufacture of current was the main product, as for a public service plant, because here, during a period covered by 4 per cent depreciation newer and more efficient types of apparatus might make it necessary to discard apparatus which was mechanically good. This course would not be so necessary in a manufacturing plant, where the saving of a small percentage of the cost of power is not of such vital importance as are some other considerations.

You will note that we say "cost of power as a straight power proposition." The reason for this is that the net cost of this power can be materially reduced by using the by-products from the plant for manufacturing purposes, as will be explained later.

Ten-Hour Power.—With a steam engine plant with direct connected generators the cost of the plant per kilowatt of capacity is about $125. The cost of power from this station, with coal at about $4.25 a long ton in the pocket or $4.75 on the grates, would be about $33 per kilowatt per year of 3,000 hours, as for a textile mill, as a straight power proposition. This is equivalent to about $24.60 per electrical horse power per year and about $21.50 per indicated horse power per year. This is equivalent to a cost of 1.10 cents per kilowatt hour.

If steam turbines are used instead of steam engines, the cost of the station will be reduced to about $105 per kilowatt capacity. The cost of power produced on steam turbines would also be reduced to about $29.50 per kilowatt year, against $33 for the engine plant. A part of this difference is made up from the reduced cost of the station and apparatus and a part from the better economy of the turbines, which we have assumed are using superheated steam and high vacuum, which is common practice. The use of superheated steam is not common practice in engine plants, and the engine plant considered was assumed as not equipped with superheaters.

Twenty-four Hour Power.—If steam power were to be generated for 24 hours a day for 6 days in a week or say 300 days a year, as for a paper mill or other similar industries, the cost of power would be about $57.50 per kw. per year for the engine plant and about $53 per kw. per year for the turbine plant. These costs reduce to 80 cts. per kw. hour and 73½ cts. per kw. hour, respectively.

These figures should be compared with 1.10 cts. per kw. hour for the engine plant and 0.983 cts. for the turbine plant when producing 10 hour a day power. The difference in the cost for the two kinds of power is due to the fact that practically the same amount of fixed charges is spread over a much greater number of kilowatt hours. There is also some saving in coal per kw. hour due to the elimination of banking of fires for a large portion of the time.

Load Factors.—The power plant for the textile mill operating 10 hours a day, 300 days a year, would have a load factor of about 40 per cent, while the plant operating 24 hours a day for 300 days would have a load factor of about 93 per cent. These figures of course assume that the plants are just large enough to drive their loads. This assumption is hardly true, especially at present, when the use of electric transmission makes it easy to provide spare units. The term "load factor" as used here means the ratio of the actual kilowatt hours generated in a year to the number which would have been generated had the plant run at full load every hour in the year. It must be remembered also that for the industrial plants under consideration the load is nearly constant throughout the operating time, which means good operating conditions.

Public Service Plants.—In a lighting plant for a city, even with the same load factor as for the 10-hour textile mill, which would be high for most of these plants, the operating conditions would not be nearly so favorable as in a textile mill, as about the same amount of banking would have to be done, and the prime movers would have to operate at variable loads. This latter undesirable feature would not be so serious in a large station as in a smaller one, so far as the efficiency is concerned, as the variation could be more nearly cared for by varying the number of units and thus operating all of them at advantageous points.

The cost of power for this type of plant is more, other things being equal, than for a plant of the same size for a textile mill having the same load factor. This is due to the effect of variable load towards a reduction in efficiency, and because of the greater cost of plant and consequently greater fixed charges per unit of output. It should be borne in mind, however, that these public service plants are usually of very large size and that their output delivered has to compete in price with the cost of power from very small stations. This would give the advantage all to the central station as far as the actual cost of making power is concerned. To the cost of making the power, the central station must add the cost of transmitting, distributing and selling it.

Effect of Use of Waste Products from Power Plant for Manufacturing Purposes.—For many years it has been common practice to use the by-products, such as exhaust steam and warm water from the steam plant, for manufacturing purposes and for heating buildings, etc. It has been also common practice to take steam out of the receiver between the cylinders of a compound engine for these purposes. The saving from using the exhaust of a noncondensing engine, which would otherwise go to waste, is large, because there is no additional steam required for the engine unless the back pressure is increased. Any use of the steam is nearly all clear profit, and if all of it is used, the only part left to charge to power is the difference in B. t. u. due to the difference in pressure and the condensation in the engine cylinder, jackets, etc. The use of large noncondensing engines for producing power, except in special cases, is becoming comparatively rare, but the use of steam from the receiver of a cross-compound condensing engine for manufacturing purposes and for heating, etc., is a common practice.

It should be remarked in passing that the steam turbine at present does not lend itself to the uses of obtaining manufacturing steam under such widely varying conditions as does the steam engine. There are, as far as we know, no reliable data taken from actual operation or tests on this subject, but from some figures which have recently been made by one of the large companies, we should think that it is a subject well worth thorough investigation. There seems to be no good reason why in time the practice of bleeding turbines should not be common.

Receiver Steam.—The table given below shows the amount of coal chargeable to power when certain percentages of the steam entering the high pressure cylinder are taken out of the receiver. This table takes into consideration the effects on the economy of the engine of not passing all of the steam into the low pressure cylinder, cylinder condensation, etc. The percentages in the first column are the percentages of the steam passing the high pressure cylinder which is taken out of the receiver for manufacturing purposes. The second column is the total coal burned, and the third is the coal chargeable to power after deducting the coal chargeable to manufacturing:

Per cent of exhaust steam used for heating purposes.	Lbs. of coal per i.h.p. per hour, all coal charged to power.	Net lbs. of coal per i.h.p., per hour after deducting for exhaust steam used.
0	1.75	1.75
25	2.06	1.50
50	2.38	1.25
75	2.69	1.00
100	3.00	0.75

If the mill did not obtain its power from steam, so that it could use the low pressure steam of the plant for manufacturing, it would have to maintain a boiler plant of sufficient size to produce an amount of steam equivalent to that bled out of the receiver. The amount of B. t. u. or its equivalent in coal chargeable to power is represented by the amount of work done by the engine, and the losses due to the presence of the engine. The cost of generating the rest of the steam is chargeable to the manufacturing processes. By cost of generating steam is meant the total cost, including coal, labor, fixed charges and supplies of all kinds for the boiler plant. The cost in the engine room does not vary with the bleeding of steam, except possibly in some very unusual cases.

Examples of Manufacturing Plants.—A few examples of the reduction in cost of power due to the uses of the by-products from a steam engine plant and the bleeding of steam from the receiver may be of interest. These are all given for textile mills as a basis. The corresponding costs for other industries can be calculated from the table and curves when the amount of steam required is known.

In one colored cotton and silk mill the power to run the mill was about 1,800 i. h. p. and for manufacturing purposes about 25 per cent of the steam for this was required in the form of steam from the receiver. This did not include the steam for heating the building, but the cylinder ratio was such that it was deemed unwise to bleed a greater amount of steam from the receiver. Assuming the cost

of power $33 per kw. with no bleeding, we get cost chargeable to power with 25 per cent bled continuously $12.75+$17=$29.75. The saving then would be $33—$29.75=$3.25 per kw. year; $12.75 is the engine room charge. This was for the use of low pressure steam alone. Probably another material saving could be made by using the overflow from the condenser for water for dyeing purposes, etc.

In another mill where much more dyeing was done, requiring a large quantity of hot water, also a large amount of exhaust steam for manufacturing and heating, the cost of power, if no steam and waste products had been used, would have been about $34 per kw. year; but when the proper credits had been allowed for items chargeable to manufacturing purposes, the cost was reduced to about $26 per kw. year, or a reduction of about $8 per kw. year.

In a plain or white goods mill where no steam would be required for manufacturing other than warming the building and slashing, the saving to be effected by using receiver steam for these purposes would be about $2 per kw. About three-fifths of this, or $1.20, is for heating and the rest for slashing, so about $1.20 per kw. is the amount of the reduction which could be made in heating the buildings of an industry similar to a textile mill. The above examples represent fairly average conditions.

Several years ago in one mill there was an 800 h. p. simple, noncondensing engine exhausting into the dyehouse. If the dyehouse was running full, the firemen in the boiler room could not tell whether this engine was running or not.

In paper mills the usual custom is to drive the paper machines with simple, noncondensing engines, the exhaust from which is used in the drying cans. The net cost of this power for coal is very small. In some mills some steam is also taken from the receiver of compound engines for other low pressure work.

The Cost of Water Power. The cost of water power depends upon a great variety of factors, but the essential feature is usually the fact as to whether the combined result of all these factors is such as to make the cost of the development per horse power delivered a reasonably small amount so that the fixed charges shall not be excessive. In other words, the allowable cost of water power cannot be materially more than the net cost of producing the same amount of power for the same purpose in some other satisfactory manner, usually by steam.

There is an idea fairly common among laymen that water power is free or at least that after the development has been completed the cost of operation is practically nothing. This is not true because the fixed charges go on whether power is generated and sold or not. The largest item in the cost of water power is usually fixed charges. For instance, if a development should cost $125 per kw., the fixed charges alone would amount to about $12.50 per kw. per year whether the plant was operated or not.

Another idea is that if a development which is to produce 10-hour power costs about $100 per h. p. if carried to its most economical point, it will be a safe investment, but that if the cost reaches $200 per h. p. it will be well to proceed cautiously before investing in it. In general this idea is well grounded, but it should not be applied to all cases, as there are many factors affecting the cost of power and such great differences in the market that each case requires very careful study and general rules are not to be relied upon.

The cost of maintaining and operating a supplementary steam plant to make up for the shortage of power during low water and floods, the effects of droughts, transmission problems in the case of electric plants, etc., must all be carefully considered as factors properly affecting the actual cost of power delivered from the hydraulic plant.

For the reason that water powers usually have high independent charges they are more valuable for use on loads with high load factors than with low load factors and are hence more valuable for 24-hour power than for 10-hour power. Their value increases as the price of coal rises.

Many of the modern developments are of very large size and the cost per horse power of the plant is in some cases small. In the determination of the cost of power, the cost per horse power of development should not be allowed to confuse or cause misrepresentation of the actual cost of power delivered. Usually the larger the development installed, the smaller is the cost per horse power of development, but it does not follow in all cases that the cost of delivered power will be smaller per horse power. After the engineers have made their estimates of the cost of physical structures for these developments, there must usually be added generous items for interest during construction, interest on cost before there is any return, rights of way, incidentals, promoting, etc. The neglect of considering items like these has caused several of the recent developments to get into disrepute.

There are usually more elements of chance and more unknown factors in a hydraulic development than in a steam plant, and these facts should be taken into consideration and properly cared for.

On the other hand, a development properly made and at a reasonable cost is a valuable asset and one which bids fair to increase in value if the price of coal increases in the future as in the past.

The prices of power where the development cost $100 and $200 per horse power mentioned above do very well for the ordinary case in the eastern states. There are, however, some particular uses, like mining, for instance, where there is no supply of wood, and coal is expensive, where a high cost of development is warranted and a high price can be obtained for the power. For example, there is one development where the cost of power at some mines was from $150 to $200 a year. A hydro-electric development was made and power delivered at about $100 a horse power, thus making a great reduction in cost to the mine owners and yielding a substantial profit to the electric company.

There is a development which cost about $400 a horse power to develop. A small portion of this power could be disposed of at the mines for $75 a horse power with comparatively short transmission lines, but the remainder had to be carried a long distance and sold in competition with other power. The fixed charges alone on this development were about $30 to $35 a year a horse power, and the running expenses were also high. It was impossible to produce power cheaply enough in this case to compete with other sources of powers and pay the fixed charges on the investment.

The following example is typical of many developments in New England streams with mechanical transmission of power. Compare the cost of producing 1,000 h. p. by steam and water power on an average stream at a fixed locality, where coal is $4.50 a ton delivered to boiler house, and the production of 1,000 h. p. by steam power alone at a chosen locality, where coal is $4 and $3.50 per ton delivered to boiler house.

The assumed power of the river varies in an average year so that for the driest month 490 h. p. will be produced by water, leaving 510 h. p. to be produced by steam; and for the other months in the year the water power varies so that for four months in an average year no steam power will be required at all. The average of this steam power will be about 238 h. p. for eight months per year.

In a dry year the minimum water power will be 250 h. p. It will be necessary to run the supplementary plant for about eight months, supplying in an average year from nothing to 510 h. p. and in a dry year up to 750 h. p. In order to have such a plant run anywhere near efficiently and cost a reasonable sum, it should be of such a size as to be overloaded for a portion of the time and underloaded for the rest of the time. In this case a plant rated at 500 h. p. capable of 50 per cent overloading would answer.

The water power plant will cost about $75 per h. p. of development, or $75,000.

The cost of the water power will be as follows:

Fixed charges on cost of plant, interest, depreciation, insurance, taxes and repairs, say 9 per cent, $75,000 by 0.09	$6,750
Attendance and supplies	500
Cost of water power if no charge is made for water	$7,250

The cost of supplementary power is as follows:

Estimated cost of plant, 500 h.p. at $60	$30,000
Fixed charges at 11 per cent	3,300
Average deficiency of water power, 338 h. p. for eight months.	
Coal 338 h.p. by 2.10 lb. by 205 days by 10 hr. = 650 tons at $4.50	2,925
Attendance	1,700
Oil, waste and supplies	200
Cost of supplementary steam power	$ 8,125

$7,250 + $8,125 = $15,375, total yearly cost of water power and supplementary steam power.
$15,375 ÷ 1,000 = $15.38 per h.p.

Compare this with the cost of 1,000 h. p. produced by steam alone where coal is $4 per ton. This power should easily be made for $20 a year a horse power, thus leaving a margin in favor of water power of $20—$15.38=$4.62 a horse power. With coal at $3.50 a ton, the cost of steam power alone should be not over $18.50, with a margin in favor of water power of about $3 a horse power.

Variation in Value of Water Power.—The value of a hydro-electric power to various industries will vary in approximately the same ratio as the cost of producing power in some other way, if considered as power pure and simple, without taking into consideration other important items affecting the business, which are sometimes more vital than the cost of power itself.

To illustrate the value and cost of power under different conditions it may be well to mention the two following cases:

A price for hydro-electric power was submitted to a colored textile mill, of 1.2 cts. per kilowatt hour. After due consideration, it was decided that the mill could not afford to accept the offer, the principal reasons being:

(1) On account of the use of steam for manufacturing purposes and of the water of condensation for dyeing, the net cost of steam power would be less than the price of hydro-electric power.

(2) It was better for the textile company to own and control its own plant, if it had the capital to build it, which it had, than to purchase current brought over many miles of pole line, and be tied up to some foreign company.

The cost of power per kilowatt at the switchboard from the hydro-electric company for the operating time of the mill was about $36 per kilowatt per year, and for the steam plant which the mill was proposing to install this cost was estimated at about $34 per kilowatt year; but if the power had been bought from the hydro-electric company, the mill would have had to install and operate a boiler plant nearly as large as the one required for both power and manufacturing steam. It was estimated that the use of the waste products from the steam plant would reduce the net cost of the power at least $8 per kilowatt.

In another case offers from two hydro-electric companies were made to furnish power. One offer was promptly turned down as being too high a charge. A second offer was to furnish current at 1.2 cts. per kilowatt hour, which is the same price which was refused for the colored mill. For a plain cotton mill, however, it was decided to be proper to accept the offer of 1.2 cts. per kilowatt hour.

The principal reasons for accepting this offer were:

(1) 1.2 cts. per kilowatt hour equals about $36 a kilowatt per year, or $27 an electric horse power delivered. This reduced back to indicated horse power equals about $23.50 per year, which was very near the estimated cost of steam power for the quantity required and at the price of coal for this particular industry.

(2) The mill desired to postpone the expenditure necessary for a steam plant if it could be done without serious loss.

Relative Importance of Cheap Power.—It is evident that where power is the chief product

of a plant, and is sold as energy in the form of electric lighting or electric power, it is important to produce the output at the minimum price.

In most industrial plants power is a means used to produce other product, which is sold, and it is apparent that, other things being equal, the necessity for cheap power is more important where the cost of power is a large proportion of the cost of the product, as in electro-chemical works, and the least important where the cost of power is a small per cent of the total value of the product.

Textile mills require considerable power to run them, and the method and cost of production of this power must be kept in mind in selecting a location for a new mill and in estimating the value of an old mill already located, but it should not be allowed to play too important a part in the decision.

The chief items of cost entering into the product of a mill are materials and labor. The cost of power in a fair sized mill should not be over 5 to 6 per cent of the total value of the product. It is, therefore, far more important to locate in some place where operatives skilled in the particular kind of business to be carried on or who can be trained to this work can be obtained at reasonable wages, and where the cost of transportation of raw material and finished product is a relatively small amount, than it is to seek a location where cheap power can be obtained, but where the other items are lacking. A saving of 10 per cent in cost of power would represent a saving of about one-half of 1 per cent of the value of the product.

The relative importance of locating a plant with reference to cheap power increases as the ratio of the cost of power to the value of the product increases. The relative importance of locating a plant with reference to the supply of help decreases as the amount of help required decreases. These factors tend to make textile mills locate with reference to good help and the paper mills with reference to cheap power. The latter use less help per horse power than the former, and usually use the power for 24 hours per day. This causes water power to be more valuable to paper mills than to textile mills.

Standard Prices for Hydro-Electric Power.—Sometimes this question is asked, "Is there any standard price for electric power delivered?" There does not appear to be any standard, the prices varying largely according to the amount taken. For small amounts large prices can be obtained. The price, of course, must have a close relation to that at which power from a steam station would be sold. The prices for power in large amounts, as for textile mills for permanent power, seem to vary between $20 and $25 per horse power delivered for 10-hour power, and for 24-hour power $30 to $40 per horse power.

For surplus or secondary power which can be furnished for more than six months but less than twelve months a year, the charges cannot usually be more than at a rate of $10 to $15 a year a horse power in large amounts for 10-hour power, or say about $1 a month a horse power for such time as it is furnished, for about all that is usually saved is coal, as the fixed charges are going on all the time in the steam plant, and often a portion of the steam plant is run all the time. In a recent case it was estimated that some colored mills could afford to pay at the rate of about $15 per year for secondary power, where the power could be obtained about ten months a year. This case represents fairly average conditions, where coal costs about $4 per ton and where the power is fairly steady from day to day, so that it is not necessary to keep a full force of steam plant help.

Conclusions.—A table of the average results of the costs of power in the vicinity as outlined in this paper would be about as follows:

Under the last column heading are given the possible reductions which may be made in the net cost of power by the use of by-products from the plant for manufacturing purposes. The extreme high saving from the engines would occur only when the engine was running noncondensing, which would be an extreme case.

The saving from the use of by-products from the turbine plants has not yet been determined. The condenser water can certainly be used, and probably quite a saving can also be made from bleeding low pressure steam.

Typical use of plants.	Type of prime mover.	Hours per year.	Cost per Year. — Kw.	E.H.P.	I.H.P.	Cost per kw. hr. cts.	Possible reduction from use of by-products for manufacturing.
Textile Mill	Steam engine	3,000	$33.00	$24.60	$21.50	1.10	$1.20 to $12.00
Textile Mill	Steam turbine	3,000	29.50			.983	
Paper Mill	Steam engine	7,200	57.50	42.90	37.40	.798	1.00 to 18.00
	Steam turbine	7,200	53.00			.736	
Textile Mill	Water power	7,200	26.70 to 33.50	20.00 to 25.00		.89 to 1.12	None
Paper Mill	Water power	7,200	40.00 to 53.50	30.00 to 40.00		.55 to .75	None

Some Costs of Stadia Surveys for the New York State Water Supply Commission.*

Genesee River Surveys.—At the beginning of the year work was in progress on a topographical survey of the Genesee Valley, undertaken in order to determine just what land subject to flood and what work in the way of channel-straightening would be required to improve the present conditions. This survey was made by stadia methods, and as the configuration of the ground was not favorable for triangulation, a system of primary stadia traverses was used for control with very satisfactory results. Over 60 miles of bench levels were run, based upon several convenient bench marks of the U. S. Geological Survey, and about 100 additional bench marks established, to which the stadia surveys were connected. An area of about 56 square miles was survey, and detailed topography taken, showing the contour of the ground, its subdivision and ownership, character of culture, and the location of all railroads, highways, buildings, fences, etc. A field force of twelve men was employed from the beginning of the year until the end of July.

Division headquarters were maintained first at Mount Morris and later at Rochester, with a computing and drafting force of two to four men. Here the field notes were reduced and the results mapped upon a scale of 100 ft. per in., these maps being later reduced to smaller scale and combined into final form at the Albany office.

Canaseraga Creek Surveys.—Upon the completion of the Genesee River surveys described above, late in July, 1909, the entire force was transferred to the Canaseraga Valley, and division headquarters re-established at Mount Morris. This project had already been investigated, and the work to be done determined, but under a recent change in the law it was required to define the extent and ascertain the ownership of the land which would be benefited by, and should bear the cost of, the projected work.

After a preliminary examination of the territory involved, it was decided that instead of making separate surveys of the outlines of the flooded area and the property lines within that area, it would be both quicker and cheaper to make a single stadia survey of the entire valley, from which all this information could then be obtained. A primary traverse and system of bench levels was therefore run, and stadia topography taken, exactly as already described in the case of the Genesee River surveys. The force employed was ten men in the field and two in the office, and the work, including computing and mapping on the scale of 100 ft. per inch, occupied the months of August, September and October.

Much time and pains were spent in obtaining accurate knowledge of the extent of land which is subject to damage by flood. After the completion of this field work and large scale mapping, the maps so plotted were reduced to a scale of 400 ft. per inch, and embodied in a single sheet, on which was plotted also the outline of maximum flood, as determined from the various data enumerated above. This line constitutes the boundary of the improvement district, and a written description of it, by courses and distances, was prepared.

	Portage Reservoir, June-Nov., 1908, 18.2 sq. miles.		Genesee River Improvement, Nov. '08, July, 1909, 56.1 sq. mi.		Canaseraga Creek Improvement, Aug.-Oct., 1909, 21.8 sq. mi.	
	Total.	Per sq. mile.	Total.	Per sq. mile.	Total	Per sq. mile
Field salaries	$8,847	$376.40	$8,681	$154.70	$2,925	$134.40
Field expenses and supplies	1,188	65.30	1,284	22.90	485	22.20
Total field work	8,033	441.40	9,965	177.60	3,412	156.60
Office salaries	2,320	127.40	2,901	51.70	1,175	53.90
Office expenses and supplies	159	8.80	342	6.10	105	4.80
Total computing and mapping	2,479	136.20	3,243	57.80	1,280	58.70
Total cost	$10,512	$577.60	$13,208	$235.40	$4,693	$215.30

Cost of Stadia Surveys.—The appended table shows unit costs of the topographical surveys made in 1908 for the Portage reservoir project, and in 1909 for the projects described above. For comparison with other figures of the same nature, it may be stated that these costs include all expense of every nature, such as rent, light and heat of field offices, livery, traveling expenses, stakes and office supplies, which was incidental to the field work, and to the reduction of the notes, plotting them to a large scale on detail paper, and inking the resulting maps.

The reduction of these original maps to smaller scales and their preparation in final form for filing or publication was not done by the division force, but at the Albany office, and the cost of this work is not included here.

The large reduction in cost between the Portage and Genesee surveys is due to the more favorable ground encountered, to the greater proficiency of the men employed, most of whom were at first entirely unfamiliar with stadia surveys, and to the interest taken by them in the work, and the resulting improvements in methods which were brought into use from time to time. The Canaseraga costs are somewhat lower than those of the Genesee, mainly because of the more favorable season at which the work was done.

*Extracts from the Fifth Annual Report of the Commission for the year ending Feb. 1, 1910.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Electrochemical Society.—May 5-7. Annual meeting at Pittsburg, Pa. Secy., Jos. W. Richards, South Bethlehem, Pa.

Appalachian Engineering Association.—May 6-7. Annual meeting at Winston-Salem, N. C. Secy., Henry M. Payne, Morgantown, W. Va.

National Fire Protection Association.—May 17-19. Annual meeting at Chicago, Ill. Secy., Franklin H. Wentworth, 87 Milk St., Boston, Mass.

American Railway Association.—May 18. Annual meeting at New York City. Secy., W. F. Allen, 24 Park Pl., New York City.

International Railway Fuel Association.—May 23-26. Annual meeting at Chicago, Ill. Secy., D. B. Sebastian, 327 La Salle Station, Chicago, Ill.

National Electric Light Association.—May 23-28. Annual meeting at St. Louis, Mo. Secy., T. C. Martin, 29 West 39th St., New York City.

American Society of Mechanical Engineers.—May 31-June 3. Spring meeting at Atlantic City, N. J. Secy., Calvin W. Rice, 29 West 39th St., New York City.

Engineers' Society of Pennsylvania.—June 1-3. Annual convention at Harrisburg, Pa. Secy., E. R. Dasher, Gilbert Bldg., Harrisburg, Pa.

Personals.

Charles Lyon McIntosh, Treasurer of the J. I. Case Threshing Machine Co., of Racine, Wis., died April 19 at Naples, Italy.

Mr. Ernest Clapp, a civil engineer of Hanna, Wyo., and Miss Ida Willis of Burlington, Vt., were married April 23, in the latter city.

Mr. Robert W. Boyd, Consulting Engineer, successor to Mr. Rudolph P. Miller, has removed his offices to the Tilden Bldg., 105 W. 40th St., New York City.

Mr. Edward Wegmann, Consulting Engineer for the old Aqueduct Commission of New York City, has been appointed Chief Engineer of the New Aqueduct Commission.

Nathan S. Teeple, formerly Superintendent of Construction for the Merritt & Chapman Derrick & Wrecking Co., died April 21 at his home in Brooklyn, N. Y., aged 76 years.

Mr. Will J. Sands, for the past six years Manager of the pumping engine and hydraulic turbine department of Allis-Chalmers Co., has resigned that position and will open an office in Boston, Mass., as a consulting engineer.

Mr. R. D. Stewart has been appointed Chief Engineer and General Superintendent of the Laramie, Hahns Peak & Pacific Ry., with headquarters at Laramie, Wyo., succeeding Mr. J. J. Argo, who has been appointed Locating Engineer.

Mr. Morris K. Trumbull, heretofore Engineer of Track Elevation for the City of Chicago, has been appointed Principal Assistant Engineer of the Chicago & Western Indiana R. R. and the Belt Ry. Co., of Chicago, with headquarters at Chicago.

John Henry Miller, capitalist, who conceived the plan and constructed the Belt Line tunnel of the Baltimore & Ohio R. R., at Baltimore, Md., said to be the first electric railroad tunnel in the country, died April 24 at Baltimore of angina pectoris.

Mr. L. G. Curtis heretofore Division Engineer Maintenance of Way of the Chicago division of the Baltimore & Ohio Ry., at Chicago, has been appointed Engineer Maintenance of Way of the recently organized Northwest system. Mr. E. D. Jackson, Assistant Engineer at Baltimore, Md., succeeds Mr. Curtis.

Mr. Charles A. Sussdorf has been appointed Assistant Deputy State Architect of New York. He will have charge of work under construction at the various state institutions. Mr. Sussdorf was born in Brooklyn and entered the employ of the state in 1895 under the late Isaac G. Perry, capitol commissioner, and has served almost continuously since that time.

Mr. Louis K. Rourk, Assistant Division Engineer of the Central Division of the Isthmian Canal, has been appointed Superintendent of Streets of Boston, Mass., succeeding Mr. Guy C. Emerson. Mr. Rourke was graduated from the Massachusetts Institute of Technology in 1895 and has been in the employ of the Ithmian Canal Commission since November, 1905.

W. Bledyn Powell, City Architect of Philadelphia, Pa., died April 26, at his home in that city after a long illness from cancer. He became architect for the city of Philadelphia 20 years ago and finished the construction of the City Hall. He also was connected with the construction of the Broad Street station of the Pennsylvania R. R., at Philadelphia. He was

The following changes in the Engineering Department of the Illinois Central R. R. have been announced: Mr. Harry R. Safford, resigned as Chief Engineer of Maintenance of Way to accept the position of vice president of Edgar A. Allen & Co. of Sheffield, England. The position of chief engineer of maintenance of ways is abolished and Mr. Lewis W. Baldwin has been appointed Engineer of Maintenance of Way and Lawrence A. Downs, formerly Assistant to the Chief Engineer of Maintenance of Way, is made Assistant Engineer of Maintenance of Way. Daniel J. Brumley, formerly Engineer of Construction, has been appointed Engineer of Construction, and the engineering departments of maintenance of way and of construction have been combined under Chief Engineer A. S. Baldwin.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Waterproofing.—Paper, 6x9 ins., 20 pp. Hydrex Felt & Engineering Co., New York.

This is a reprint of a paper read before the Western Society of Engineers, by Edward W. DeKnight, manager of the company.

Concrete Mixing Plants.—Paper, 10x6¾ ins., 24 pp. J. L. Smith Co., Old Colony Bldg., Chicago, Ill.

This is a very excellent and useful catalog containing drawings of Smith mixers of various sizes and styles. The book also contains a dozen or more designs of concrete mixing plants. These designs are for different sizes of plants and are for different local conditions and are of suggestive value in designing such plants for any location.

Gas Engines and Gas Producers.—Paper, 9x6 ins., 16 pp.

Gas and Gasoline Engines.—Paper, 9x6, 32 pp. are also given.

Fans.—Paper, 6x9 ins., 20 pp.

The Backus Water Motor Co., 98 Vanderpool St., Newark, N. J.

The catalogs here mentioned and published by the company are excellent. The gas engine and producer catalog contains illustrations and descriptions of gas producer plants for manufacturing gas particularly adapted to gas engine use. Also the gas engines of different types manufactured and tables of comparative operating costs. The gas and gasoline engine catalog contains a complete line of engines which are all of the horizontal four-cycle type and slow speed. The catalog of fans gives good descriptions and cuts showing exhaust fans and applications. Tables of sizes, speeds and prices

Railway Motor Cars.—Paper 6x9 ins. 30 pp. Catalog No. 101 B. Fairbanks, Morse & Co., Chicago and New York City.

This catalog gives illustrations and descriptions of gasoline motor cars for railroad work. The pamphlet covers all kinds of handcars and inspection cars, and also the more recently developed cars for passenger service.

Explosions.—Paper 4x9¼ ins. 20 pp. Trojan Powder Company, 65 Pine St., New York City.

Cement.—Paper 6x9¼ ins. 8 pp. Vulcanite Portland Cement Co., Philadelphia and New York.

A paper on hair cracks on concrete surfaces with methods of preventing or removing them.

Acme Corrugated Metal Culverts.—Paper 6x9 ins., 16 pp. The Canton Culvert Co., Canton, Ohio.

A catalog of "nestable" culverts made of No-Co-Ro Metal, a non-rusting material.

Roll Crushers.—Paper 6x9 ins, 16 pp. The Jeffrew Manufacturing Co., Columbus, Ohio.

A catalog of crushers for coal coke gypsum, salt, etc.

Reinforced Concrete Construction.—Paper, 6x9¼ ins., 98 pp. American Concrete-Steel Co., Union Building, Newark, N. J.

This is a catalog of illustrations and descriptions of concrete buildings of all kinds which have been built by the above company of Engineers and Contractors. The illustrations also cover the system of reinforcing concrete employed by this company. The catalog is very complete.

Hoisting Engines.—Paper, 8¼x10¾ ins., 28 pp. National Hoisting Engine Co., Harrison, N. J.

This catalog is devoted exclusively to hoisting engines, derricks and accessories. It contains about twenty-five different types of hoisting engines and tables of dimensions, weights, etc.

Leveling Rods.—Paper 3½x9 ins., 48 pp. W. & L. E. Gurley, Troy, N. Y.

This is a very excellent and complete catalog of level rods and lining poles. It contains full page, colored cuts of the various patterns made and carried by this company, together with prices and description of details.

Portable Woodworking Machines.—Circulars 4x9 ins., 8 pp.

Diaphram Bilge Trench Pump.—Circular 3½x6 ins., 4 pp. C. H. & E. Mfg. Co., 321 Mineral St., Milwaukee, Wis.

These circulars illustrate and set forth the uses of the portable machinery which the above company manufactures. The machines are all built to be handled in one piece including gasoline engine. Prices are also given.

Hydro-bar Water Proofing.—Paper 6x9 ins. 20 pp. F. William Stocker & Co., Inc., General Sales Agents, 34 N. 33d St., New York.

A catalog, illustrative and descriptive of the merits of this waterproofing material.

Improvement of New York Harbor.—Cloth 6x9⅜ ins. 60 pp. Joseph Edwards Dredging Company, 16 Exchange Place., New York.

Because of his having designed and managed a plant for use on the Improvement of New York Harbor some years ago, and has received various inquiries relating to the work from engineers and others who are contemplating similar improvements elsewhere, Mr. Joseph Edwards has prepared this book as a means of facilitating the above inquiries. It gives an excellent account of the work covering the necessity for deeper water in Lower Bay, location and character of its channels; their condition before and after the work was done; the estimated and actual cost of the improvement; prices per cubic yard paid for the work; the means and method employed, and a discription of the plant with drawings.

Keystone Cable Drills.—Paper 8½x11¼ ins. 36 pp. Keystone Driller Co., Beaver Falls, Pa., and Monadnock Block, Chicago.

An excellent catalog giving a description of Blast Hole drilling with well drilling machines. All sizes, depths and loading of holes; discription of machines, steam and electrically driven, and price lists.

Water Pipe.—Paper 9x6 ins. 28 pp. The East Jersey Pipe Co.

A very well gotten up catalog containing discriptions and illustrations of both the Riveted and Lock Bar Pipe made by this company. Also a discussion on pipe carrying capacity. Diagrams of safe working pressure for different heads up to 1000 ft., and sizes of pipe up to 96 and 1 1/16 ins. thick are given.

Good Roads Convention in Montana.—A good roads convention is to be held in Billings, Mont., June 16, 17 and 18, for the purpose of discussing ways and means for the improvement of the public highways of Montana and to awaken a more general interest in that state in road building and improvement. The following persons have been named by Governor Norris as the executive committee: W. B. George, I. D. O'Donnell, P. B. Moss, W. S. Garnsey, H. W. Rowley, J. Collins West, E. B. Campbell, Christian Yegen, R. E. Shepherd and W. A. Selvidge of Billings, W. M. Bickford and E. C. Largey of Butte, J. C. McCarthy of Bozeman, Frank M. Smith of Helena, W. R. Allen of Anaconda, A. W. Miles of Livingston, W. A. Talmage of Red Lodge, J. M. Keith of Missoula and C. F. Murphy of Great Falls. A meeting of the executive committee is to be held at Billings, March 19, at 2 o'clock p. m., to make preliminary arrangements for the convention, and for the transaction of such other business as may properly come before the committee.

Forest Products Laboratory.—The opening of the Forest Products Laboratory at Madison, Wis., will take place on June 4. To aid by means of experiments and demonstration in lessening waste in the manufacture and use of wood is the object of this laboratory. The state of Wisconsin has erected for the purpose a new building at the university and will provide light, heat, and power. The Forest Service has supplied the equipment and apparatus and will maintain the force of thirty-five or forty persons required to carry on the work. Through this arrangement the United States has secured perhaps the largest and best equipped wood testing laboratory in the world. The laboratory will be prepared to make tests on the strength and other properties of wood, to investigate processes of treating timber to prevent destruction by decay and other causes, to study the saving of wood waste by distillation processes, and to determine the relation of the microscopic structure of wood to its characteristics and properties. Facilities are at hand in fact for almost any kind of test on wood that practical conditions may require. Lumber manufacturing and wood using industries should make large practical use of this laboratory in finding methods of reducing the waste of wood—a subject of vital concern.

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The New York State Public Service Commission will hold its first hearing at New York city on May 9 on the construction of the proposed new subway rapid transit system for that city.—An important development in the railroad bill situation now under consideration by congress was taken on April 29, when the house adopted the Madden amendment, which provides for the valuation, physical and otherwise, of the railroad properties of the country. Contracts for levee work for the Mississippi Levee Commissioners involving the moving of 927,000 cu. yds. of material were let last week as follows: Roach, Stansell & Jennings, Memphis, Tenn., 527,000 cu. yds.; Dulaney & Foote, Grace, Miss., 252,000 cu. yds.; Clarke & Co., Natchez, Miss., 148,000 cu. yds.—The city of Ashtabula, O., opened bids April 27 for a considerable amount of improvement work to Ashtabula Creek in that city, the Inland Waterways Improvement Co. of Ashtabula at $281,000 being the lowest bidder.—Among the railroad construction contracts let recently are the following: John Marsch, 181 La Salle St., Chicago, for grading of second track for the Elgin, Joliet & Eastern Ry. from Frankfort, Ill., to Matterson, 7½ miles; A. H. Hartigan & Co., Gary, Ind., for grading for second track for the Elgin, Joliet & Eastern Ry. from Griffith to Ivanhoe Sand Pit, Ind., 5½ miles; Newkirk & Powers Construction Co., Joliet, Ill., for masonry work for 13 miles of double track work on the Elgin, Joliet & Eastern Ry.; Cowan Construction Co., for extension of the Oak Point line of the Canadian Northern Ry.; C. J. Murray, for the extension of the Canadian Northern Ry. line west from Prince Albert, and for the line northwest of Prince Albert; Martin, Welch & Co., subcontract from J. W. Stewart & Co., for building 20-mile section of the V., V. & E. Ry. between Abbottsford and Chilliwack; P. M. Johnson Son & Allhands, St. Elmo, Ill., for extending the Buckeye spur of the St. Louis, Brownsville & Mexico Ry. for a distance of eight miles; Holmes & Sharkey, Press & Rush, L. A. Johnson, Jno. Parr and Beatty & Powell, subcontracts from Geo. H. Webster, Alix, Alberta, for work on the Tofield-Calgary branch of the Grand Trunk Pacific Ry. in Alberta; Bean & Jones, Benton Harbor, Mich., for clearing, grading and building culverts between Eau Claire and Dowagiac, Mich., for the Dowagiac Ry. Co.; Fred A. Baxter, Superior, Wis., for grading of Soo Ry. ore line and yards at Superior; Fred T. Ley & Co., Springfield, Mass., for constructing ten reinforced concrete bridges and eight concrete culverts for the electric railway now under construction between Portland, Me., and Lewiston, Me.

This in on Potter.

Down in New York they tell this story on Alexander Potter, the consulting engineer of that city. Mr. Potter be it known is not exactly large in physical build and moreover he is of a very quiet disposition. A little while ago he bought a place in the country and undertook a considerable amount of reconstruction work on it, Mrs. Potter having charge of the job. She bossed the job nearly every day and hired and fired the laborers herself. Laborers were scarce in that neighborhood and pretty nearly every man who came along was sure of a job. None of those who were at work had ever seen Mr. Potter, as he was too busy in town to take more than a Sunday look at what had been done during the week. One day, though, says the New York Press, Potter was out of sorts and decided to stay at home and get close to nature with his wife's gang of Italians. So in the oldest clothes he could find he joined the diggers. He was thinking of what a fine shoveler he was when some one behind him gave him an ungentle kick. He dropped his shovel and swung around. A big Irishman was glowering down at him. "Yees'll fill yer shovel better than thot or ye'll fill yer coat an' git out-a here," the Irishman said in a voice of authority. Potter realized that he had been taken for a new man on the job and made no reply. The next two hours he worked harder than he ever had in his life before. He did not dare quit until Mrs. Potter appeared. At last she came. "You're wanted at the telephone, dear," she called out as she approached. The big Irishman did not quite "tumble" even then; but he did when he saw his new laborer walk off to the house with the "lady boss."

The First Railroad in Illinois.

In 1837 the state of Illinois laid out an ambitious scheme in the way of railroad construction. In that year a bill was introduced in the legislature to build eight lines of railroad: First, the Central from Cairo to Galena; second, a branch of the same, from Hillsboro eastward to the Indiana state line; third, the Southern Cross railroad, from Alton to Mt. Carmel; fourth, the Northern Cross road, from Quincy via Jacksonville, Springfield and Decatur to the Indiana state line; fifth, from Peoria to Warsaw; sixth, from Alton eastward to intersect the Central, though there now seems some doubt as to whether this was not included in the Mt. Carmel-Alton project; seventh, from Belleville to intersect the Southern Cross; and eighth, from Bloomington to Mackinaw, with branches to Peoria and Pekin. As the construction of these eight railroads would have cost the state something like $10,000,000, there was naturally much opposition to the bill. Finally, however, a compromise was effected and the bill was passed, under the condition that the Northern Cross railroad should be built first. The building of the line was placed in charge of the commissioner of the first judicial district and surveys were at once started. The engineers succeeded in getting a good line with practically no curves until they reached Jacksonville. The first survey through that town ran along the northern outskirts where the Wabash R. R. now has its route. Certain of the townspeople objected to this survey, claiming that the selection of this route was due to the fact that the commissioner owned property through which the road was to run. This the commissioner denied and to add strength to his denial had the route changed. Accordingly much to the disgust of the engineers two long transverse curves were interjected into an otherwise straight road, turning the line into West State St., and sending it along the main street and through the central square of the town. It is needless to add that the townspeople were glad enough to get the track back again to the original survey, ten years later. The first locomotive the "Rogers" used on the road was built by Rogers, Grossvenor & Ketchum of New Jersey. It was intended for the Bloomington & Mackinaw R. R., a road which met an untimely end, even before the completion of surveys. As the Northern Cross R. R. had previously ordered a locomotive from the same concern, and as this locomotive had been "lost in transit," the one intended for the B. & M. R. R. was turned over to it. The machine was shipped by sea to New Orleans and then by packet to Meredosia where it was put on the rails on Nov. 8, 1838. Illinois was then something of a wilderness and there was no one who knew how to keep the locomotive in repair. As a result the "Rogers" and another locomotive that was used for a time began to fall to pieces and when in 1844 they were in such shape that they kept people awake by their noise they were discarded, and mule power substituted. The "Rogers" was then turned over by the state to James M. Semple, at that time U. S. Senator from Illinois, to experiment with in carrying out a plan he had devised of constructing a large prairie steam wagon, with which he intended to carry passengers over the great prairies of Illinois. The locomotive was turned over to Mr. Semple near Berlin in the western part of Sangamon County, where after many strange experiences, he was compelled to abandon it within a few hundred feet of the railroad tracks. Here under the influence of the weather and the appropriations of those who wanted a bit of metal or wood it went to pieces.

Cleaning Pipe Sewers.

Pipe sewers are often cleaned by passing a rope through the sewer and pulling it back and forth until the obstructing cause is loosened. To get the rope through the sewer is in some cases more or less of a problem. In some of the Pacific coast cities the sewer officials are said to have pressed the catfish into service as an aid in getting the rope through the sewer. Out there when a sewer gets plugged up, the sewer cleaner goes to the river, catches a catfish, ties a string to its tail and drops it down a manhole into the sewer. The fish at once starts for the river and forces its way through any obstruction not as solid as brick, dragging the string after it. Then the laborer goes to the next manhole and picks up the string which he uses to draw a wire through the sewer, and with this wire a rope is pulled through. "Uncle" Herman Burt, who has been in charge of the sewer system of a Massachusetts city for the past 30 years, uses a somewhat similar plan. In his case, however, he uses a ferret for pulling the string through the sewer. In order to offer some inducement to the ferret to make the trip, a rat is usually let loose in the sewer, and the ferret is said to follow in hot pursuit dragging the string after it. This scheme is reported to have worked well except in cases when the ferret caught up with the rat. When this happened they had to pull the ferret out by the tail and get a new rat.

The Omaha & Council Bluffs Street Ry. Co., of Omaha, Neb., is to have work started at once on its Elmwood Park extension at Omaha. The extension will go from 48th and Leavenworth Sts. to the park entrance, and is to be completed within six weeks.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA.

The San Jacinto Valley Ry. Co. has made surveys for part of its projected 32-mile electric railway from Hemet to Riverside. The capital for construction has been secured and construction contracts will be let within 90 days. J. S. Jackson, San Jacinto, Cal., is interested.

COLORADO.

The Colorado & Southern Ry. is to reballast and lay heavier steel rails on its line between Greeley and Fort Collins. The work is not to be done this year, but probably will be done next year.

The Paradox Pacific Construction & Land Co. is having surveys made for its projected line (Paradox Valley R. R.) from Montrose, Colo., to Paradox, Colo. The line will be about 105 miles long, and the capital for its construction has been secured. Construction contracts are to be let some time in July. Fred L. Lucas, 706 Ideal Bldg., Denver, Colo., is chief engineer, and Carmon Layton, Montrose, Colo., is President.

IDAHO.

The Yellowstone Park R. R. Co. has completed surveys for its projected 40 mile line from Ashton to Driggs, Idaho. The capital for construction has not been secured as yet and the time for awarding construction contents has not been determined. This is an Oregon Short Line project and Wm. Ashton, Salt Lake City, Utah, is Chief Engineer.

ILLINOIS.

The Oil Belt Traction Co. of Oblong, Ill., will be ready about June 1 to let contracts for about 12 miles of good grade work for an electric railroad between Bridgeport and Hardensville, Ill. G. W. Low, Oblong, Ill., is engineer for this company.

The Elgin, Joliet & Eastern Ry. has awarded the contract for grading of second track from Frankfort to Matteson, a distance of 7½ miles, to John Marsch, 181 La Salle St., Chicago. The masonry work on this section of second track has been let to the Newkirk & Powers Construction Co., of Joliet. Contract for grading second track from Griffith to Ivanhoe Sand Pit, Indiana, a distance of 5½ miles, has been let to the A. F. Hartigan Co. of Gary, Ind. Newkirk & Powers Construction Co. also have the masonry work on this job. There will be about 50,000 yds. of grading between Frankfort and Matteson and about 25,000 yds. between Griffith and Ivanhoe.

MONTANA

The Eastern Montana Electric Ry. Co. has completed its preliminary work and now has location work under way. As previously noted, the company projects an 80 mile line from Red Lodge, Mont., via Clark's Fork and Bear Creek. F. A. Kesselhuth, Stapleton Bldg., Billings, Mont., is Chief Engineer. The eastern office of the company is at Room 1006 27 William St., New York City.

OHIO.

J. T. Adams, Railroad Contractor, Columbus, O., is now in Jamestown, N. Dak., where he will let about 30 miles of good scraper work on the Midland Continental Ry; 75 per cent of this is slip scraper work and side borrow and all of it short haul. Good prices will be paid.

PENNSYLVANIA

The Blue Ridge Ry. Co., organized at Waynesboro to build a 2½ mile extension of the Chambersburg, Greencastle & Waynesboro Street Ry., has secured the necessary capital for construction purposes and will let construction contracts this fall. The line is to extend from Pen Mar to Blue Ridge and will require one mile of side cutting on mountain side, which will be heavy work. G. B. Beaver, Waynesboro, Pa., is President, and R. D. Sefton, Waynesboro, is General Manager.

TEXAS.

P. M. Johnson Son & Allhands, with home office at St. Elmo, Ill., has been awarded the contract for extending the Buckeye spur of the St. Louis, Brownsville & Mexico Ry. from its present terminus, Collegeport, a distance of eight miles.

CANADA.

The Algoma Central & Hudson Bay Ry. Co., C. N. Coburn, Chief Engineer, Sault Ste. Marie, Ont., will receive tenders until noon, May 16, for the clearing of right of way, construction of bridges, cleaning of cuts, making up embankment of that portion of Algoma Central & Hudson Bay Ry. main line already graded between present end of steel, mile 69, north of Sault Ste. Marie and Hawk Lake Junction, approximately 100 miles. This work will be let in sections.

Grading work is now under way on the Tofield-Calgary branch of the Grand Trunk Pacific Ry. in the Province of Alberta. This contract was let to Geo. H. Webster of Winnipeg, Man., and work headquarters at Alix, Alberta, as previously noted in this paper. This is prairie work, but is heavy; there is no rock. The contract includes about 3,000,000 cu. yds. of earth excavation, one bridge over Red Deer River, 1,480 ft. long, 140 ft. high, steel with concrete foundation and wood culverts requiring about 2,000,000 ft. B. M. of cedar. The sub-contractors on the work are Holmes & Sharkey, Press & Rush, L. A. Johnson, Jno. Parr and Beatty & Powell.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

Enginers of the Clay Creek Reservoir & Irrigation Co., of Lamar, Colo., are rapidly completing the survey of the reservoir site and actual work on the construction of the system will begin within the next 30 days. The construction work will be done by a firm of Kansas City contractors. The Clay Creek system contemplates the irrigation of 8,000 acres south of Lamar. The capacity of the reservoir will be 11,000 acre feet and about 20 miles of ditch will be constructed. The parties back of this system are contemplating putting in two, and possibly three, systems, each of which will be larger than that on Clay Creek. Announcements in regard to these will possibly be made within the next 30 days. C. M. Scott, Lamar, Colo., is secretary of the Clay Creek Reservoir & Irrigation Co.

The ditches are to have side slopes 1 to 1. The nearest railway stations to the work are as follows: Ditch No. 83, Sandridge, six miles; Ditch No. 90, and laterals, Karlstad, 1 to 8 miles; Ditch No. 91 and laterals, Green-

ILLINOIS.

Bids were received April 25 by Major Thos. H. Rees, U. S. Engineers, Chicago, Ill., for dredging 700,000 cu. yds. in the Calumet River, Illinois. For dredging 445,000 cu. yds. at or near the forks, the following bids per cubic yard place measurement were received, the methods of disposal being as follows: (1) On adjacent shore, (2) in 50 ft. of water in lake, (3) along shore and not more than two miles from mouth of river; Samuel O. Dixon, Milwaukee, Wis., (1) 24 cts., (2) 28 cts., (3) 23 cts.; Duluth-Superior Dredging Co., Duluth, Minn., (1) 23 cts., (2) 28 cts., (3) 24 cts.; the Fitzsimmons & Connell Co., Chicago, Ill., (2) 30 cts., (3) 25 cts.; Great Lakes Dredge & Dock Co., Chicago, Ill., (1) 22.8 cts., (2) 27 cts., (3) 22.8 cts. For dredging 255,000 cu. yds. below the forks the following bids were received: Buffalo Dredging Co., Buffalo, N. Y., (2) 30 cts., (3) 25 cts.; Samuel O. Dixon, Milwaukee, Wis., (1) 25 cts., (2) 28 cts., (3) 25 cts.; Duluth-Superior Dredging Co., Duluth, Minn., (1) 24 cts., (2) 29 cts., (3) 24 cts.; the Fitzsimmons & Connell Co., Chicago, Ill., (2) 30 cts., (3) 25 cts.; Great Lakes Dredge & Dock Co., Chicago, Ill., (1) 23.5 cts., (2) 27.5 cts., (3) 23.5 cts. The bid of the Great Lakes Dredge & Dock Co. was recommended for acceptance.

MASSACHUSETTS.

Bids as follows were received Apr. 23 at the U. S. Engineer's Office at Newport, R. I., for dredging in harbors at New Bedford and Fair Haven, Mass: Coastwise Dredging Co., Norfolk, Va., $9,605; J. S. Packard Dredging Co., Providence, R. I., $9,295.

MICHIGAN.

Love & Nelson, Muskegon, Mich., have been awarded the contract at $33,586, for constructing revetments along Black River on both sides of the channel inside of Government piers. The revetment is to be installed to enable South Haven harbor to obtain benefits of a former appropriation of $279,000 and additional appropriation in present Government River and Harbor Bill.

MINNESOTA.

The State Drainage Commission, George A. Ralph, State Engineer, St. Paul, Minn., will award contracts May 18 for the following drainage work:

bush, 1¼ to 8 miles, and Strathcona, 2 to 4 miles of lateral 11, 12 and 13; Ditch No. 92 and laterals, Margie, 1 to 6 miles. Ditch No. 83 is located in river bottom, open land. Ditch No. 90 and laterals are in open meadow and marsh. Ditch No. 91 and laterals follow old ditch in open meadow and marsh land, and Ditch No. 92 and lateral are through scattering tamarac timber.

The following bids, per cu. yd. scow measurement, were received Apr. 25, at the U. S. Engineer's Office, Duluth, Minn., for dredging in Duluth—Superior Harbor, $20,000 being available for the work: Zenith Dredge Co., Duluth, Minn., 14 cts.; Great Lakes Dredge & Dock Co., Chicago, Ill., 15½ cts.; Duluth-Superior Dredging Co., Duluth, Minn., 12½ cts.

MISSISSIPPI.

Contracts for levee work for the Mississippi Levee Commissioners, W. J. Shackelford, chief engineer, bids for which were opened April 27 at Greenville, Miss., have been let as follows: New levee at Riverton, to Roach, Stansell & Jennings of Memphis, Tenn., 527,000 cu. yds. at 21½ cts.; new levee at Shiloh, secs. 1 and 2 to Dulaney & Foote, Grace, Miss., 252,000 yds. at 16 cts., sec. 3 to Clarke & Co., Natchez, Miss., 148,000 yds. at 16.4 cts.

NEW YORK.

The D'Olier Engineering Co., 121 S. 11th St., Philadelphia, Pa., as previously noted, has been awarded contract No. 90 for work on the New York State Barge Canal. This contract calls for furnishing and installing equipment for operating and lighting locks at Whitehall, Comstock, Smiths Basin, Oswego, Fulton, Baldwinsville, and Phoenix. The work includes: 200 cu. yds. excavation, 310 cu. ft. chipping concrete, 200 cu. yds. forming embankment, 44 cu. yds. second-class concrete, 380 cu. yds. first-class reinforced concrete, 203,000 lbs. structural steel, 24,000 lbs. metal reinforcement, 153,000 lbs. iron castings, plain, 4,400 lbs. iron castings, machined, 21,600 lbs. metal ducts, 200 sq. yds. repaving gutters, 60 lin. ft. wrought iron pipe railing, 10,200 lin. ft. concrete conduit, single duct, 3,720 lin. ft. concrete conduit, double duct, 930 lin. ft. reinforced concrete conduit, double duct, 470 lin. ft. drilling 1½-in. holes for ducts, 280 lin. ft. drilling 3-in. holes for ducts, 500 lin. ft. 3-in. fibre duct, 30 squares roofing, 71,300 lbs. lead-covered rubber insulated conductors, etc.

OHIO.

The following bids were received April 27, by the Director of Public Service of Ashtabula, O., for improving Ashtabula Creek at that city: Buffalo Dredging Co., Buffalo, N. Y., $317,068; Great Lakes Dredging & Dock Co., Cleveland, O., $289,600; The Inland Waterways Improvement Co., Ashtabula, O., $281,000. The work includes approximately, 360,327 cu. yds. of earth excavation; 136,487 cu. yds. of rock excavation, and 2,160 lin. ft. of "I" beam bulkhead.

WYOMING.

E. J. Fisher, Rock Springs, Wyo., has been awarded the contract for constructing the Covey Canal at Cokeville, Wyo. The work includes 80,000 cu. yds. earth excavation, 2,000 cu. yds. rock excavation, 2,000 cu. yds. of embankment, and about 10 bridges.

Right of way and site for a depot have been granted by Secretary Ballinger to the Belle Fourche Valley R. R. at Newell, S. Dak. Surveys through the town were made by the railroad engineers some time ago.

It is now believed that construction work on the proposed Ely-Goldfield R. R. will not be started until late this summer. The reason for this, according to a statement of W. R. Alberger, Los Angeles, Cal., Traffic Manager of Tonopah & Tidewater R. R., given in the Tonopah Sun, is as follows: "There have been some alterations necessary with regard to the original survey which will delay the beginning of the construction of the road. These changes in the survey are now being made, which will not, however, alter the route as surveyed to a great degree. No contracts have been let, nor will any be awarded until a perfect survey is completed. It will probably be late in the summer before the laying of the road-bed will begin."

The Cimarron & Northwestern Co. has received a shipment of ten cars of steel rails for the proposed 9-mile extension of the road from the Ponil into the Bonita Canyon in New Mexico. Engineers are now at work locating the definite right of way for the new work. H. G. Frankinburger, Cimarron, N. Mex., is secretary of the company.

Surveys are under way by the engineers of the El Paso & Southwestern Ry. Co., for the location of a route for an extension from Benson, Ariz., to Tucson and Phoenix. Construction work, it is said, will be started on the proposed road this summer. Walter Douglas, Bisbee, Ariz., is vice president of the El Paso & Southwestern Ry.

Surveys are now being completed for the construction of a line of railroad from Jackson, Ky., through the mountains entering the richest coal fields in the state. Construction work will be started, it is said, this summer, providing all right of way can be secured by the promoters.

The New Orleans Great Northern Ry. is stated to have secured the right of way for its road to enter Jackson, Miss., from the junction with the Illinois Central tracks, four miles south of the city. All surveys have been completed and arrangements made to start the work of grading and track laying. From Negan, the present northern terminus of the Great Northern tracks, to the limits of the city proper is about three miles, from whence the line will parallel the track of the Illinois Central, cross those of the Gulf and Ship Island and the Alabama and Vicksburg and run up the Pearl river front to the property which has been acquired for terminal buildings, yards, switches, round house and such essentials. Eventually it is intended to extend through and beyond the city, passing around the entire front, and thence on up the valley of Pearl river.

According to advices from Jackson, Ky., the Lexington & Eastern Ry. Co. will start work at once on the extension of its line to a connection with the Kentucky River Development Company's line at Quicksand. John Marston, Lexington, Ky., is chief engineer of the L. & E. Ry.

Engineers are at work making surveys for the construction of the Southern New England Railway, the recently chartered Grand Trunk Ry. branch. Three engineering parties are engaged upon the work and are located at Woonsocket, R. I., Webster, Mass., and Palmer, Mass. The entire force numbers 36 men.

The citizens of Abbeville, S. C., have requested the city council to appropriate $1,000 for the purpose of defraying the expenses incident to making a preliminary survey of a feasible route for the proposed trolley line from Abbeville to Due West, or to such point in the vicinity of Due West as shall be deemed best. The engineer is to be secured by a committee appointed by Mayor J. E. Jones of Abbeville.

The Eureka & Palisade Ry., A. R. Randolph, assistant superintendent, Palisade, Nev., is to rebuild the washed out portion of its line.

Preliminary surveys are to be started soon for the Lynchburg, Amherst & Northern R. R., which projects a line from Lynchburg to Amhurst, Va. The road will require the building of three steel bridges. Among those interested in the company are: H. L. Page, president; J. T. Bonney, secretary; H. C. Joyner, J. E. Bowman, C. A. Jubert, Flickley Tucker, W. Ward Hill, C. L. Scott and C. J. Campbell, all of Amherst, Va. Wallace A. Taylor, of Lynchburg, Va., and W. E. Walker, of Sweetbrier, Va.

The Southern Pacific Company has had engineers in Reno, Nev., surveying in the west end of the yards, and has ordered all persons who own buildings on railroad land in that portion of the city, or who are living in houses on the Southern Pacific land to vacate immediately. It is believed that the company intends to build new freight sheds there and to lay more tracks. It also intends to build a new depot and to improve the grounds in the interior of the city.

Reports from Miles City, Mont., state that the Tongue River Ranch Co., which company owns the former A. B. Clarke ranch on the Tongue River, has let a contract to Magnus Svenson for the construction of a rock and brush dam across the river at the head of the ditch which irrigates the ranch, or a portion of it. The ranch is located about 45 miles from Miles City. The ditch in connection is nine miles in length and Mr. Svenson's contract will include cleaning this out and repairing it also.

Engineers of the Tonopah & Goldfield R. R., F. T. Armstead, Engineer Maintenance of Way, Tonopah, Nev., have completed surveys for a route from Tonopah Junction to the Mono Lake District. A feasible route was found.

In a recent interview J. C. Stubbs, vice-president of the Harriman Lines, reported the progress of double track work on the Union Pacific as follows: Work of second tracking has been finished from Omaha to Watson's Ranch, about 201 miles; about 25 miles more has been completed between Kearney and North Platte, and we are going right along to complete the work from North Platte to Julesburg, about 80 miles, and to fill in the gaps between Watson's Ranch and North Platte, about 75 miles. In addition, 20 miles from Cheyenne to Ruford is completed; 40 miles between Lookout and Hanna, Wyo., 60 miles between Rawlins and Wamsutter; 26 miles between Point of Rocks and Blairtown, and 30 miles between Green River and Granger.

Fred T. Ley & Co., Springfield, Mass., has been awarded the contract for constructing 10 reinforced concrete bridges and 8 concrete culverts for the electric railway now being built between Portland, Me., and Lewiston, Me., for Libbey & Dingley, Lewiston, Me. The line will be 35 miles long, and it is expected that the road will be opened to traffic next summer.

The City Council of Chicopee, Mass., has voted to request the Springfield Street Ry. Co., Springfield, Mass., to continue one of its Chicopee Falls lines across the Chicopee bridge and along Montgomery and Sheridan Sts. by St. Patrick's church to the junction of Sheridan and Emmet Sts.

The Newport & Licking Valley Traction Co. has opened offices in Cynthiana, Ky., and is preparing to have the grading work started. All the right of way has been secured and engineers are now reported to be preparing final details for the line between Cynthiana and Paris, Ky.

The Charleston Ry. & Lighting Co., has been organized with a capital stock of $2,000,000 to take over the Consolidated Ry. Gas & Electric Co. of which P. H. Gadsden, Charleston, S. C., is president. It is reported that a number of improvements will be made in Charleston.

W. H. Fox, superintendent, Tennessee Central, Nashville, Tenn., has submitted a proposition to a committee of citizens of DeKalb county, offering to construct an extension from the main line to Smithville and onto Chattanooga, Tenn., providing the county will vote to take stocks amounting to $150,000, and issue bonds for that amount.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

W. J. Cameron, G. C. Kelly, and F. G. Anderson have applied to the city council of Birmingham, Ala., for a franchise to build street car lines in the principal streets of the city.

The city council of Birmingham has granted a franchise to the Birmingham Railway, Light & Power Co. to construct an extension to the suburbs of Corey. Work on the line, which also is to extend to Ensley, is to be started soon.

The Dauphin Island Ry. & Harbor Co. has been formed at Birmingham, with a nominal capital stake of $3,000. The objects of the company are to establish a coaling station on Dauphin Island, at the mouth of Mobile bay, the dredging of a 30-ft. channel from Mobile bay to Dauphin bay being included in the plans. The charter granted authorizes the company to engage in a general railway business, as well as the establishment of other means of transportation. The temporary offices of the company will be in Birmingham, J. M. Dewberry of that city being agent. Officers and incorporators are: George T. Bishop of Cleveland, O., president; F. F. Graves of Chicago, vice president; J. M. Dewberry of Birmingham, secretary; Frank H. Senn of Cleveland and D. E. Mitchell of Lebanon, Tenn., directors.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Cotton Belt (St. Louis Southwestern) has instituted condemnation proceedings for the building of its new shops at Argenta.

Commercial Club of Nashville, Ark., is taking up the matter with other organizations of securing the extension of the Louisiana & Arkansas R. R. from Hope, via Columbus, Nashville and Lockesburg to De Queen.

The Hot Springs Glenwood & Western R. R. Co., has been incorporated with a capital stock of $75,000 and proposes the construction of a railroad from Glenwood in Pike County to Caney in Montgomery County, a distance of 6 miles with an ultimate intention of extending the line to Hot Springs. The incorporators are A. L. Clark, J. A. Bonner, W. E. Mayher, C. T. Crosby and S. W. Pryor. A portion of the required capital amounting to $12,000 has already been subscribed.

Advices from Rector, Ark., state that S. P. Weigart and associates are taking steps to secure the construction of an extension of the Kennett-Piggott Railroad to the proposed townsite in Blue Cave township, Clay County.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Thomas W. Forsyth has asked the board of supervisors of San Francisco to offer for sale a franchise for an electric railroad to commence at the intersection of Parnassus and Third Aves., along Parnassus Ave. to J St., and along J St. to Pacheco St.

The Riverside Portland Cement Co. of Riverside is reported to have been awarded the contract by Los Angeles county for furnishing 100,000 tons of crushed rock for the highway work for 70 cts. a ton on board of cars at Riverside. The board of supervisors has already contracted to buy 76,000 tons from the same company at the same price.

The Northern California Power Co. has brought condemnation suits at Redding to acquire the last of the land needed for its projected storage reservoir. The company proposes to make a storage reservoir of 1,540 acres on Dry Burney Creek, eight miles from Kilarc in a straight line. A dam 38 ft. high will be built and this will restrain water to a depth of 35 ft. over this 2½ square mile area. The power company has a power plant at Kilarc that generates 4,000 h. p. It is proposed to increase the capacity of the Kilarc plant to 7,000 h. p. and build an auxiliary plant down stream, using the same water again, and generate 4,000 h. p. The proposed reservoir is eight miles from Kilarc in Dry Burney Creek basin. A tunnel 7,000 ft. long will be dug through the divide between Old Cow Creek Valley and Dry Burney Creek basin to convey the water.

Announcement has been made that the Los Angeles Pacific Electric Ry. intends to four track its entire route from Los Angeles over the short line to Santa Monica within the near future.

The directors of the Bear Valley Mutual Water Co. have accepted the plans of John S. Eastwood, C. E., of Fresno, for the new dam which is to be built about 150 ft. below the present dam. It will be 65 ft. high and will cost $80,000. It is known as the multiple arch type and eight arches will be used to span the canyon. Work is expected to start at once with Engineer Eastwood in charge, and to be completed by Sept. 1 of this year. The new dam will double the capacity of the present Bear Valley Lake.

The Sacramento Riverside Bath Co. intends to erect a wharf on its river front property, a short distance below Sacramento. The company already has a spur track close to the front from the Sacramento Southern R. R. The wharf may be erected this year.

The Sacramento & Yolo Belt Line Co. has been incorporated with a capital stock of $50,000, of which $500 has been subscribed, and proposes to build a belt line of railway within the corporate limits of the city of Sacramento and in the county of Yolo. The principal place of business is Sacramento. The directors are W. A. Curtis, Charles R. Root, H. A. Reed, D. A. Lindley, and Charles Wesley Reed of Sacramento.

The Atchison, Topeka & Santa Fe Ry. (Coast Line) is to enlarge its shops at San Bernardino. Work is to begin at once on the main shop, which will have outside dimensions of 100x500 ft., and will cost $250,000.

An application is to be made shortly to the County Supervisors for a franchise for an interurban road between Fresno and Coalinga. It is stated that the road has already been financed and that construction work will be started Sept. 1. H. P. Knight of the Hughes Hotel, Fresno, is said to be interested.

A permanent organization to be known as the Twin Peaks Tunnel and Improvement convention, having for its object the speedy construction of a tunnel through Twin Peaks to the outlying district, has been formed at San Francisco. It is estimated that the tunnel could be built for $1,800,000. C. F. Adams, San Francisco, is Secretary.

Advices from Lodi state that the Valley Spring R. R. is to be extended to the heavy lumber regions of the Sierra Nevada Mountains, going by way of the celebrated Calaveras Big Trees, and in time connecting with some line west of the Rocky Mountains.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of East Greeley are to petition the Greeley Street Ry. Co. to extend its street car line east in 13th St.

The voters in the Riverside Irrigation District in Morgan County will vote May 14 on the proposition for constructing a reservoir on Wild Cat Creek, six miles north of Fort Morgan. The dam will be 5,345 ft. long, 80 ft. at the highest point, with a 16-ft. crest. The reservoir complete will water 30,000 acres in Morgan County and cost $750,000. Canfield & Shields, Fort Morgan, are interested.

The Missouri Pacific and Denver & Rio Grande Railroad officials are taking up the matter at Denver of constructing a double track line between Pueblo and Wallsenburg, a distance of 55 miles. The estimated cost of the work is $1,500,000. J. G. Gwyn, Denver, Colo., is Chief Engineer of the Denver & Rio Grande R. R.

The Denver & Intermountain R. R. Co., Denver, Colo., is to expend $150,000 in improving road beds and straightening its lines.

The San Luis Southern Ry., recently completed from Blanca, Colo., on the Rio Grande River, to San Acacio, New Mexico, is planning the extension of the line southward through New Mexico at once.

The city council of Durango has at last granted a franchise to the Southern Pacific R. R. for right of way through the city. Durango has raised over $100,000 for the line and it is believed that the company will build into the city by April 1, 1911.

The Northern Colorado Power Co., Charles Williams, general manager, Mercantile Bldg., Denver, has decided to commence immediately the construction of a power transmission line into the Greeley section from the company's plant at Lafayette. All of the towns along the Union Pacific railroad will be reached by the new line. The approximate cost of the contemplated improvement to the company's service is $200,000.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

At a recent meeting of the stockholders of the projected Wrightsville, Adrian & Lyons R. R., the following officers were elected: T. J. James, Adrian, Ga., president; W. F. Staten, Odrian, secretary; E. J. Summer, Wrightsville, Ga., treasurer.

The stockholders of the Middle Georgia Interurban Ry. Co., S. P. Smith, Secretary, will meet at the company's office in Atlanta on May 6, to act on the issuance of $200,000 of stock and $50,000 of bonds.

The Brinson Railway of Georgia, is to be reincorporated with a right to issue $500,000 of preferred stock. The new name will be Brinson Railway Co., as it has taken over the Savannah Valley Railroad Company since its organization. G. M. Brinson, Springfield, Ga., is President and General Superintendent of the company.

The Valdosta Street Ry. Co., W. S. West, President and General Manager, Valdosta, is to extend its line through several streets at Valdosta and form a belt line.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boise & Interurban Ry. Co., W. E. Pierce, president, Boise, Idaho, is planning to extend its tracks to Eastside addition and points beyond the Natatorium at Boise, the work including a double track up Warm Springs Ave. from a point near the Masonic cemetery.

Owners of the Mineral Point mining property at Osburn have decided to run a cross cut tunnel, 1,500 ft. long. W. B. Forrester, Osburn, Idaho, is in charge of the work.

The International Railroad Co. has filed articles of incorporation for the Coeur d'Alene & Pend d'Oreille R. R., an extension of 10 miles from the main line to Coeur d'Alene and from the main line to Lake Pend d'Oreille, a distance of 15 miles. The new company is capitalized at $600,000, and the incorporators are Austin Corbin, Albert Allen, G. H. Martin, E. J. Roberts and A. H. Sperry. The headquarters are at Spokane, Wash.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Joliet & Southern Traction Co., H. A. Fisher, president, Joliet, will expend about

$150,000 this season in Joliet for improvements. These will include the construction of the Jackson St. line connecting up the terminals in Joliet with the main line on East Jackson St. One-half mile of this line has been built and lying idle for two years, held up by track elevation and the Jackson St. viaduct. Most of the material for completing the line has been on hand for the same length of time

The Woodstock & Sycamore Traction Co. is laying steel on its division between Sycamore and Genoa, and it is expected that this part of the line will be in operation by July 1. The greater part of the work has already been done between Genoa and Woodstock. Grading, fencing, bridges, etc., have been completed. The work is about two-thirds done and it is expected that the entire road will be in operation in a short time.

The Consolidated Dredging Co. of Chicago has been incorporated with a capital stock of $5,000 and proposes to engage in a general contracting business, the incorporators being Philip Clarkson, Charles B. Elder, and William Eliot Furness.

Advices from Rockton state that Chicago capitalists, headed by Bradner Smith & Co., paper manufacturers, Chicago, will invest $1,000,000 in building a dam across Rock River at Rockton, Ill., to develop electricity.

The Steven Construction Co., of Chicago, has been incorporated with a capital stock of $25,000, and proposes to engage in contracting in concrete and cement construction. The incorporators are Archibald F. Steven, Grant Forbes, Robert B. Steven and M. J. McGlone.

City Council of Wilmington, Ill., has granted the Illinois Light & Power Co., a franchise for 50 years to do business in that city providing the company will construct within the next five years, an electric interurban railway between that city and Kankakee, Ill.

The McGrath Construction Co. has been awarded the contract for the transportation of the materials necessary for the construction of bridges and culverts along 90 miles of the Chicago & Northwestern Ry. Cutoff between Sparta and Milwaukee, to be built by Bates & Rogers, 355 Dearborn St., Chicago, Ill. The materials will be hauled from Westfield, Packwaukee, Monello and other stations along the Northwestern and Illinois Central Railroads, and will require the use of 150 teams of horses eight months and two hauling engines. The cost of the transportation is alone estimated at $200,000.

Reports from Chrisman, Ill., are to the effect that the Cleveland, Cincinnati, Chicago & St. Louis R. R., will at no distant date commence the construction of the double track between Paris and Danville, Ill. W. B. McLaughlin, Mattoon, Ill., is Engineer Maintenance of Way.

G. P. Connell, who has the contract for the construction of the Northwestern Yards at Nelson, Ill., reports that the work will necessitate an expenditure of approximately $100,000.

Surveys have been started for the terminal work on the Northwestern Ry. at Fulton, Ill., mentioned in our last issue. The work as proposed will include 35 miles of switch tracks and a round house with 65 stalls, 900 acres of land being purchased for the work. W. C. Armstrong, Chicago, Ill., is Terminal Engineer.

The Big Four has made preliminary surveys between Danville and Ridgefarm for the double tracking of its line between these two places.

The Chicago, Burlington & Quincy Ry. is planning to make extensions to its yards in Galesburg. The work is to be done in June and July.

The East Side Park Commissioners of East St. Louis, have secured options on nearly all the land that was formerly Pittsburg Lake, and which has been drained by the canal now nearly completed. These options have been secured with a view of building an artificial lake about three-quarters of a mile wide and two miles long, around which will be built a tree-bordered boulevard, which may also be used as an automobile speedway.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Contracts for all the crushed stone for concrete on the Evansville & Mt. Carmel extension of the Big Four have been awarded to the Eichel Stone & Lime Co. of Evansville. The contract for sand and gravel was awarded to the Evansville Sand & Gravel Co. The orders are for immediate delivery.

The purchase by the Terre Haute, Indianapolis & Eastern Traction Co. of a majority of the stock of the Indianapolis Traction & Terminal Co., as mentioned in our last issue, will result in the erection of a power house at Indianapolis of a capacity of 40,000 k. w. The station will be erected on a plot of ground ten acres in extent, on the north side of West 10th St., immediately west of White River. Plans for the plant have been drawn already and the contract is to be let immediately. The structure will be of brick and steel construction.

The Bedford Power Co. of Bedford, is planning to construct a hydro-electric plant on the south fork of the White River at a point about 12 miles from Bedford. The work will cost about $250,000. J. W. Esterline, Lafayette, Ind., is the Engineer.

An announcement was recently made in Greenfield, Ind., by J. H. Crabb, promoter of the proposed Circuit Traction Company, that bonds for the proposed line had been sold and matters looking toward its construction were progressing rapidly.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boone Electric Co., John Reynolds, manager, Boone, has been granted a 25-year franchise by that city for the street railway system and light plant. Extensive improvements will be made at once, it is said.

A construction company is to be organized by August E. Steffen and Charles Kindt of Davenport, Ia., and R. C. Campbell of London, England, and New York, for the purpose of constructing the Iowa City-Ottumwa interurban line. All surveys for the line have been completed and all right of way secured, and it is reported that the interurban company has secured the necessary capital for the construction of the line. Roscoe Wilson, Iowa City, is secretary.

The Chicago, Rock Island & Pacific is to expend about $50,000 this year for improving its yards at Cedar Rapids. Grading work has been started.

The Chicago & Northwestern Ry. has awarded a contract to the LaCrosse Dredging Co., LaCrosse, Wis., to dredge out enough material from a sand bar by hydraulic process to put in a fill from 5 to 6 ft. deep and extending over a large portion of the lowland acquired by the Northwestern between Fulton and East Clinton during the past few months. The tract of land is to be converted into storage yards during the coming year.

The Fort Dodge, Des Moines & Southern R. R., J. L. Blake, General Manager, Boone, has begun to electrify the Crooked Creek railroad, extending from Lehigh in Webster County to Webster City. The road, which is about 25 miles long was purchased recently by the Fort Dodge, Des Moines & Southern road, which now has a road running from Fort Dodge to Judd. The road is intended to eventually connect the former steam road with Fort Dodge.

According to advices from Eldon, Ia., the Chicago, Rock Island & Pacific R. R. Co. will commence construction work this summer on the proposed Eldon-Libertyville cutoff. The tracks through Eldon will be raised 12 ft., eliminating all grade crossings. The work which will require about two years' time for completion, will cost, it is estimated, about $3,000,000. The heavy grade will be reduced to about 8 per cent and trains will not require pushers.

Walter Ray, president of the Ocala & Southwestern Ry. has petitioned the city council of Ocala, Fla., for a right of way through one of the city streets in the extreme western portion of the city.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Yankton & Southern Ry. Co., which projects a 1,000-mile north and south railroad from Yankton, S. Dak., is reported to be making good progress in financing its proposed line. Fremont Hill, Wichita, Kas., president of the company, recently returned from an 18-month trip in Europe in the interests of the company. The route for this road was surveyed some time ago. The survey from Yankton runs practically straight south along the sixth principal meridian west from Washington until it reaches the south line of Kansas. On this route it passes through David City, Norfolk, and Fairbury in Nebraska; Washington, Clay Center, Abilene, Newton, Wichita, and Wellington, in Kansas; then swinging east, through Weleetka and Atoka, in Oklahoma, and Palestine, Houston, and Galveston, Texas.

The Air Line Construction Co., with headquarters at Kinsley, Kan., has been incorporated with a capital stock of $200,000, and proposes the construction of steam and electric railways and to equip them with telephone and telegraph lines. The incorporators are M. C. Tubbs, Kinsley, Kan.; W. F. Brown, Marion, Kan.; T. E. Luttgerding, El Dorado, Kan.; M. J. Cudney, Belpre, Kan.; George Smith, St. John, Kan.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Dowagiac Ry. Co., a subsidiary branch of the Benton Harbor-St. Joseph Ry. & Light Co., has begun condemnation proceedings to secure the last piece of right of way for its ten mile spur from Eau Claire to Dowagiac. Construction work is said to be already under way.

Frederick J. Hepburn of Lima, O., has been appointed as general manager of the Saginaw-Bay City Railway Co., which includes the Bay City and Saginaw street railways and the interurban connecting the two cities.

The Ashland Light & Power Co. of Ashland, Wis., has taken over the electric light plant at Bessemer, Mich. As soon as the franchise applied for is granted the building of a street railway from the western limits of the city through to Wakefield will proceed. The line will take in the several mining locations between the two places. Power for operation will be procured from Copper Falls on the White River, 20 miles west of Bessemer, where the power plant is now under construction.

Bean & Jones, Benton Harbor, Mich., have been awarded a contract by the Dowagiac Ry. Co., for the clearing, grading and building of culverts of the line between Eau Claire and Dowagiac. The distance between Eau Claire and Dowagiac is ten miles.

William H. Osmun, Pontiac, Mich., has a plan under way and has been promised the right of way for a steam railroad to connect Pontiac with the Michigan Central lines at Utica. The line would be about 12 miles long.

Bids were opened April 20, at South Haven, for the improvement of the harbor at that place, the following bids being received: Love & Nelson, Muskegon, Division No. 1, embracing 1,390 lin. ft., $17,236, or $12.40 per lin. ft. Division No. 2, 700 lin. ft., $7,350, or $10.50 per lin. ft. Division No. 3, 600 lin. ft., $9,000, or $15 per lin. ft. Total $33,586. The Fitzsimmons Connell Co., Chicago, Division No. 1, $14 per lin. ft., or $19,460; No. 2, $12.50 per ft., or $8,750; No. 3, at $16.00 per ft., or $9,600. Total $37,810.

The Grosse Isle R. R. Co. has been incorporated and proposes to operate a steam or electric line from Detroit to Grosse Isle, over a bridge, franchise for the construction of which has been secured by the organizers of the company. Among those interested are Edward Voigt, Henry P. Borgman, Kirkland B. Alexander, and Wallace E. Brown, of Detroit, and ex-Justice Riopelli of River Rouge.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Northern Dredge & Dock Co., Duluth, has been awarded the contract for dredging of Ontonagon Harbor on the south shore for the U. S. government, the contract amounting to $5,000.

The commissioners of Freeborn county, Albert Lea, Minn., according to reports, will on May 4 take action on a proposition to buy a $1,000 suction dredge to clear and keep free the county ditches, and possibly to dredge shallow places in Fountain, Albert Lea, and other lakes.

The Great Northern Ry., D. M. Philbin, Superintendent, Superior, Wis., is to build a 6-stall round house at Grand Rapids, Minn.

Duluth and the Ranges.

BY PETER E. MEAGHER.

J. A. Higgins, contractor on the Soo Line, was a caller recently and reported his work in very good condition.

C. J. A. Morris of Morris & Shepard, Contractors, St. Paul, Minn., spent a couple of days with us last week. All of their team work is in excellent condition, and their railroad work at Stanley, N. Dak. has got very nicely started. They have this line practically covered, but have one or two more nice pieces of machine work left. Anyone looking for work of this kind, by addressing them at St. Paul, Minn., will get full information.

H. J. Cooper, the Iron Range Contractor, came in last week, and we sold him a J. I. Case Steam Road Roller to be used on his street contracts the coming season.

J. E. Long of Erickson & Long, railroad contractors, called in to see us a few days ago. They have five different contracts on the Great Northern R. R. at the present time, and are working quite a few men.

P. G. Pastoret and Dave Lawrence of the Pastoret-Lawrence Co., general contractors, were visitors with us last week. They have sewer, water works, and street paving contracts under way at the present time at Grand Forks, N. Dak., Rice Lake, Wis., Duluth, Eveleth, Gilbert, Marble and Coleraine, Minn. They have started all of these jobs and are rushing the same to completion as fast as possible. Pastoret-Lawrence Co. are one of the largest general contracting firms in this section of the country, and have been very successful.

O. A. Lewellen, General Agent for the Northwest, with headquarters at Minneapolis, for the J. O. Case Co., manufacturers of road rollers, traction engines and portable boilers, spent a couple of days here with us recently, looking up trade in his line.

George E. Slater, representing the Carnegie Steel Co., Illinois Steel Co., and the Tennessee Coal, Iron & Railroad Co., spent a few days in this vicinity recently. He reported the demand for steel rail and structural steel very good, and the outlook for the future in his line was very bright.

Frank Thomas and James McCoy of Thomas & McCoy, contractors, was a caller here recently. They are not doing anything at the present time, but are figuring on several jobs, which if they are awarded, will start on at once.

Foley, Welch & Stewart, general contractors, were awarded a contract by the Soo Railway Co. for a coal dock to be erected at Superior, Wis., to cost $350,000. They will start on this work at once.

Arthur Mitchell, General Superintendent for this territory for MacArthur Brothers Co., was a caller here last week. He reported their work as being in very good shape.

W. S. Charles of Jones Brothers, railroad contractors, was a caller here this week from Cincinnati, O. He was up here looking over the stripping contract that they have at the Crosby Mine on the Iron Range. He said that their work throughout the country was in very good shape.

W. H. Peterson, team contractor, was a caller at this office this week, and reported that he had taken a subcontract for 100,000 yds. of work from Peter Shugart on the Northern Pacific Railway in North Dakota, and was going to ship his outfit on the same at once.

Howell Lloyd, representing the Knox Manufacturing Company, manufacturers of couplings and valves, Philadelphia, Pa., was a caller at this office last week. He was up in this section of the country calling on the users of the line that they manufacture.

William Donald, who was Superintendent in charge of one of MacArthur Brothers stripping contracts on the Iron Range near Duluth, resigned his position last week and left for Chicago.

J. Newville has taken a subcontract from Morris & Shepard at Stanley, N. Dak., and has already started two machine outfits on the same.

The labor situation in Duluth and vicinity at the present time is in quite a healthy condition. There is a great demand for men, and just enough men to fill the positions offered, although the men are quite independent, and are particular as to just what kind of work they wish to take. There is a lot of construction work going on here at the present time, and a great deal more in sight. And, from the general outlook at present, the year 1910 will be one of the most prosperous we have had here for some time.

Contractors and others interested in the Equipment and Employment business are cordially invited to call at the offices of Peter E. Meagher, 409 West Michigan St., when they are in Duluth.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

J. H. Van Brunt, St. Joseph, manager of the company which is to build an interurban electric line from St. Joseph to Savannah, is closing deals for right of way and it is expected that construction work will be started soon. The chief engineering feature of the line will be a 500-ft. steel trestle, 100 ft. high, spanning Dillon Creek, 1½ miles south of Savannah.

The Chicago, Milwaukee & St. Paul R. R. has bought four acres of land adjoining and directly north of its yards in Chillicothe and thus has given rise to the report that the railroad was to enlarge its yards, or was to remove its yards from Laredo to Chillicothe.

Advices from Carthage, Mo., state that all of the stock for the proposed interurban railway between Carthage and Springfield has been susbcribed, and all right of way secured. Orders have been placed for 45 miles of rail and construction work is to be started. The survey made by the Western Traction Co. several years ago from Carthage to Sarcoxie, Peirce City, Monett, Verona, Mount Vernon, Aurora, and thence to Springfield, was followed.

The directors of the Mexico-Perry Traction Co., which is building from Mexico to Hereford, Callaway county, have notified the Columbia Commercial Club that they will make a proposal looking toward building into Columbia.

Announcement has been made that construction work on the first section of the St. Louis-Kansas City Electric Ry. will be started in six weeks between Columbia and Harrisburg, a hamlet in Northern Boone county. This road will tap the Harrisburg coal fields. The St. Louis-Kansas City Electric Railway Co. has leased over 10,000 acres near Harrisburg and will open three mines when the road is built to that town. The shops will be located at Columbia.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to reports circulating in Bozeman, Mont., work is progressing rapidly on the Three Forks extension of the Gallatin Valley Ry. Contracts for grading have been let as follows: J. N. Brown, 7 miles; A. Perkins, 7 miles; Logan Whittaker, 4 miles. It is expected that all grading will be completed by Oct. 15.

Contractors are making rapid progress on the grade work for the double tracking of the Northern Pacific from Missoula, Mont., and Desmet. The heaviest portion of the work has been completed and the remaining consists of a few light fills and shallow cuts. The completion of this section, which includes the construction of a 3-track concrete bridge over the Rattlesnake Creek, will give the Northern Pacific company a double track line between Garrison and Desmet, a distance of 76 miles.

According to reports from Dillon, Mont., R. H. Jones and A. L. Wright, promoters of the proposed railroad in the Big Hole Basin, are making preliminary surveys for the line and collecting data on general resources.

According to a statement recently made by W. H. Smead, Missoula, Mont., an electric road to connect Missoula and Kalispell will soon be constructed and right of way and route are now being looked up.

Officers and Directors of the proposed railroad between Butte, Mont., and Boise, Idaho, are at present considering two routes between the cities. According to the present preliminary survey, the line will lead from Butte, Mont., to a point below Silver Bow Junction, and from there will parallel the Oregon Short Line to a point near Divide, where it will cross the Big Hole River pass through Wisdom over the Bitter Root Range to Salmon City, Idaho. The change under consideration would carry the line from Butte down Silver Bow Creek nearly to the Mouth of Mill Creek, thence through the Continental Divide by way of French Gulch, crossing the Big Hole River at Ralston, where it would coincide with the original survey. S. H. Bracy, 1606 Tribune Bldg., Chicago, Ill., is interested.

Surveys have been started at Ralston, Mont., for a railroad between Anaconda, Mont., and Wisdom. The surveys are being made under the direction of Thomas M. Ward, C. E., of Spokane, Wash. Preliminary surveys made previously are reported to have found a grade of less than 2 per cent over the grade between Anaconda and Ralstons.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Public Service Commission of New York city, as noted in our last issue, is to begin hearings shortly for the building of new subways in that city. Public hearings on the form of contract for the Broadway-Lexington Ave., the Canal St. line, the Broadway-Lafayette Ave. loop line in Brooklyn, and the extensions of the 4th Ave. line will take place on May 9 and May 16. This means that contracts are to be let in the near future for subways to cost over $125,000,000, and not simply for the $70,000,000 Broadway-Lexington Ave. line. As soon as the hearings on the form of contract are disposed of the advertising of the contracts is the next step. This will begin about June 1 and will continue for 90 days, so that bidders may have sufficient time to formulate their bids.

The Third Ave. Ry. Co. of New York city has been incorporated with a capital stock of $16,590,000. The company is a reorganization of the Third Ave. company, formed by interests which bought the property of the old company at the special master's foreclosure sale March 1.

The Western New York & Pennsylvania Traction Co. has applied to the State Public Service Commission for permission to increase its capital stock, and this has given rise to the report that the company will this year build its proposed extensions along the Erie to Forestville and thence to Dunkirk.

The Boston & Albany R. R., M. B. Freeman, chief engineer, Boston, Mass., has petitioned the State Railroad Commissioners for authority to issue $2,000,000 of 4 per cent 25-year bonds, dated May 1, 1910, the proceeds to be used for additions and improvements to the property.

The matter of constructing an electric railway from Glens Falls to Argyle, is proposed, and V. R. Coon, Elizabethtown, N. Y., General Manager of the Elizabethtown Terminal R. R., has the matter under consideration.

The Buffalo, Rochester & Pittsburg Ry., E. F. Robinson, Chief Engineer, Rochester, N. Y., is reported to be considering building a

branch to run from Saltvale through Warsaw to Bliss. The object of the branch line is to reduce distance and save mileage. It is 20 miles from Warsaw to Bliss by the present line, while it is less than 12 miles in a direct line. The proposition seems to be to build a branch line from the main line at Saltvale, down the valley through the village of Warsaw and up through Wethersfield Springs and Wethersfield Center to Bliss.

The Elmore & Hamilton Contracting Co. of Albany, is reported to be making good progress on its double track work for the Albany Southern R. R., near East Greenbush, N. Y.

The Boston & Albany R. R., F. B. Freeman, Chief Engineer, Boston, Mass., is said to be planning to have work started on a second double track tunnel at Canaan on the main line. This new tunnel will be separated from the present tunnel by a solid wall and will be 500 ft. in length but on a much easier grade. It is to be used for eastbound freight trains exclusively.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Northern Ohio Traction Co., Wm. Christy, vice president, Akron, is to make a number of extensions in Akron provided the city will extend the franchises of the company for 25 years.

General R. P. Kennedy of Bellefontine, Judge H. T. Mathers of Sidney, John T. Adams, a contractor of Columbus, and three Philadelphia capitalists inspected a proposed right of way for a Bellefontaine and Sidney traction line. The right of way secured touched De Graff, Quincy, Silver Lake, Port Jefferson, and Pemberton.

William H. Luchtenberg & Co., Columbus, have started work on the construction of the Toledo & Ohio Central and the Hocking Valley crossings over Rich Town, State and Broad Sts., at Columbus. It is hoped to complete the work by Dec. 1.

The village board of Crooksville has passed an ordinance granting a franchise to the Southeastern Traction Co. to extend its track through the village. The right of way granted the company extends along State St. to the corporate limits. The Southeastern Co. asked for the right of way with a view to extending its lines to New Lexington, and possibly on to Lancaster. The right of way has been secured along the greater part of the contemplated route.

The commissioners of Fairfield County held a meeting at the court house at Lancaster on April 27 to take definite steps for straightening the channel of the Hocking River.

The R. B. Gordon, the dredging boat which is to be used in straightening the Wabash River, was formally launched on the St. Marys reservoir on April 20. The dredge is named after former Congressman Bob Gordon, who has taken the contract to straighten out the Wabash and remove the obstructions. The dredge is 100 ft. long and 40 ft. wide.

The Pennsylvania R. R. is stated to be planning to construct a new yard at Austinburg for its Pittsburg, Youngstown & Ashtabula branch line. This branch is also to be double tracked and it is said that work on this will be started late in the summer. The first part to be double tracked will be the line between Ashtabula and Austinburg. It is said that the grade of the P., Y. & A. will be lowered.

The city council of Cleveland has adopted a resolution calling upon the city engineer to prepare plans and estimates for the elimination of Collision and Irishtown bends in the lower Cuyahoga River, an improvement that will mean an expenditure of from $1,500,000 to $1,750,000. A. B. Lea, Cleveland, is director of public service.

The Hunkin-Conkey Construction Co., Cleveland, has been awarded the contract for constructing a 100 ft. pile and timber dock on the river near the Merwin Ave. bridge at Cleveland for the Cleveland Builders' Supply Co.

The Lake Shore & Michigan Southern Ry. will have work started shortly on a portion of the Oil City branch of the J. & F. division. The part to be double tracked this year will be between Polk Junction and Sandy Lake, a distance of 28 miles.

The city council of Cleveland is to be asked to set aside a site for the construction of a harbor for yachts and motor boats near the bath house in Gordon park.

The new owners of the Marietta, Columbus & Cleveland R. R. have had surveys completed for the extension of the road from Palos Junction to Athens, where a connection will be made with the Hocking Valley, and it is said that construction on the extension will begin this season. J. C. Reddell, Marietta, is General Manager.

The Hocking Valley Ry., F. B. Sheldon, Chief Engineer, Columbus, O., has engineers in the field surveying routes for an extension from Jackson or Wellston to the Ohio River and a connection with the Chesapeake & Ohio Ry. The route now being surveyed is quite different from that which had been rumored would be that of the extension. The present survey parallels the Detroit, Toledo and Ironton to Cone Station from Jackson and from Cone runs down the Little Scioto to Sciotoville, four miles above Portsmouth, where it is said that the Ohio River will be bridged and a connection made with the Chesapeake and Ohio. The river can be bridged to much better advantage near Sciotoville than at Portsmouth and there is plenty of room on both sides of the Ohio for terminals. It is also said that a route will be surveyed to Huntington and that the extension will be built on the line which proves the most feasible. The Portsmouth route is the shorter of the two, and it is said that better grades can be obtained on it.

According to an agreement between the city of Crooksville, Ohio, and the Southeastern Interurban Co., the proposed line will be constructed through the city by July 15, thus making the prospects bright for an extension of the line to New Lexington and possibly Lancaster, O., this summer.

It is reported that active construction work will be started at once on the proposed Cleveland & Pittsburg R. R. double track south of Alliance, O. Headquarters of the engineers and construction officials will be at Alliance.

The Lake Erie & Pittsburg R. R. which has under construction a line from Youngstown, O., to Lorain, at a recent meeting of officers and directors, decided to stop work on the line beyond Cleveland for a time until business warrants its completion. Samuel Rockwell, Cleveland, O., is Chief Engineer of the company.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oklahoma City Industrial Co., Oscar G. Lee, president, Oklahoma City, is raising funds for the construction of a belt line street car line at Oklahoma City.

Track laying on the southern extension of the Missouri, Oklahoma & Gulf R. R. between Durant and the Red River has been started. The laying of tracks on the Texas side of the river to Sherman, Texas, which is to be the southern terminal, will begin as soon as that on the Oklahoma side of the river is completed. The bridge across the river is expected to be completed by June 1.

The Chamber of Commerce of Oklahoma City has given a bonus of $100,000 for the construction of a railroad, the Denver, Kingfisher & Gulf, from Denver to Oklahoma City. It is stated that work will be started within 30 days and that shops and terminals will be located at Oklahoma City.

The City Commissioners of Ardmore have begun condemnation proceedings to secure land on the Washita River, 12 miles from the city, for a site for a municipal power plant. It is estimated that a plant to develop 2,500 HP. can be built for $300,000; and the City Commissioners will call for an issue of bonds for building the plant. J. W. Maxcy Co., Houston, Tex., are the engineers.

Advices from Oklahoma City, Okla., state that plans and specifications have been completed by the City Engineer, for the elevation of railroad tracks entering the city.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of the new additions east of the present end of the Mt. Tabor and Reservoir line at Portland have asked the county to grant them a franchise over the Base Line road for six blocks. They intend to build a street car line for six blocks along the Base Line road to the east and joining with the Mt. Tabor line. Having built it they will make the Portland Railway, Light & Power Co. a present of the six blocks of line.

The Lane County Asset Co. of Eugene has secured a considerable amount of right of way for its projected railway between Eugene and Coos Bay, via Florence. As previously noted, preliminary surveys are already under way. F. B. Kidder and S. P. Ness, Eugene, are interested.

The Coos Bay & Oregon Central R. R. Co. has filed its articles of incorporation at Salem. The company has a capital stock of $4,000,000. The purpose of the organization, as set forth in the articles, is to build a rail line between Coos Bay and Boise, Idaho. C. F. Hendrickson, Sam Connell and J. H. Cole, all of Portland are the incorporators. The company is stated to have already made a survey from Coos Bay to Roseburg, and is also said to have preliminary surveys under way up into the Cascade mountain range. Engineer F. A. Haines, Marshfield, Ore., is in charge of the preliminary work, and the new company is said to have taken over the rights and interests possessed by the Coos Bay, Oregon & Idaho Ry., which has been busy for the past year between Roseburg and Marshfield.

The City Council of Albany has granted the Oregon Electric Ry. a franchise for the use of 5th St. in that city its entire length and the use of Baker St., from 4th to 6th, one block on each side of the 5th St. line. The road agreed to begin work at once and furnished a $10,000 bond to have the extension of the road from Salem to Albany in operation within two years.

The Jordan Valley R. R. Co., of Scio, Ore., has been incorporated with a capital stock of $50,000, and proposes a line from Munkers, in Linn County, east to Scio, thence easterly by the most practicable route to the Jordan Valley; and from Scio southerly to Lacomb. A. G. Prill, E. C. Peery and Charles Wesley are the incorporators.

The City Council of McMinnville has granted a 25-year franchise to the Oregon Electric Railroad Co. to construct lines entering the city along B St., also on Lincoln St., for switching purposes. A bond was filed by the company for $10,000, to have the road completed and in operation within two years.

Resident Engineer H. E. Beard, of the Oregon Trunk Line is in Madras, Ore., preparatory to starting construction of the line south of that city through Bend.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Final surveys have been started for the projected electric railway of the Pittsburg, Butler, Slippery Rock & Northern Ry. Co. The line crosses the Western Allegheny near Isle, 12 miles west of Butler. The project is a part of a through line between Butler and Conneaut Lake, and it is understood will connect with the Pittsburg and Butler line. J. H. Barrett, Pittsburg, Pa., is the engineer.

The Easton & Washington Traction Co. and the Northampton Traction Co. are to pass under one management at an early date. The former line extends from Phillipsburg, N. J., to Port Murray, N. J., a distance of 18 miles, and it contemplates pushing east to obtain connections across the state to Jersey City. The Northampton Traction Co. operates lines from Easton, Pa., to Nazareth and to Bangor, with connections to Portland. A 4-mile line is contemplated to Delaware Water Gap from Portland, giving trolley connections from Philadelphia to Stroudsburg. Over $1,000,000 is embraced in these plans.

The Baltimore & Pennsylvania Ry. Co., J. Pierce Bruns, president, 1209 Calvert Bldg., Baltimore, Md., chartered recently, is reported

to be about ready to have work started on the construction of its electric railway from Hanover, Pa., to Reistertown. Of the $600,000 capital stock of the company $60,000 is reported to have been already subscribed. The line will pass Fowlesburg, Arcadia, Hampstead, Greenmount and Manchester, paralleling the Western Maryland to that point. From Manchester the line will be constructed in a direct route toward Hanover, passing Melrose. The contract for constructing the line has been let to the Maryland Construction & Development Co., Baltimore, Md.

The Philadelphia, Bethlehem & New England R. R. Co. has been organized with a capital stock of $250,000 by Charles M. Schwab and associates for the purpose of constructing a railroad 25 miles long from Durham to the steel works at Bethlehem, connecting with the Lehigh & New England R. R. near Nazareth.

The Tarentum, Brackenridge & Freeport Street Railway Co., which was refused a franchise over certain streets in Brackenridge, will use a private right of way which goes around the borough. Tarentum has granted a franchise, and work will commence soon on the construction of the line to Freeport. It will connect with the Allegheny Valley Street Ry. at Tarentum.

The New York Central & Hudson River R. R. has surveys under way for a proposed branch line between Keating and Avis. The engineers are surveying two routes, one of which passes through Lockport and the north side of the river and the other will pass through Lock Haven from north to south; thence east to a point near the Strohecker home in Castanea township. Both the routes have already been gone over and the present corps are again going over the work.

Promoters of the Scranton-Binghamton Trolley Line, it is reported, have submitted a proposition to the city of Montrose asking for right of way in Montrose, Pa., and Bridgewater township, a site for a station in the city and bond subscription of $100,000.

According to reports the Bessemer & Lake Erie R. R. Co. contemplates an expenditure of $1,750,000 this summer for the improvement of its line between Conneaut Harbor and the steel mills in the Pittsburg District.

Officials of the Pittsburg, McKeesport & Westmoreland St. Railway Co. are planning the construction of a line to Donora, Pa., where it will cross the river through Rostraver township, Westmoreland County. A loop will then be built up the river between Donora and Monessen crossing the river by means of a new bridge to be constructed where it will connect with the Monessen and thence over the same route to Westmoreland County seat.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. M. Hyatt, representing the Empire Construction Co., of St. Louis, Mo., has organized a company to build an interurban line from Dallas to Cleburne. As proposed the route is from Dallas west to Eagle Ford, passing near the two cement plants and Gates. Then the road will go directly west to Grand Prairie, thence south to Cleburne.

C. V. Burkhead, representing San Antonio capitalists, James T. Priest and N. A. Dawson of South Austin and Frank M. Maddox have appeared before the commissioners court at Austin, asking for a franchise for a proposed street railway for South Austin. The agreement as reached provides for the annual payment of $1,200 for ten years, and after that period 5 per cent of the gross income of the line, provided it does not fall below $1,200. The San Antonio parties propose to build at least one and a half miles of track within a year after their requirements have been complied with. The line will run up town as far as Sixth street.

Col. I. D. Polk, of Beaumont, has applied to the city council of that city for a franchise for the use of certain streets and alleys in the city of Beaumont and the right to lay track and operate electric cars. He also has applied for franchise for the erection and operation of a plant to furnish light and power. The franchise for the street railway is desired in connection with a plan to build and operate an interurban line from Beaumont to Port Arthur. The new enterprise contemplates the erection of a new light and power business on a large scale and the operation of the interurban cars on an hourly schedule between Beaumont and Port Arthur. It is also stated that the ground on which the big plant is to be constructed has already been secured.

The Atchison, Topeka & Santa Fe Ry. has completed plans for freight offices, warehouses and transfer sheds at Temple, which will call for the expenditure of $60,000. K. S. Hull, Temple, is Division Superintendent.

The Southern Pacific Railway is stated to have a large hydraulic dredge at work on the oyster reef at Sabine Pass, pumping out oyster shell for use in ballasting the tracks of the Sabine & East Texas Railway from Beaumont to Sabine. It is also said that the road is to be further improved by putting down 90-lb. rails for the entire track from Sabine to Beaumont.

It is reported that the Cotton Belt Ry. will extend its line from McGregor to Hamilton instead of from Gatesville and has given up the intention of paralleling the Temple Northwestern railway.

The Eastern Texas Traction Co. is securing right of way from its projected interurban line between Greenville and Wolfe City. Joseph F. Nichols, Levy Bldg., Greenville, Tex., is secretary.

The Houston & Bay Shore Traction Co. mentioned in our last issue, has applied to the County Commissioners at Houston for a franchise from the county to construct an interurban line from Houston to Morgan's Point, through La Porte. The company desires the franchise for a period of 50 years, and agrees to guarantee the county that work will begin on the construction within 60 days after the official action of the court. The company was formed by A. Foster Irwin, of Detroit, Mich.

John C. Whitney, President of the Commercial Club of Carthage, Tex., has a proposition under way to build a railroad from Shreveport, La., to Waco, Tex., over the following route: Shreveport to Carthage, thence to Mount Enterprise, thence to Rusk, thence to Palestine, thence to Fairfield, thence to Mexia and on to Waco.

G. S. Vivian of Chicago, representing financial interests in that city, has been in Temple in conference with the directors of the Commercial club in regard to a proposition to construct an interurban electric line between Temple and Waco.

The contract for bridge work on the Temple Northwestern Railway has been awarded the firm of C. G. Patton of Houston. The piling to be used between Temple and the Leon river will be supplied by W. D. Parish of Temple.

All arrangements have been made for the construction of the proposed Smithville-Aransas Pass Railroad of Texas, excepting definite decision on the towns included along the right-of-way. Engineers will start work upon the survey at once. James H. Collins, 88 LaSalle St., Chicago, Ill., is interested in the project.

The Kansas City, Mexico & Orient Ry. Co. has contracted for nearly 50 miles of right of way for the proposed extension of the line from San Angelo to Allende, Mex., where connection will be made with the National Railways of Mexico. W. W. Colpitts, Kansas City, Mo., is Chief Engineer of the railroad.

Officials of the Texas Central R. R. Co. are to submit a proposition to the city of Abilene, Texas, involving the extension of the Deleon line to that place. Henry K. McHarg, Stamford, Conn., is president and C. Hamilton, Waco, Texas, is Vice President and General Manager.

The Texas Traction Co., J. F. Strickland, President, Dallas, is considering extending its line from Dallas to Waco. The line at present is in operation between Denison and Dallas.

The directors of the Quanah, Acme & Pacific Ry., at a meeting at Quanah, voted to increase the capital stock to $750,000 and to float bonds on 44 miles of road now completed at $30,000 per mile. It was decided to push construction as rapidly as possible to Roswell and El Paso, work to start early in May.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

E. M. Boyer, Springville, has started work on his contract for constructing a long tunnel for the new Bingham & Garfield Ry.

The Sevier River Land & Water Co., promoting the Lynndyl irrigation project and land opening, according to reports from Salt Lake City, has announced its intention to at once start on the high line canals, one to start at a point on the river above Leamington and to extend to Holden, the other on the other side of the original tract, to extend to Aiken. In addition it is proposed to generate power for the town of Lynndyl at the point where the first canal passes the new townsite.

A. W. McCune has completed negotiations and preliminary plans for the construction of the Amazon & Pacific Ry., which proposes a line across Peru in South America. Mr. McCune has received from the government of Peru concessions covering the building of the line. This concession includes 5,000,000 acres of land and approximately $25,000 per mile for the line on the Pacific slope and $65,000 per mile for the other line to the Amazon. The company proposes the construction of a line from Goyllarisquiga to Puca Alpa, Peru, a distance of 220 to 250 miles, according to diffrent surveys. Mr. McCune is now at his home at the head of Main St., Salt Lake City, Utah, where he will remain until June when he will return to Peru to begin work on the road.

The Gunnison Valley Power Co. has been granted a franchise at Ephraim. Orders for the machinery are reported to have been placed. Construction work on the power development is to be started shortly, it is said. O. M. Duggins, Provo, Utah, is Manager.

Reports from Salt Lake City, Utah, state that double track work has been started on the western end of the Lucin cutoff and that about five months will be required for its completion. G. F. McGonagle, Salt Lake City, Utah, is Engineer, Oregon Short Line R. R.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hampshire Southern R. R. now under construction from Romney to Petersburg, W. Va., a distance of 45 miles, has been opened to traffic between Romney and Moorefield, Va. The line will be completed about July 1, it is said.

Stockholders of the Atlantic Northern R. R. Co., at a recent meeting held at Kingwood, W. Va., named the following officers: James W. Flynn, President; William M. Schaeffer, Vice President; E. M. Lantz, Treasurer; W. S. Downs, Secretary; Julius K. Monroe, General Manager. The proposed route of the company is from Rowlesburg up the Cheat River, intersecting the Western Maryland R. R., at Parsons, W. Va.

Organization of the Cheat River & Monongahela Valley R. R. Co., has been perfected, and the following officers named by the stockholders: Neil J. Fortney, President; E. M. Lantz, Vice President and Treasurer; W. S. Downs, Secretary; Julius Monroe, General Manager. The projected line of the company will run from Albrightsville, on the Cheat River, to a point below Point Marion where it will cross the Monongahela from there to some point in Pennsylvania. The headquarters are at Kingwood, W. Va.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work is under way on the Inland Empire Line (C., M. & St. P. Ry.) from Couer d'Alene to Dishman's, six miles east of Spokane. Otto Hansen, 720 Paulsen Bldg., Spokane, has over 70 men and 40 teams at work on his grading contract which

extends from Spokane bridge to Dishmans. The work includes a considerable amount of rock excavation just west of Spokane bridge. Jones & Onserud, Hutton Bldg., Spokane, have the contract for constructing the line from Coeur d'Alene to Spokane Bridge, and will begin work shortly.

A six months extension of time has been granted the Nooksack Valley Traction Co. in which to begin actual construction of the interurban line from Bellingham to Marietta, Ferndale and Lynden.

Construction work on the street railway between Centralia and Chehalis has been started at Centralia, and the contractors in charge of the work have opened headquarters in that city. About 50 men will be employed in the work.

Up to the end of 1909, the Seattle & Lake Washington Waterway Co., which has done all the dredging on the tideflats at Seattle, has excavated from Seattle waterways and used for raising the level of the tidelands above high tide a total of 13,794,906 yds. With that material 802 acres of tidelands have been filled and raised. The following statement shows the total amount of work done by the Seattle & Lake Washington Waterway Co. during each year:

	Cubic yards.	Cost.
1895	216,949	$ 40,790.79
1896	877,978	164,247.01
1897	337,894	62,914.68
1898	.....	.....
1899	.....	.....
1900	102,468	18,985.20
1901	1,605,173	298,298.70
1902	1,761,367	327,466.36
1903	2,198,008	409,196.39
1904	894,288	170,118.87
1905	74,647	13,909.58
1906	1,962,838	365,009.57
1907	3,127,468	573,374.01
1909	5,635,828	1,080,535.59
Total	18,794,906	$3,524,847.04

The Seaboard Engineering & Construction Co., of Seattle, has been incorporated with a capital stock of $1,000,000, the incorporators being Henry S. Noon, Harrison B. Martin and W. G. Beard.

The Occidental Fish Co., Seattle, has had plans prepared for a modern wharf and sheds to be erected at the foot of Bay St., Seattle, by the company. The new dock will be 66x 122 ft. In addition to the dock and shed a 3-story warehouse will be erected.

The Spokane, Portland & Seattle Railroad Co., T. H. Croswell, Chief Engineer, Portland, Ore., purposes to spend $2,000,000 for the building of grain docks, grain elevators, spurs and trackage along the Columbia River adjacent to Vancouver this year. The company has asked certain franchises from the city and county officials and work will be commenced as soon as possible.

Surveys have been started for the proposed Bellingham-Skagit County interurban line, which is to be built for the Stone & Webster Engineering Corporation, of Boston, Mass. S. L. Shuffleton, Sunset Block, Bellingham, is Engineer for Stone & Webster.

The Tacoma Railway & Power Co., of Tacoma, has been petitioned to double track its McKinley Park line.

Acording to an announcement, reported to have been recently made by D. C. Corbin, Spokane, Wash., President of the Spokane International Ry. Co., construction work will be started shortly on the 10-mile branch from Spokane to Coeur D'Alene, Idaho. Materials are said to have been ordered and right of way all secured.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

J. A. Orton & Sons, contractors for the Chicago & Wisconsin Valley R. R. line established a camp near Ketchum's Point, Portage. Orton & Sons have the contract to grade the road from Portage to Briggsville in Marquette county. Work will also be started in Portage and a city loop will be built connecting the Soo Line and Chicago, Milwaukee & St. Paul line. It is hoped to have the line completed between Briggsville and Madison within a year.

Construction work on the Janesville & Madison interurban line is to be started this month according to a statement at Janesville of Joseph Ellis, Engineer, of the Cincinnati Construction Co., which is backing the project.

Fred A. Baxter, Superior, has been awarded the contract for the grading of the Soo Ry. ore line and yards, south of the Superior city limits, and the dock site on St. Louis Bay. Work will commence at once and will be completed by July 1, so that laying of steel may be finished by Aug. 1, when dock is to be ready for shipping ore.

O. Latham, Shawano, Wis., has resumed work on cutting the right of way for the Wisconsin & Northern R. R. extension northwest for Shawano.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Canadian Northern Ry. has recently awarded the following contracts: The Extension of the Oak Point line to the Cowan Construction Co. C. J. Murray has been awarded the extension of the line west from Prince Albert, 30 miles of which have already been constructed. The same contractor has also been awarded the line northwest from Prince Albert. McMillan Bros. have been awarded the construction of the Thunder Hill branch.

The Canadian Government has decided to renew subsidies previously granted for 3,048 miles of railroad. In all 44 subsidies are proposed, and on the basis of $3,200 a mile the total will amount to $8,862,400, but there is small probability that 10 per cent of this amount will ever be called for. Among the subsidies renewed are the following: To the St. Mary's & Western Ontario Ry. Co. for a line of railway from Embro to Exeter, not exceeding 36 miles. To the Manitoulin & North Shore Ry. Co. for three lines of railway, not exceeding in all 194 miles. To the Algoma Central & Hudson's Bay Ry. Co. for three lines not exceeding in all 275 miles. To the Bracebridge & Trading Lake Ry. Co. for a line of railway from Bracebridge, in Muskota, to a point at or near Baysville, Ontario, not exceeding 16 miles. To the Lac Seul, Rat Portage & Keewatin Ry. Co. for a line not exceeding 22 miles. To the Nepigon Ry. Co. for lines not exceeding in all 80 miles. To the Ontario, Northern & Temagami Ry. Co. for a line from a point at or near Sturgeon Falls, in a northwesterly direction, to a point on the westerly shore of Lake Temagami, in the district of Nipissing, not exceeding 50 miles. For a line of railway from Sharbot Lake or Bathurst station, in the Province of Ontario, or between these points, via Lanark village, to Carleton Place, not exceeding 41 miles. To the Erie, London & Tillsonburg Ry. Co. for a line of railway from Port Burwell to London, not exceeding 35 miles To the Toronto, Lindsay & Pembroke Ry. Co. for a line of railway from Golden Lake to Bancroft, not exceeding 51 miles. To the Kingston, Smith's Falls & Ottawa Ry. Co. for a line of railway from Kingston to Ottawa, not exceeding 101 miles. To Pacific, Northern & Omineca Ry. Co. for a line of railway from Edmonton, northwesterly, to or toward Peace River, not exceeding 110 miles. To Southern Central Pacific, Ry. Co. for following lines of railway: (a) from a point two miles west of Pincher station on the Crows Nest Pass branch of the Canadian Pacific railway, northwesterly, not exceeding 10 miles; (b) from a point two miles west of Pincher station on Crows Nest Pass branch of Canadian Pacific railway southwesterly, not exceeding 40 miles. To Kettle River Ry. Co. for the following lines of railway: (a) from Midway to a junction near Merritt with Nicola, Kamloops and Similkameen railway not exceeding 250 miles; (b) from a point on the company's line of railway near Coldwater River to a point on the Fraser River, not exceeding 50 miles. To Kootenay Central Ry. Co. for a line of railway from Golden toward the international boundary line via Windermere and Fort Steele, then crossing the Crows Nest Pass railway at or near Elko, not exceeding 186 miles. To Esquimalt & Nanaimo Ry. Co. for a line of railway from a point on its main line of railway at or near Duncan's to Cowichan Lake, not exceeding 24 miles.

The Northern Navigation Co. is to construct a 600 ft. addition to the New Ontario dock at Sault Ste. Marie, Ont.

A resolution is before the Canadian Parliament providing for a government guarantee of bonds of the Canadian Northern Alberta Ry. Co. for the construction of a line from Edmonton west to the coal areas near the Brazau River and the headwaters of Macleod River, a distance of 150 miles. The guarantee is to the extent of $13,000 per mile for the first 50 miles and $25 per mile for the balance of the line, with interest at the rate of 3½ per cent per annum, payable half-yearly. Usual conditions with regard to security are imposed. The guarantee supersedes a previous guarantee of bonds to the Edmonton, Yukon & Pacific Ry.

J. W. Stewart & Co., Vancouver, B. C., contractors for building the V., V. & E. railway between Princeton and Abbottsford, have awarded to Martin, Welch & Co., a sub-contract for the 20 mile section between Abbotsford and Chilliwack. Construction work has been started from Abbotsford.

Location surveys for the Canadian Northern Ry.'s route between Kamloops and Yellowstone Pass at the summit of the Rockies have been completed and work is now under way revising the location of the company's line on the main Thompson River between Kamloops and Lytton.

The citizens of Moose Jaw, Sask., have voted in favor of a by-law giving a street railway franchise to a company composed of Otttawa capitalists, who will start work at once on putting in a system.

Probably the first contract to be let for the Hudson Bay R. R. will be for the construction of the bridge across the Saskatchewan at The Pas, and this will cost about $250,000. About $350,000 will also be available for grading. As the country north of The Pas is especially favorable for railway construction this sum should be sufficient to carry on the work for a considerable distance out and contracts will probably be let for the first 40 miles, all of which has now been located. At the present time there is available the sum of $680,000 for engineering and construction if the $500,000 included in the government supplementary estimates is passed. Of the total sums available it will need approximately $80,000 for the pressing forward of the engineering and location work, which is now being carried on. Three parties are now in the field. Still other parties will be put out as soon as navigation opens to the upper end of Lake Manitoba.

Fallon Bros., Cornwall, Ont., have been awarded the contract at $70,000 for improvements around Lock 17 of the Cornwall Canal. The improvements consist of 180 ft. of concrete wall along the north bank, followed by 520 ft. of heavy cribwork designed to set the current in the canal more directly towards the lock than at present. Fallon Bros. also have the building of a large new weir just below the locks.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Governor of the State of Zacatecas, Mexico, has granted Gustave Madero, Monterey, Mex., a formal construction concession for the building of the long projected Zacatecas and Orient Railway, a new line which will be built from Camacho station, located 199 kilometers south of Torreon and 232 kilometers north of Zacatecas, on the El Paso-Mexico City line of the National Railways, to the important mining camp of Mazapil, in the extreme northeasern corner of the state of Zacatecas. According to the terms of the concession construction work is to be started June 1.

The Transvaal Copper Co., of Cincinnati, O., is said to have capital available for the construction of a railroad from Cumpas to the company's mines, from 30 to 40 miles west

of that point, for further extensive development and for smelting operations.

According to reports, Harris Walthal, who received a concession from the Mexican Government about a year ago for the construction of a railroad from Durango to the old mining town of San Dimas, in the Sierra Madras, has succeeded in organizing a strong British company to carry out the terms of the concession. The line as proposed will be about 125 miles in length.

The Trenton Street Ry. Co. of Trenton, N. J., has opened bids covering the proposed introduction of 14,450 ft. of new rails in Trenton and the restoration of pavements along the route. It is estimated that the improvement will cost upwards of $100,000.

The recent visit to Anderson, S. C., of the owners of the Anderson Traction Co., has given rise to the report that the road was to be extended. T. B. Lot is Engineer.

The Public Service Corporation, Newark, N. J., which recently obtained possession of the Camden & Trenton Traction Co.'s line, will, it is reported, erect one of its power plants in Burlington, N. J. The corporation, it is also reported, is endeavoring to purchase the franchise of the Burlington electric light and power plant, thus practically completing its control of the lighting facilities of the city.

R. E. Cowden has completed preliminary surveys for a railroad from the properties of the Nevada United Mines Co. of Denver, at Wardner to connect with the Nevada Northern Ry. According to the present plans the road will be 14 miles long, and an average grade of 1 per cent has been obtained for practically the entire distance. The worst stretch of road will have a 3 per cent grade for half a mile. Mr. Cowden is chief engineer for the Mayo River Power & Light Co. in Mexico, which is controlled by the directors of the Nevada United Mines Co.

The Vicksburg, Shreveport & Pacific Ry. (Queen & Crescent) is reported to have acquired control of the Louisiana & Northwestern, running from McNeil, Ark., to Natchitoches, La., and crossing the Vicksburg, Shreveport & Pacific at Arcadia, La. It is also stated the Louisiana & Arkansas has bought the embankment and right of way of the old Klingman road from Minden to Homer, La., and will extend its line to that point. W. H. Vance, Stamps, Ark., is engineer, Louisiana & Arkansas Ry.

The Orleans Levee Board, Sidney F. Lewis, Engineer, New Orleans, La., has voted that the levee grade from Lafayette to Louisa St. be changed from 25 to 23 ft. This will mean a saving of about $1,000,000 to the Levee Board in the purchase price of properties.

The street railway company at Phoenix, Ariz., Kenneth Shibley, engineer, has begun preliminary work on its Mesa St. car line in order to comply with franchise requirements. The line when completed will be about seven miles long.

J. H. Nesbitt has been awarded the contract for the erection of a $26,000 power house for the Norfolk & Western Ry., in Roanoke, Va.

Reports from Armour, S. Dak., state that engineers have headquarters there and are making surveys for the construction of the proposed line of the Sioux Falls, Bridgewater & Wheeler R. R. The company is supposed to be subsidiary to the Rock Island system.

The Nolachcky Power Co. has been organized and proposes to build a dam at the Devils Looking Glass on the Nolachcky River, one mile from Erwin, Tenn.

Surveys are to be made, it is reported, at the instance of L. E. Johnson, Roanoke, Va., President of the Norfolk & Western Ry. for an electric railway between Welch, W. Va., and Bluefield, W. Va.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Brooks, Minn.—Until 9 a. m., May 7, by Town Board of Poplar River, at the office of A. Laniel, Brooks, Minn., for the construction and material of a 22-ft. girder bridge on steel pile foundation with reinforced concrete backing.

Shakopee, Minn.—Embankment.—Until 8 p. m., May 10, by Common Council, for the necessary labor and materials for the construction of an embankment across the washout in the bank of the Minnesota River, west of the north end of the bridge crossing said river in Shakopee, Minn. Alex Schaefer is City Recorder.

Taylor Falls, Minn.—Until 1 p. m., June 3, by Village Council, Taylor Falls, Minn., for the construction of a steel arch or reinforced concrete bridge across the St. Croix River, between the villages of St. Croix Falls and Taylor Falls, Minn.

Taylors Falls, Minn.—Until 1 p. m., June 3, by the Commissioners of the Interstate Park, for the construction of a steel arch or reinforced concrete arch bridge over the St. Croix River, between St. Croix Falls, Wis., and Taylors Falls, L. P. Wolff, Consulting Engineer, 204 Essex Bldg., St. Paul, Minn. Official advertisement will be found elsewhere in this issue.

Nevada, Mo.—Until 2 p. m., May 17, by James M. Clack, County Highway Engineer, for the construction of a steel bridge across the Marmaton at the Cogswell Ford in Section 34, Lake Township; one across the Big Drywood at Brook Ford on the south side of Section 16, Harrison Township; a steel bridge across the Little Drywood at Henson Ford on the south side of Section 31, Center Township; a steel bridge across the Green River in Section 25, Lake Township.

McCook, Neb.—Until noon, June 1, by County Clerk, for the construction of a wooden bridge across the Republican River on the county line.

Jamestown, N. Y.—Until noon, May 14, by Board of Estimate and Review, for the construction of two reinforced concrete bridges, one a girder bridge at Winsor St., and the other a double arch bridge at Fairmont Ave.

Cincinnati, O.—Until noon, May 27, by Board of County Commissioners, for the construction of a box culvert and retaining wall on Bogart Road near Albert Bogart's place in Anderson Township. Fred Dreihs is Clerk.

Cincinnati, O.—Until noon, May 20, by Board of County Commissioners, for the construction of culverts and changing course of creek on West Fork Road, between Schoolhouse and Rehkamp in Millcreek Township.

Cleveland, O.—Until 11 a. m., May 25, by County Commissioners, for the construction of bridge work per Report No. 2614, concrete arch on Union St., Bedford, over Tinker's Creek, Bedford Township.

Lima, O.—Until noon, May 10, by County Commissioners, for the erection and completion of a steel or concrete bridge across the Hog Creek on the line between Allen and Hardin Counties. C. R. Phillips is Clerk of the Board.

Van Wert, O.—Until noon, May 25, by Joint Board of County Commissioners of Allen and Van Wert Counties, for the necessary labor and material for the construction of a bridge across the canal on county line between said counties and at the Ludwig Road crossing. C. R. Phillips is Clerk of the Allen County Board.

Warren, O.—Until May 23, by County Commissioners for the construction of a bridge over Yankee Run on East Liberty St., in the village of Hubbard.

Lancaster, Pa.—Until 10 a. m., May 6, by County Commissioners, for the construction of a concrete or steel county bridge over the Conestoga Creek at Rupp's Mill in West Earl Township, Lancaster County, Pa. Frank Eshleman is County Controller.

New Castle, Pa.—Until noon, May 12, by Board of County Commissioners, for the necessary labor and material for the construction of five bridges in Lawrence County. S. E. Crawford is Clerk.

Norristown, Pa.—Until 11 a. m., May 4, by County Commissioners, for the paving with creosoted wooden block the approach to the West Airy St. bridge. Robert C. Miller is Clerk.

Cameron, Tex.—Until May 18, by Commissioners' Court, for the construction of a steel bridge at San Gabriel Crossing, San Gabriel River in the village of San Gabriel.

Cheyenne, Wyo.—Until 10 a. m., May 5, by Board of County Commissioners, C. Edward Artist, County Clerk, for the construction of a wood and steel bridge over the North Platte River. The structure will be 1,300 ft. long and 12 ft. wide.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Mason, San Francisco, Cal.—Until 11 a. m., May 17, by Constructing Quartermaster, Fort Mason, San Francisco, Cal., for the construction, installation of plumbing, heating and electric wiring in two single barracks at Fort Winfield Scott, Cal.

Fort Dupont, Delaware City, Del.—Until 11 a. m., May 16, by Constructing Quartermaster, Fort Dupont, Delaware City, Del., for furnishing and installing metal frame window screens in five new buildings at Fort Dupont, Del.

Wilmington, Del.—Until May 14, by Engineer Fourth Light House District, Wilmington, Del., for the erection of a dwelling at Liston's range rear light station, Del.

Wilmington, Del.—Until May 10, by Engineer Fourth Light House District, Wilmington, Del., for removing the superstructure of the Gross ledge light station, Delaware Bay.

Dayton, Ia.—Until 9 a. m., May 20, by Rev. N. E. Kron, for the erection and completion of the Swedish Lutheran Church, material brick, at Dayton, Ia.

Harlan, Ia.—Until May 14th, by Brown Bros., Security Savings Bank Bldg., Cedar Rapids, Ia., Architects, for the steam heating, plumbing and electric wiring complete for the main building of the Interstate Associated Colleges, Harlan, Ia.

Osage, Ia.—Until noon, May 19, by O. A. Houghland, Architect, Chariton, Ia., for the construction of a public library building, including all necessary labor and material. O. L. Cole is President.

Fort Leavenworth, Kan.—Until 11 a. m., May 24, by Capt. William D. Davis, Constructing Quartermaster, for the construction, plumbing, heating, wiring and fixtures of following buildings: Two sets field officers' quarters, two double sets company officers' quarters, three 4-set officers' quarters.

Springfield, Mass.—Until May 12, by Municipal Building Commission, for Contract No. 3, heating and ventilation, and Contract No. 5, plumbing for the auditorium, tower and passage and municipal office building of the new municipal buildings in this city.

Portland, Me.—Until 10 a. m., May 18, by Capt. C. F. Humphrey, Jr., Constructing Quartermaster, Portland, Me., for construction of a cable storehouse, plan 251-A, and an ordnance shop, plan 189-B, including plumbing in the latter building at Fort Preble, Me.

Carrollton, Mo.—Until 3 p. m., June 2, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Carrollton, Mo.

Ellendale, N. D.—Until 1:30 p. m., May 20, by W. M. Kern, Ellendale, for the erection, including material and labor for the 6-room school building except heating and plumbing.

Fargo, N. D.—Until 1 p. m., May 10, by Board of Trustees, for the erection of a fireproof chemistry building, located at the Agricultural College grounds, Fargo.

Fort H. G. Wright, N. Y.—Until 10 a. m., May 20, by Capt. F. T. Arnold, Constructing Q. M., New London, Conn., for furnishing and installing screens and metal weather strips on ten buildings at Fort H. G. Wright, and on ten buildings at Fort Terry, N. Y. Official advertisement will be found elsewhere in this issue.

Fort Porter, N. Y.—Until 11 a. m., May 20, by Constructing Quartermaster, for addition to guard house at Fort Porter, N. Y.

New York, N. Y.—Until 10 a. m., May 10, by Board of Health, 55th St., Borough of Manhattan, New York, N. Y., for furnishing all the labor and materials necessary or required to erect exclusive of foundations two open-air pavilions, together with all work incidental thereto, upon the grounds of the Riverside Hospital at North Brother Ave., Bronx, New York City.

New York, N. Y.—Until 11 a. m., May 14, by Commissioners of Board of Water Supply, John A. Bensel, President, 165 Broadway, New York, for the construction of four field office buildings and five horse sheds, in the Croton, White Plains and Hill View Division of the Catskill Aqueduct, in the towns of Mount Pleasant and Greensburg and the city of Yonkers, Westchester County, N. Y.

Columbus Barracks, O.—Until 10 a. m., May 25, by Capt. H. J. Hirsch, Constructing Quartermaster, for the construction and erection of a garbage crematory at this post.

Van Couver Barracks, Wash.—Until 11 a. m., May 20, by Capt. Clyfard Game, Constructing Quartermaster, for the construction of a frame storehouse, with slate roof, 240 ft. long, at this post.

Elkins, W. Va.—Until 3 p. m., May 9, by County Court, for the erection of a jail building and jailor's residence for Randolph County.

Fort Myer, Va.—Until 11 a. m., May 11, by Capt. Warren W. Whiteside, Constructing Quartermaster, for the addition to the present administration building at Fort Myer, Va.

Fort Monroe, Va.—Until 10 a. m., May 27, by Capt. Ernest R. Tilton, Constructing Quartermaster, for the construction, including plumbing, heating, electric wiring and fixtures of nine double sets of noncommissioned officers' quarters, at Fort Monroe, Va.

Columbus, Wis.—Until 9 a. m., May 16, by G. S. Lashier, Chairman County Building Committee, Fall River, Wis., for the construction, including labor and material, of a solid brick and stone school building.

Winnipeg, Man.—Until 11 a. m., May 11, by Chairman Board of Control, for necessary labor and material for the construction of two fire stations and drill tower.

Winnipeg, Man.—Until 11 a. m., May 5, by Board of Control, for the construction of an additional floor to the crematory. M. Peterson is secretary.

Port Arthur, Ont.—Until 4 p. m., May 15, by Father J. A. Grenier, parish priest, for the construction of a Roman Catholic church. C. Emile Tanguay is Architect.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Stockton, Cal.—Until 10 a. m., May 14, by Board of Supervisors, for paving certain roads, viz.: Cherokee, Lane, Waterloo, Linden Copperopolis, Farmington, Mariposa, French Camp and West Side Roads, in San Joaquin County.

Bridgeport, Conn.—Until May 6, by city clerk, for furnishing and laying of pavement of Stratford Ave. Brick and wood blocks will be used, but the wood will be used as much as possible, the brick to be placed on steep grades.

Coeur D'Alene, Idaho.—Until 4 p. m., May 16, by city clerk, for improvement of streets, including grading, curbing with concrete, parking streets in Local Improvement Districts Nos. 7, 8, 9, 10 and 11.

Jacksonville, Ill.—Until 10 a. m., May 17, by Board of Local Improvements, for the construction of pavement on West College St. The work includes 5,444 lin. ft. of curb and gutter, 7,780 sq. yds. paving and 2,899 cu. yds. excavation. The cost of the work is estimated at $19,846.

Vincennes, Ind.—Until May 10, by Board of Public Works, for grading and graveling and curbing 11th St. and Fair Ground Ave.

Wabash, Ind.—Until 1 p. m., May 27, by Commissioners of Wabash, Whitley and Huntington Counties, at Wabash, Ind., for the construction of a gravel road on boundary line between Wabash, Whitley and Huntington Counties. J. P. Noftzger is auditor of Wabash County.

Denton, Md.—Until noon, May 10, by County Commissioners, for the improvement of Public Highway in Federalsburg, known as Bridge St. The work includes about ½ mile of road. J. L. Dukes is clerk of the County Commissioners.

Aurora, Neb.—Until noon, May 7, by Board of County Commissioners, for the improvement of a number of county roads leading into this city. D. H. Saylor is County Clerk.

Washington, N. C.—Until 7 p. m., May 12, by Board of Improvements, for the improvement of East Main and East 2d Sts., between Harvey and Market Sts.; West Main St., between Gladden and Bridge Sts.; West 2d St., between Market and Van Orden Sts.; Market St., between Main and 4th Sts, and Water St., between Market and Union Alley; approximately 6,130 lin. ft. Improvements to include grading, curbs, gutters, bituminous macadam or brick pavement, catch basins and cement sidewalks.

Winston Salem, N. C.—Until 10 a. m., May 10, by Board of County Commissioners, for the construction of a macadam road 4 miles in length. A certified check for $1,000 must be filed with each bid.

Elizabeth, N. J.—Until 2:30 p. m., May 18, by County Board of Chosen Free Holders, for the construction of a stone road in Raritan Road and Lake Ave., extending from Terrill Road to Palisade Ave., in Fanwood and Clark Townships. The work includes 32,374 cu. yds. excavation and 23,800 sq. yds. of macadam. F. J. Hubbard is County Engineer, 201 Park Ave., Plainfield, N. J.

Albany, N. Y.—Until 1 p. m., May 6, by Commission of Highways, Albany, N. Y., for the improvement of the Goldens Bridge-Turk's Hill Road No. 770, a length of 3.85 miles in the town of Lewisboro, Westchester County, New York. S. Percy Hooker is Chairman of the Commission.

Brooklyn, N. Y.—Until 11 a. m., May 11, by Alfred E. Steels, Borough President, for regulating and grading and curbing and laying sidewalks on portions of Avenue C, Dorchester Road, Fifth Ave., Fifty-fifth St., Hegeman Ave., Huron St., Sherman St., Sterling Pl., Seventh Ave., Seventy-second St., and Sutter Ave.

Brooklyn, N. Y.—Until 3 p. m., May 12, by Commissioners of Parks, Arsenal Bldg., Manhattan, N. Y., for repairing asphalt pavement on a concrete foundation in the roadway of Glenmore Ave., Eastern Parkway extension Stone Avenue and repairing asphalt block pavement on Bushwick Ave., between Eastern Parkway extension and Jamaica Ave., together with all the work incidental thereto.

Cincinnati, O.—Until noon, May 6, by Director of Public Service, for furnishing the necessary labor and material for the paving of Beechwood Ave., from Cinnamon St. to Cohoon St., with brick. The work includes grading, setting limestone curbs and constructing the necessary drains and inlets.

Cincinnati, O.—Until noon, May 20, by Board of County Commissioners, for the oiling of Blue Rock Pike, from Colerain Pike to the River Road, in Colerain Township.

Hamilton, O.—Until noon, May 24, by Board of County Commissioners for the reconstruction and repair of the public roads known as the Lebanon and Oxford Turnpike, from the Trenton Bridge over the Miami River eastwardly and the Middletown & Hamilton pike from its intersection with said road and by the construction and erection of embankments and levees to protect same. J. E. Brate is county auditor.

Houston, Tex.—Until noon, May 13, by John B. Ashe, county auditor, for paving 4 miles of the Lynchburg-Crosby Road; the remainder of the Seabrook Road.

Arlington, Va.—Until 11 a. m., May 10 by Capt. H. L. Pettus, Depot Quartermaster, Washington, D. C., for Tarvia on roadway in Arlington, Va., National Cemetery.

Olympia, Wash.—Until May 10, by State Highway Commissioner, for grading, bridging and graveling of state road No. 15, known as the Lewis River Road, extending from Woodland several miles toward Mount St. Helens.

Elgin, Que.—Until May 10, by Andrew Coffey, Mayor, for the construction of about 8 miles of macadamized road in the aforesaid municipality. Work must be done with modern crusher, sprinkled and rolled and completed before November 1.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Little Rock, Ark.—Until noon, May 16, by City Secretary M. A. Metzger, for the construction of 3½ miles of sanitary sewers, and a septic tank for the city. The work is estimated to cost $18,000. Lund & Hill, Little Rock, Ark., are the consulting engineers.

Searcy, Ark.—Until 3 p. m., May 25, by J. F. Headlee, Secretary, Board Public Improvements, for furnishing materials and constructing a system of sanitary sewers. W. S. Shields Engineering Co., Engineers, 1201 Hartford Bldg., Chicago, Ill. Official advertisement will be found elsewhere in this issue.

St. Petersburg, Fla.—Until 8 p. m., May 5, by W. F. Divine, City Clerk, for the construction of a sewer system as follows: No. 9, 234 ft. of 6-in. pipe; No. 10, 720 ft. 6-in. pipe; No. 11, 280 ft. of 10-in. pipe and 1,250 ft. of 6-in. pipe; No. 12, 6,862 ft. of 6-in. pipe and 2,750 ft. of 8-in. pipe and 1,325 ft. of iron pipe 8 ins.

Baltimore, Md.—Until 11 a. m., May 11, by Board of Awards for the necessary material and labor for the erection and installation of electrical and mechanical equipment for the sewage disposal works at the Back River. The work includes the following approximate quantities: 2 150 H. P. Hydraulic Turbines, with governors, complete; 2 110 K. V. A. Alternating Current Generators and Exciters, complete; 1 50 H. P. Alternating Current Motor; 4 35 H. P. Alternating Current Motors; 1 5 H. P. Alternating Current Motor; 1 Two-Stage Centrifugal Pump; 4 10-in. Single-Stage Centrifugal Pumps; 1 5 K. W. Motor-Generator; 1 75 H. P. Oil Engine; 3 37½ K. V. A. Transformers; 5 25 K. V. A. Transformers; 1 15 K. V. A. Transformers; 1 5 Panel Switchboard in Powerhouse; 1 Arc Lamp Regulator, complete; 15 Alternating Current Arc Lamps; 1 Traveling Crane, complete; Tile and Metal Conduits; exterior and interior wiring; lighting fixtures; cast and wrought iron pipe and fittings.

Missouri Valley, Mo.—Until 7:30 p. m., May 4, by T. M. Gilmore, city clerk, for the installation of a sewer system as follows: 4,704 lin. ft. of 18-in., 390 lin. ft. of 15-in. 2,770 lin. ft. of 12-in., 7,774 lin. ft. of 10-in., 16,534 lin. ft. 8-in. 26 flush tanks, 64 manholes, 200 ft. 12-in. and 84 ft. 18-in. cast iron pipe; concrete bulkhead. Iowa Engineering Co., Clinton, Ia., are the engineers for the work.

St. Louis, Mo.—Until Noon, May 31, by Board of Public Improvements, for the construction of South Harlem Joint District Sewer—Section Section, in South Harlem Joint Sewer District, under the authority of Ordinance No. 25034, embracing sewers of the following sizes and lengths, to-wit: A sewer of reinforced concrete, 14 ft. wide by 11 ft. 2¾ ins. high (inside measurements), 2,919.55 ft. in length; a sewer of reinforced concrete, 12 ft. wide by 9 ft. 7¼ ins. high (inside measurements), 4,031.25 ft. in length; a branch sewer of brick, 7 ft. 6 ins. in diameter (inside measurements), 1,041.53 ft. in length; a branch sewer of brick 7 ft. in diameter (inside measurements), 100 ft., more or less, in length; with junctions, manholes and all other necessary appurtenances. Deposit required, $5,529.00.

Sanford, N. C.—Until 8 p. m., May 17, by J. D. Gunter, Sr., Town Clerk, for constructing sewer system to include 7 miles of 8-in. to 20-in. pipe sewers and concrete settling tank. Gilbert C. White, Engineer, Durham, N. C. Official advertisement will be found elsewhere in this issue.

Sanford, N. C.—Until 8 p. m., May 17, by Mayor and Board of Aldermen, for the construction of sewer system. The work includes about 7 miles of pipe sewers from 8 to 20 in. in diameter, with appurtenances and concrete settling basin. J. D. Gunter, Sr., is clerk. Gilbert C. White, Durham, N. C., is engineer.

Binghamton, N. Y.—Until May 11, by City Clerk, for the construction of a sewer on James St.

York, Pa.—Until 4 p. m., May 9, by Board of Public Works, for the construction of 3,498 ft. of sewer pipe on East Market St., from Sherman and Edgar Sts.

Winnipeg, Man.—Building—Peter Lyall & Sons, at $300,000, for the interior finishing and the three office floors of the entire building of the union C. N. R. and G. T. P. depot. The total cost of the building will be about $1,300,000.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Birmingham, Ala.—According to reports from this place the officials of the St. Louis & San Francisco R. R. are considering the construction of a large bridge at 12th Ave.

Stockton, Cal.—Surveyors of this county and San Joaquin County are taking up the matter of constructing a joint bridge over the river near Escalon. F. E. Quail is County Surveyor.

Washington, D. C.—Board has adopted the recommendation of the committee on bridges including the replacement of the Rock Creek bridge at Calvert St.; new bridge across Klingle ford on Connecticut Ave.; construction of a viaduct or subway at the inter-section of Cedar St. and the tracks of the Baltimore & Ohio R. R.; for the construction of a bridge across Rock Creek at Q St.

Macon, Ga.—City Council has requested the Central of Georgia R. R. to erect a new bridge on Second St. It is expected that a concrete structure will be installed.

Metropolis, Ill.—Officials of the Paducah & Illinois Ry. Co. are soon to make an application to the United States for permission to construct a bridge over the Ohio River at or near this city 12 miles below Paducah. The structure as proposed will accommodate double track service and is estimated to cost $3,000,000.

Streator, Ill.—City Clerk John D. Patterson sold bonds May 2 in the sum of $40,000 for the construction of a bridge.

Sycamore, Ill.—A survey is being made by W. M. Hay for a new road which it is proposed to open from the House farm north of Cortland village running westerly to a point near the piano factory in De Kalb and connecting with Pleasant St. in that city.

Huntington, Ind.—Allen and Huntington County Commissioners are taking up the matter of constructing two bridges across creeks on the county line.

Alma, Kan.—Plans and specifications have been completed for the construction of seven new county bridges, five of which will be concrete structures.

Louisville, Ky.—Consulting Engineers J. M. Johnson and G. E. Greiner are preparing plans for the construction of the proposed bridge of the Kentucky & Indiana Bridge and Railroad Company over the Ohio River between this city and New Albany, Ind.

Northfield, Mass.—At a town meeting an appropriation of $1,500 was made for repairing the bridge to Mt. Hermon.

Saginaw, Mich.—Committee of the Board of Trade is taking up the matter of constructing a viaduct in the First Ward over the Pere Marquette R. R. tracks and those of the Saginaw Valley Traction Co.

Duluth, Minn.—Estimates are now being prepared by County Highway Commissioner of the cost of filling in the old Tower Ave. bridge and rebuilding it across the river. The present structure is 2,000 ft. in length, consisting mostly of piles on the Tower Ave. side. The new span over the river will probably be of steel.

Kansas City, Mo.—The Atchison, Topeka & Santa Fe Ry. Co. is to construct a new bridge across the river at this place.

Sibley, Mo.—According to announcement reported to have been made by officials of the Atchison, Topeka & Santa Fe Ry. that company will construct a new bridge over the river at this place.

St. Joseph, Mo.—It is expected that the City Council will soon take up the matter of constructing viaducts over the railroad tracks at Sixth, Monterey, 8th, Sycamore, 11th and Atchison Sts.

Fulton, N. Y.—Reports are to the effect that Joseph Connors, Mayor, is considering the feasibility of constructing a bridge at Broadway to cost between $70,000 and $80,000.

Glenville, N. Y.—The construction of the new barge canal will necessitate the raising of two bridges over the Mohawk River, known as the Scotia and Alpaus bridges. The Scotia bridge will cost the town about $30,000 and the railway about $35,000. The work on the Alpaus bridge will cost the railway company about $25,000.

Herkimer, N. Y.—County Engineer has reported it necessary to construct a new bridge over East Creek between the towns of Manheim and St. Johnsville. The estimated cost of the structure is $22,800.

Hudson, N. Y.—Work is soon to be started on the construction of the new steel bridge on the road between this city and Clayerack.

Massena, N. Y.—An election has been carried to bond the town for the construction of a $40,000 bridge across the Grasse River at Massena Center. The structure will be of suspension type with concrete piers and anchorages.

Drayton, N. Dak.—According to advices from this place a new steel bridge will be built across the Red River this summer.

Cleveland, O.—The High Level Bridge Commission is considering the sites adaptable for the construction of the proposed structure and it is believed that Huron Road, S. E., and Lorain Ave., will be the terminals named in the next ordinance to be filed by Alderman Schwarzer.

Covington, O.—The Louisville & Nashville R. R. Co. is seeking right of way for the construction of a new bridge across the Licking river at 11th and Byrd Sts. in this city. The structure as proposed will be of lift type and will cost, it is estimated, $45,000.

Huron, O.—Plans for the construction of the proposed new bridge to be built over the Huron River at this place have been received.

Lancaster, O.—County Commissioners and City Director of Public Service are taking up the matter of constructing a new bridge on the extension of 6th St. over the Fetter's Run.

Warren, O.—County Commissioners have decided upon the construction of a bridge over Mosquito Creek and mill race on Park Ave., in the city of Niles. Fred T. Stone is Auditor of Trumbull County.

Scranton, Pa.—Plans and estimates have been filed with Director of Public Works by E. L. Walters, Supt., Bureau of Building Inspection, for the construction of the proposed $3,000 viaduct at Market Place.

Houston, Texas.—Plans are to be prepared for the construction of a viaduct over the Bayou and railroad yards at Main St. It is said the structure will either be all steel or reinforced concrete.

Bellingham, Wash.—County Commissioners have had plans prepared for the construction of a bridge over the Nooksack River at Nugents crossing on the Deming Road. The structure will have a 240-ft. span and an approach 800 ft. in length.

Colfax, Wash.—County Commissioners are considering plans for the construction of a bridge across the South Palouse River in this city. It is expected that bids for the work will be asked shortly.

Conconully, Wash.—Commissioners of this county have been considering the construction of five bridges located as follows: One at Nighthawk across the Smilkameen; one at Winthrop over the Methow; three over the Okanogan at Tonasket, Omak and Malott.

Delmar, Wis.—Town Board has decided to install two cement bridges one at Otter Creek on the Franklin St. road and the other at the foot of Sherman Hill between Boyd and Cadott. Plans for the structures have already been made by State Engineers.

Basin, Wyo.—County Commissioners have ordered the County Clerk to notify the Reclamation Service to remove the bridge at Marquette in order to make possible the construction of a new bridge at that site.

Roads and Streets.

Items Arranged Alphabetically by States.

Los Angeles, Cal.—Highway Commission is discussing plans, now under way, for the improvement of the San Fernando road, Newhall Pass and Fremont Pass. The Commission has completed specifications for the Los Angeles-Inglewood-Redondo highway.

Sisson, Cal.—Board of Supervisors of Siskiyou County will build a road to the snow line on Mount Shasta from this city.

Aurora, Ill.—North Ave. is to be paved with asphalt from Broadway to Jackson St., at an estimated cost of $20,536, also State St., from Benton to Claim St., at an estimated cost of $17,361.

PROPOSALS FOR PUBLIC BUILDINGS.

War Department, Office of the Constructing Quartermaster, New London, Conn., April 13, 1910. Sealed proposals for the construction, plumbing, heating, electric wiring and fixtures of one guardhouse and one quartermaster's storehouse at Fort Terry, N. Y., will be received here until 10 a. m., May 13, 1910, and then opened. Deposit of $5 required for each set of plans. Information furnished on application. Envelopes containing proposals should be indorsed "Proposals for Public Buildings," and addressed CAPT. F. T. ARNOLD, Constructing Quartermaster, New London, Conn.

DRAINAGE DITCHES.

Angleton, Texas.

Sealed proposals will be received by the Board of Commissioners of Brazoria County Drainage District No. 3, of Brazoria County, Texas, at the office of the County Judge of Brazoria County, at Angleton, Texas, until noon of the 10th day of May, 1910, for the performing of the following work, of which the following is an approximate estimate of the work to be done:

Ditch No. 1	497,394 cu. yds.
Ditch No. 2	31,241 cu. yds.
Ditch No. 3	20,788 cu. yds.
Ditch No. 4	26,300 cu. yds.
Ditch No. 5	35,228 cu. yds.
Ditch No. 6	51,093 cu. yds.
Ditch No. 7	104,327 cu. yds.
Ditch No. 8	11,850 cu. yds.
Ditch No. 9	17,001 cu. yds.
Ditch No. 10	38,142 cu. yds.
Cut-offs on slough	26.660 cu. yds.

Seven miles of slough to be cleared.
Wet excavation.....122.000 cu. yds.

The above is the engineer's approximate estimate. Plans and specifications may be seen at the office of A. R. Leckie, engineer in charge, at Bay City, Texas; also at the office of T. W. Carlton at Alvin, Texas; also at the office of the County Judge of Brazoria County at Angleton, Texas.

Bids will be received for the whole work complete or for any division thereof; each bid shall be accompanied by a certified check for at least 5 per cent of the total amount bid, which shall be forfeited to the Drainage District in case the bidder refuses to enter into a proper contract if his bid is accepted. All bids shall be in writing and sealed and delivered to the chairman of the Drainage Commissioners.

After opening the bids the certified checks will be returned to the unsuccessful bidders. The right is reserved to reject any and all bids.

F. M. RAGLAND, Chairman.
T. W. CARLTON, Secretary.
S. K. MEBANE.
Board of Drainage Commissioners.
A. R. LECKIE,
Engineer in Charge.

STEEL WHARF SHEDS.

New Orleans, La., April 20, 1910.

Sealed proposals will be received by the Board of Commissioners of the port of New Orleans, at their office, Nos. 601-602 Hibernia Bank & Trust Co. Building, until Friday, May 20, 1910, at 1:30 o'clock p. m., for the fabrication and erection of the structural steel and cast iron for any or all of the following sheds:

Eighth-Harmony street shed No. 2.
Sixth street shed.
Third street shed.
Soraparu street shed.
Branch M. King shed.

Deposit, One thousand dollars ($1,000.00) cash or certified check.

Payment: Eighty per cent (80%) monthly.

Bond: In full amount of contract.

Plans, specifications, proposal forms, etc., prepared by J. F. Coleman & Co., Engineers, are on file at the office of the Engineer, A. C. Bell, No. 606 Hibernia Bank & Trust Co. building, New Orleans, La., by whom full sets will be furnished on deposit of twenty-five ($25.00) dollars, the said deposit will be returned upon the safe return of said set in good order.

The right is reserved to reject any or all bids.

HUGH McCLOSKEY.
President.

BRIDGE.

Taylors Falls, Minn.

Sealed proposals for the construction of a steel arch or reinforced concrete arch bridge across the St. Croix River between the Villages of St. Croix Falls, Wis., and Taylors Falls, Minn., will be received jointly by the undersigned at the Village Council rooms in the Village of Taylors Falls, Minn., until one o'clock p. m., on the third day of June, 1910.

Bids may be made for the construction of said bridge in accordance with the Engineer's plans and specifications, copies of which are now on file and can be seen at the offices of the Village Recorder of the Village of Taylors Falls, Minn,. the Village Clerk of St. Croix Falls, Wis., and of L. P. Wolff, Consulting Engineer, 204 Essex Bldg., St. Paul, Minn. Bids may also be made upon plans prepared by the bidders, subject to the conditions set forth in the said specifications.

All proposals must be made on blank forms furnished for that purpose by the Engineer and each proposal must be accompanied by a certified check for a sum equal to ten per cent (10%) of the amount of the bid and made payable unconditionally to the order of the Village Treasurers of the Villages of St. Croix Falls, Wis., and Taylors Falls, Minn., as a guarantee of good faith.

The right is reserved to reject any or all bids.

COMMISSIONERS of the Interstate Park of the Dalles of the St. Croix for Wisconsin and Minnesota.

BOARD OF TRUSTEES of the Village of St. Croix Falls, Wisconsin.

VILLAGE COUNCIL of the Village of Taylors Falls, Minnesota.

SEWER SYSTEM.

Searcy, Ark., April 27, 1910.

Sealed proposals will be received by the Board of Public Improvement, of Sewer District No. 1 City of Searcy, Arkansas, until 3 o'clock p. m., on the 25th day of May, 1910, for furnishing all material and constructing a system of sanitary sewers consisting of approximately:

2800 feet of 15 inch, 2700 feet of 12 inch, 2070 feet of 10 inch, 17960 feet of 8 inch, and 12150 feet of 6 inch tile pipe sewers, 125 manholes, 10 flush tanks and a sewage purification works, the latter consisting of a concrete tank, ejector station and filter.

Plans and specifications may be examined and blank proposals secured at the office of the Secretary of the Board in Searcy, Ark., and at the office of the W. S. Shields Engineering Co., 1201 Hartford Bldg., Chicago.

Each proposal shall be accompanied by a certified check made payable to J. Hicks Deener, Treasurer, for a sum of $300.00, as a guarantee that the bidder will enter into contract as required if awarded the work.

The Board reserves the right to reject any or all proposals.

BOARD OF PUBLIC IMPROVEMENT.
E. A. ROBBINS Chairman,
J. F. HEADLEE, Sec'y.
GEO. C. THOMAS.

STREET PAVING.

Billings, Montana, April 22, 1910.

Sealed proposals for paving certain streets and avenues of the City of Billings, Montana, described in Resolution No. 274, creating Special Improvement District No. 48, will be received by the City Council up to 8 o'clock p. m. of the seventh day of June, 1910, addressed to the undersigned, and endorsed: "Proposals for Vitrified Brick Paving."

The work for which proposals are invited consists of, approximately, 32,040 square yards of vitrified brick pavement, according to the plans and specifications on file in this office.

Each proposal must be made upon blanks furnished by the city, and accompanied by a certified check for $5.000 on some responsible bank in the City of Billings, and made payable to the City of Billings. The successful bidder must enter into an undertaking in the sum of thirty thousand dollars, with approved sureties. Plans and specifications may be inspected at this office. Anyone desiring a complete set of plans and specifications for personal use in submitting a bid may obtain the same upon application to the City Engineer, and by payment of five dollars to cover cost.

Payment will be made, on monthly estimates by the City Engineer, in warrants drawn upon the fund of Special Improvement District No. 48.

The city reserves the right to reject any and all bids.

By order of the City Council.
J. D. MATHESON, City Clerk.

STREET PAVING.

Billings, Montana, April 22, 1910.

Sealed proposals for paving certain streets and avenues of the City of Billings, Montana, described in Resolution No. 273, creating Special Improvement District No. 47, will be received by the City Council up to 8 o'clock p. m. of the seventh day of June, 1910, addressed to the undersigned, and endorsed: "Proposals for Creosoted Block Paving."

The work for which proposals are invited consists of, approximately, 22,644 square yards of creosoted block pavement, according to the plans and specifications, on file in this office.

Each proposal must be made upon blanks furnished by the city, and accompanied by a certified check for $5,000 on some responsible bank in the City of Billings, and made payable to the City of Billings. The successful bidder must enter into an undertaking in the sum of twenty thousand dollars, with approved sureties. Plans and specifications may be inspected at this office. Anyone desiring a complete set of plans and specifications for personal use in submitting a bid may obtain the same by application to the City Engineer, and by payment of five dollars to cover cost.

Payment will be made, on monthly estimates by the city engineer, in warrants drawn upon the fund of Special Improvement District No. 47.

The city reserves the right to reject any and all bids.

By order of the City Council.
J. D. MATHESON, City Clerk.

WATER-WORKS SYSTEM.

Searcy, Ark., April 27, 1910.

Sealed proposals will be received by the Board of Public Improvement, of Water District No. 1, City of Searcy, Arkansas, until 3 o'clock p. m. on the 25th day of May, 1910, for furnishing all materials and constructing a water works system consisting of approxiatemly:

1320 feet of 10 inch, 3400 of 8 inch, 39400 feet of 6 inch, 830 feet of 4 inch, cast iron water mains, 65 hydrants, 3 10 inch, 4 8 inch and 44 6 inch valves with boxes, also a pump room, a 60,000 gallon elevated steel tank, a concrete surface reservoir, an artesian well, deep well pump, centrifugal force pumps and a 75 K. W. engine generator, all with their respective equipments.

Proposal (a) shall include the furnishing of all material and constructing the distribution system complete with hydrants and valves. This proposal shall be accompanied by a certified check for $500.00.

Proposal (b) will be for the construction of an additional pump room and shall be accompanied by a certified check for $50.00.

Proposal (c) shall be for the elevated steel tank and its foundation and be accompanied by a certified check for $200.00.

Proposal (d) shall be for the construction of an artesian well and shall be accompanied by a certified check for $100.00.

Proposals for machinery, if separate shall include all equipment F. O. B. cars Searcy and be accompanied by a certified check of 5% of the amount of the proposal.

A proposal covering the entire work shall be accompanied by a certified check for $1,000.00.

All checks shall be made payable to J. Hicks Deener, Treasurer, and be submitted as a guarantee that the bidder will enter into contract as required if awarded the work.

Plans and specifications may be examined and blank proposals secured at the office of the Secretary of the Board in Searcy, Ark., and at the office of the W. S. Shields Engineering Co., 1201 Hartford Bldg., Chicago.

The Board reserves the right to reject any and all proposals.

BOARD OF PUBLIC IMPROVEMENT.

GEO. C. THOMAS.

FORT MEADE, S. D., May 2d, 1910. Sealed proposals, in triplicate, will be received here until 10 a. m., Mountain Time, June 1st, 1910, for constructing Concrete Dam and clearing reservoir site, in connection with Fort Meade, S. D., water system. Plans and specifications may be seen at offices of Chief Quartermaster, Dept. of the Missouri, Omaha, Nebr.; Dept. of the Colorado, Denver, Colo.; Dept. of the Lakes, Chicago, Ill.; Dept. of Dakota, St. Paul, Minn., and this office, at which latter place all information may be obtained on application. A deposit of $10.00 to insure return is required before plans are sent on individual application. Envelopes containing proposals should be endorsed "Proposals for Dam" and addressed to Constructing Quartermaster.

A Notable Series of Articles.

No more notable series of articles has been published in recent years than that describing the terminal work of the Pennsylvania R. R. in New York City, which is appearing in the *Proceedings* of The American Society of Civil Engineers. It has been the endeavor of ENGINEERING-CONTRACTING to lay before its readers such portions of these articles as have related specifically to methods and costs, but first and last, although the space taken up has been considerable, only a fraction of the whole has been given. We mention this with two purposes: First to urge such of our readers as are particularly interested to secure the complete articles and second to commend the officials of the Society instrumental in securing for engineers this comprehensive and authoritative account of a great engineering work, and also the authors who at no little labor have collected the various articles. Several of these articles are unique in the character of the data presented and altogether they make a record which has few equals in engineering literature. It should, we believe, be the purpose of the Society to assemble these articles in order in a single volume which engineers can purchase and have for use separate from the regular volumes of *Transactions*.

Standardizing the Bag of Cement.

Following a discussion of the subject at the last monthly meeting of the American Society of Engineering Contractors, the following resolution was voted:

Resolved, that it is the sense of this meeting that the American Society of Engineering Contractors adopt, and advocate for general use, as a standard bag of cement, one weighing ninety-four (94) pounds, and that this be considered the equivalent of one cubic foot.

This resolution places the Society alongside the other principal societies of cement users and we believe, expresses the sentiment and to a large degree the practice of contractors generally. We believe further as we have said before that engineers should fall in line and specify that a bag of cement weighing 94 lbs. net should be considered to be a cubic foot of cement in proportioning concrete by volume. The question is not an academic one, it is one of practical business. There are strong business reasons why the weight and the cubic foot should be got together in the commercial package of cement. The present weight of 94 lbs. net of a bag of cement is to all practical purposes established and cannot readily be changed. The engineer must make his volume unit correspond.

Seventy-Two Cities Now Under the Commission Forms of Government.

According to a recent count, 72 American cities have followed in the footsteps of Galveston, and have adopted a commission form of government. As we have previously explained, a small commission replaces the city council or board of aldermen, and, in most cases, the office of mayor also is abolished. The commission becomes not only the legislative but the executive head of the municipality. The members of this commission are presumed to be elected as a non-partisan board of directors to run the business of the city.

The remarkably rapid spread of this new form of city government indicates clearly the existing popular disgust with present political conditions in most cities. The ward politician appears destined to become an extinct species in the very near future. Not even the natural conservatism of the majority of mankind is likely to prevent a very rapid change in the prevailing form of city government, for the belief is deep seated that no change can possibly be for the worse.

The ultimate success of the commission form of government rests upon the character of the men selected as commissioners. It is our belief, however, that the task of selecting capable and honest men is greatly simplified by reducing the number to be selected. Also it is apparent that one honest commissioner has far greater power for good when he is not lost in a crowd, but stands conspicuously among a few who may be opposing him. These and other reasons strongly commend the commission form of city government, but the strongest commendation comes from the invariable success that has thus far followed its adoption.

We wish it were possible to provide, in every case, that at least one member of these city commissions should be a civil engineer. So large a percentage of municipal expenditure goes for civil engineering structures—sewers, streets, waterworks, etc.—that it is clearly the part of wisdom to have as one member of the commission a man who is not compelled to rely entirely upon others for advice in matters pertaining to engineering. We are perfectly familiar with the antiquated argument that expert engineers can be hired by a commission, and that an engineer on any such commission is apt to disagree and quarrel with engineers whom the commission may employ. The *Outlook* voiced this popular fallacy about two years ago in discussing the appointment of a member of the Board of Water Supply for New York City, and made the amusing blunder of commending the appointment of a man who was himself an engineer who had served with distinction in another executive capacity.

The city executive who is an engineer is certainly far more capable of judging whether engineers employed by the city are competent or not, and whether they are performing their work economically or not. The president of the Pennsylvania R. R. is a civil engineer, and so, too, was his predecessor. Is it not rather significant that this great railway is held up as a model of organized efficiency? What becomes of the theory that a civil engineer will disrupt an organization by professional quarrels? The theory is, and always has been, pure nonsense—and worse, for it has often stood in the way of the appointment of engineers to executive positions.

In the nomination of men for positions as city commissioners, the boards of trade or chambers of commerce will doubtless have important voice, particularly if citizens come to realize that the judgment of business men is apt to be more sound than that of the average voter. We commend to engineers the practice of joining these commercial organizations, if it is their desire either to take part in the business management of municipalities or to secure public positions of an engineering nature. We are acquainted with several engineers who have made themselves known to the business public in this manner and have subsequently secured and held important positions through the organized effort of business men.

Test of Sand Blast Finish for Concrete.— An experiment was recently tried, using the sand blast on a block of concrete to determine the feasibility of using the same method for finishing the Rocky River Bridge instead of bush hammering the surface of the structure. The bridge has an arch span of 280 ft. between springing lines, and the number of square yards to be surfaced by bush-hammering is about 10,000. The entire exposed surface of the bridge was "faced," during construction with a mixture of 1 to 4 cement and fine blue granite 2 ins. thick. It was desired to cut out the cement on the surface and show the granite. The experiment showed that about 80 lbs. pressure was necessary to accomplish the cutting with the sand-blast—only about 60 lbs. are used when cleaning stone or steel. The sand blasting required about the same time as bush-hammering, and the resulting cost was about the same by either method. It was also shown that the sand blast tended to expose all the defects in the surface and where any rough places in small cracks appeared, the blast cut into them and made them appear worse than before. Bush-hammer on the other hand tends to fill in any small cracks or defects in the surface and cover them up.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Method and Cost of Placing Concrete Lining Inside Cast Iron Lining of River Section of Pennsylvania Railroad, North River Tunnels, New York City.*

This lining was placed in stages, as follows: First, the invert; second, the duct bench; third, the arch; fourth, the ducts; and fifth, the face of the bench. This division can be seen by reference to Fig. 1. All the work was started on the landward ends and carried toward the middle of the river from both sides. Except where the Weehawken face of the iron was cleaned with scrapers and wire brushes, and washed with water. Any leaks in the calking and grummeting (all more than 12 months old) were required. All the grout hole plugs were examined, and the plugs in any leaking ones were taken out smeared with red lead, and replaced. The leakage in the calking was due to the fact that the tunnel had been settling slightly during the whole 12 months of pile tests, and, therefore, had opened some of the joints. After the calking had been repaired and the surface thoroughly cleaned, the flanges were covered with neat cement (put on dry or poured on in the form of thick grout) just before the concrete was placed.

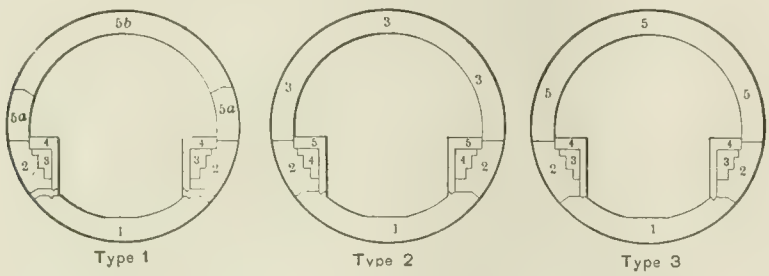

Fig. 1—Typical Cross Sections Showing Successive Stages in Placing Concrete Lining.

force passed the lowest point of the tunnel, nearly 900 ft. to the west of the middle of the river, all the work was down grade.

Before any concrete was placed, the surface of the iron was cleaned with scrapers and wire brushes, and washed with water. Any leaks in the calking and grummeting (all more than 12 months old) were required. All the grout hole plugs were examined, and the plugs in any leaking ones were taken out smeared with red lead, and replaced. The leakage in the calking was due to the fact that the tunnel had been settling slightly during the whole 12 months of pile tests, and, therefore, had opened some of the joints. After the calking had been repaired and the surface thoroughly cleaned, the flanges were covered with neat cement (put on dry or poured on in the form of thick grout) just before the concrete was placed.

Invert Concrete.—The form used for the landward type of concrete, that is, the one with a middle drain, consisted of a frame made of a pair of trussed steel rails on each side of the tunnel and connected at intervals with 6x6-in. cross-timbers; two "wing forms" were hung from this frame by adjustable arms. These wings formed the curved sides of the invert, the lip, and the form for the middle drain. The whole form was supported on three wheels, two on the rear end running on a rail laid on the finished concrete, and the third in front attached to the frame by a carriage and running on a rail temporarily laid on the iron lining. The form was braced from the iron lining by 6x6-in. blocks.

For the soft-groundtype of invert, namely, the one without the middle drain, a form of the same general type was used, except that the form for the middle drain was removed. After the form had been in use for some time, "key pieces" (made of strips of wood about 1 ft. 3 ins. in length and 3x3 ins. in cross-section) were nailed circumferentially on the under side of the wings at 2-ft. intervals. This was done because, at the time, it was not known whether ballasted tracks or some form of rigid concrete track construction would be adopted, and, if the latter, it was desirable not to have the surface smooth.

The concrete was received in cars at the rear end of the form and dumped on a temporary platform. It was then loaded into wheelbarrows on the runways, as shown in Fig. 2. The concrete was thrown from the barrows into the invert, where it was spaded and tamped.

In cases where there was steel-rod reinforcement, the concrete was first brought up to the level of the underside of these rods, which came between the wings; the rods were laid in place, and then more concrete was placed over the rods and brought up to the level of the bottom of the wings. Where there was no reinforcement, the concrete was brought up in one lift.

After this was finished, the concrete behind the wings was placed, thoroughly spaded and tamped, and, where there were longitudinal reinforcing rods, these were put in at their proper level. Where there were circumferential rods, the 16-ft. rods had already been put in when the lower part of the concrete was placed. As the invert was being finished off, the 8-ft. rods were embedded and tied in position.

The longitudinal rods were held in place at the leading end of each length of arch by the wooden bulkhead, through which holes were drilled in the proper positions. At the rear end they were tied to the rods projecting from the previous length. The quantity of water used in mixing the invert concrete

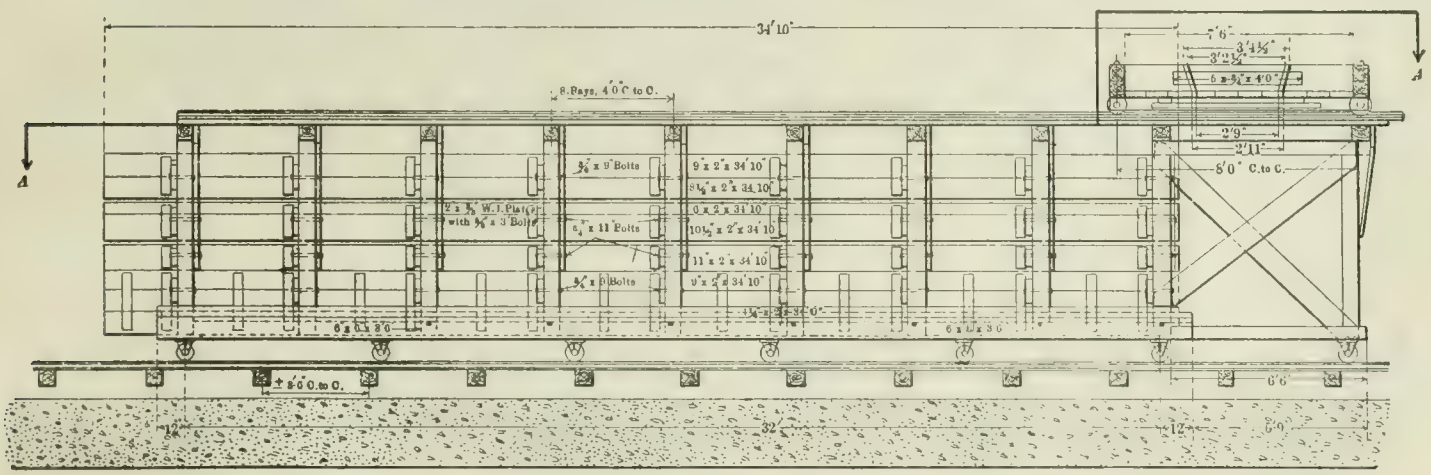
PLAN ALONG *AA* (FLOOR SYSTEM NOT SHOWN)



LONGITUDINAL SECTION ON CENTER LINE LOOKING TOWARD POWER CONDUIT BENCH.

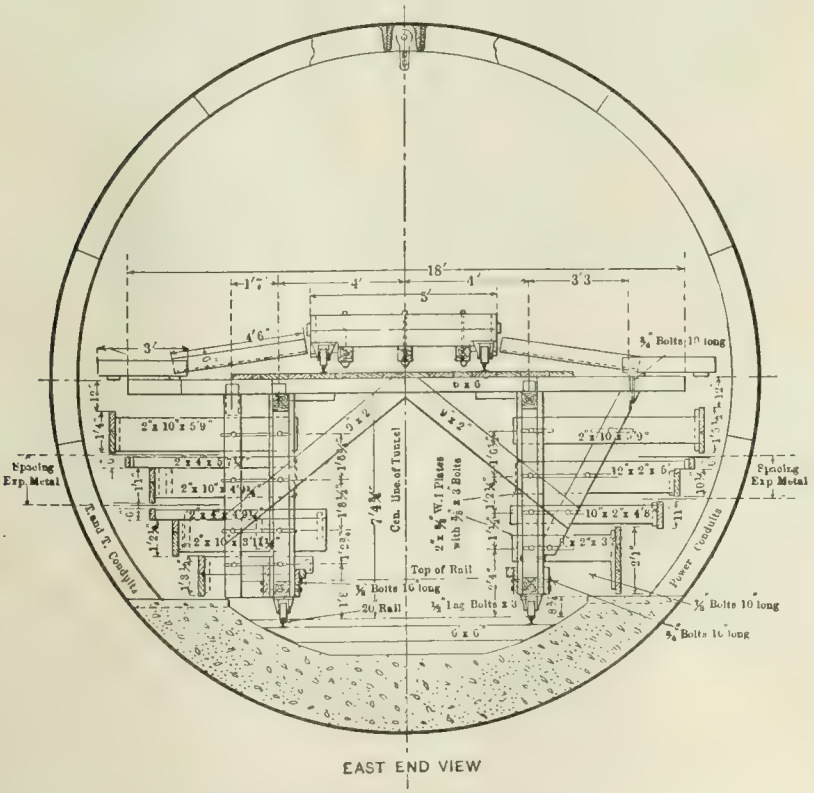


Fig. 3—Duct Bench Concrete Form.

needed very nice adjustment; if too wet, the middle would bulge and rise when the weight of the sides came on it; and, if too dry, it would not pack properly between the flanges of the iron lining. The difficulties as to this were often increased by the flow of accumulated leakage water from the tunnel behind on the concrete while it was being put in. To prevent this, a temporary dam of sand bags was always built across the last length of finished invert concrete before beginning a new length. A sump hole, about 4x4 ft. and 1 ft. deep, was left every 800 ft. along the tunnel, and a small Cameron pump was put there to pump out the water.

The invert forms were left in place about 12 hrs. after the length was finished. The average time taken to fill a length of 30 ft. was 7 hrs., the form was then left 12 hrs. and it took 2 hrs. to set it up anew. The total time for one length, therefore, was 21 hours, equal to 34 ft. per 24 hours. At one place, a 45-ft. form was used, and this gave an average speed of 45 ft. per 24 hours.

An attempt was made to build the invert concrete with forms (seeing that a rough finish was desired, as previously explained, to form a key for possible sub-track concrete), but it proved a failure.

1 Foreman at	$3.25 per shift
2 Spaders at	2.00 per shift
9 Laborers at	1.75 per shift

The average time taken to lay a 30-ft. length of invert was 7 hours; the two spaders remained one hour extra, smoothing off the surface.

For setting the form, the force was:

1 Foreman at	$4.50 per shift
5 Carpenters at	3.25 per shift
6 Carpenters' helpers at	2.25 per shift

The average time taken to erect a form was 2 hours, 1 carpenter and 1 helper remaining until the concrete was finished.

Duct Bench Concrete.—The duct bench is the portion of the concrete on which the ducts are laid. The exact height of the steps was found by trial, so as to bring the top of the ducts into the proper position with regard to the top and the face of the bench.

Both kinds of duct bench forms were of the same geenral type. A drawing of one of them is shown by Fig. 3. The form consisted of a skeleton framework running on wheels on a track at the level of the temporary transportation tracks. The vertical faces of the steps were formed by boards supported from the uprights by adjustable arms. The horizontal surfaces were formed by leveling off the concrete with a shovel at the top of the vertical boards. Where the sheets of expanded metal used for bonding came at a step, the lower edge of the boards forming the back of the step was placed 1 in. above the one forming the front of it; but, when the expanded metal came in the middle of a step, a slot 1 in. wide was left at that point to accommodate it. A platform was formed on the top of the framework for the form, and on this a car forming a sort of traveling stage was run. There was ample room to maintain traffic on a single track through the form.

The concrete, for the most part, was received at the form in ¾-cu. yd. dumping buckets. The buckets were lifted by the rope from a small hoisting engine. This rope passed over a pulley attached to the crown of the tunnel and dumped into the traveling stage on the top of the form. In this the concrete was moved along to the point where it was to be deposited, and there it was thrown out by shovels into the form below. For a portion of the period, while the duct bench concrete was being laid, it was not necessary to maintain a track for traffic through the form and, during that period, the concrete for the lower step was placed from below the form, the concrete being first dumped on a temporary stage at the lower track level.

Owing to the horizontal faces of the steps being uncovered, there was a tendency for the concrete there to rise when concrete was placed in the steps above. For this part of the work, also, it was necessary to see that the concrete was not mixed too wet, for, when that was the case, the concrete in the upper steps was very apt to flow out at the top of the lower one. At the same time, there was the standing objection to the mixture being too dry, namely, the responsibility of getting a sufficient amount of spading and tamping done.

In the section of the tunnel in which there were circumferential reinforcement rods in the duct bench, the rods were in place before the laying commenced, as they had been placed with the invert concrete. The circumferential reinforcing rods in the arch came down into the upper part of the duct bench concrete; these rods were put in position and tied to the iron lining in the crown at the same time as the duct bench concrete was being finished off. Openings for the manholes were left in the duct bench at the regular stationing.

The average time taken to fill a length of 35 ft. was about 6 hours; the form was then left in position for about 8 hours—usually enough to let the concrete set properly—and then moved ahead; it then took about 3 hours to set it up again ready to continue work. The total time for a length, therefore, was about 17 hours, equal to an average progress of about 49 ft. per day. The average force engaged in duct bench concrete (not including transport) was:

1 Foreman at	$3.25 per day
2 Spaders at	2.00 per day
9 Laborers at	1.75 per day

Arch Concrete.—By far the greater part of the arch work was put in with traveling centers before the face of the bench was built, in which case the whole of the arch was built at once. A short length of arch at each end of the tunnel was built after the face of the bench, in which case the haunches or lower 5 ft. were laid first and the upper part of the arch later.

The first traveling centers were used on the New York side, and were 50 ft. long. The laggings were of 4-in. yellow pine, built up in panels 10 ft. long and 16 in. wide for the sides, and solely longitudinal lagging 5 ft. long for the key.

It was pretty certain that the results to be obtained from forms of such a length would not be satisfactory, and this was pointed out to the contractor, who, however, obtained permission to use them on trial. Grout pipes were built in, as it was not likely that the concrete could be packed tightly into the upper part of the lining.

After about 300 lin. ft. of arch had been built with these forms, a test hole was cut out and large voids were found, and, to confirm this, another hole was cut, and similar conditions observed.

1 Foreman at	$3.25 per day
4 Spaders at	2.00 per day
12 Laborers at	1.75 per day

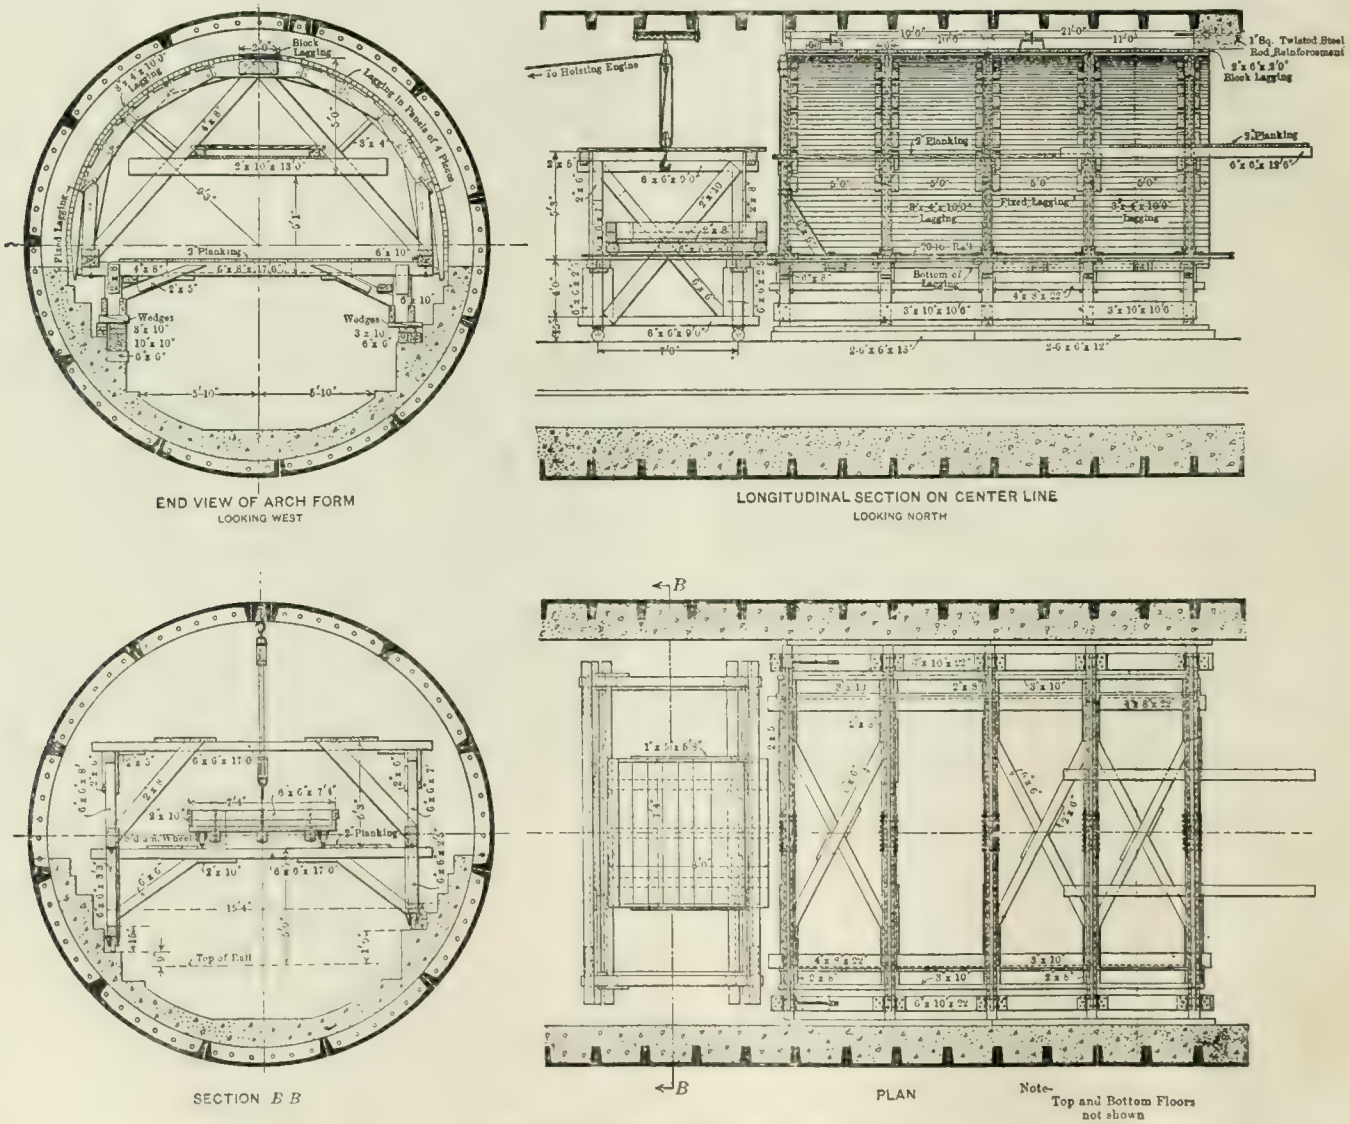

Fig. 4—Details of Arch Forms.

The results were so unsatisfactory that orders were given that the use of longitudinal key lagging should be discontinued, and cross or block lagging used instead. These block laggings were 6 ins. in length (in the direction of the tunnel) and 2 ft. in width; at the same time, the system of grout pipes was changed. It was soon found that with block lagging a better job could be made of packing the concrete up into the keys, but the time taken to "key up" a 50-ft. length was so great that the rest of the arch had set by the time the key was finished. Despite a lot of practice, this was the case, even in the unreinforced type. When the reinforcing rods were met, the time for keying up became still greater, and therefore the contractor was directed to shorten the forms to 20-ft. lengths. A typical working force for a 50-ft. length was:

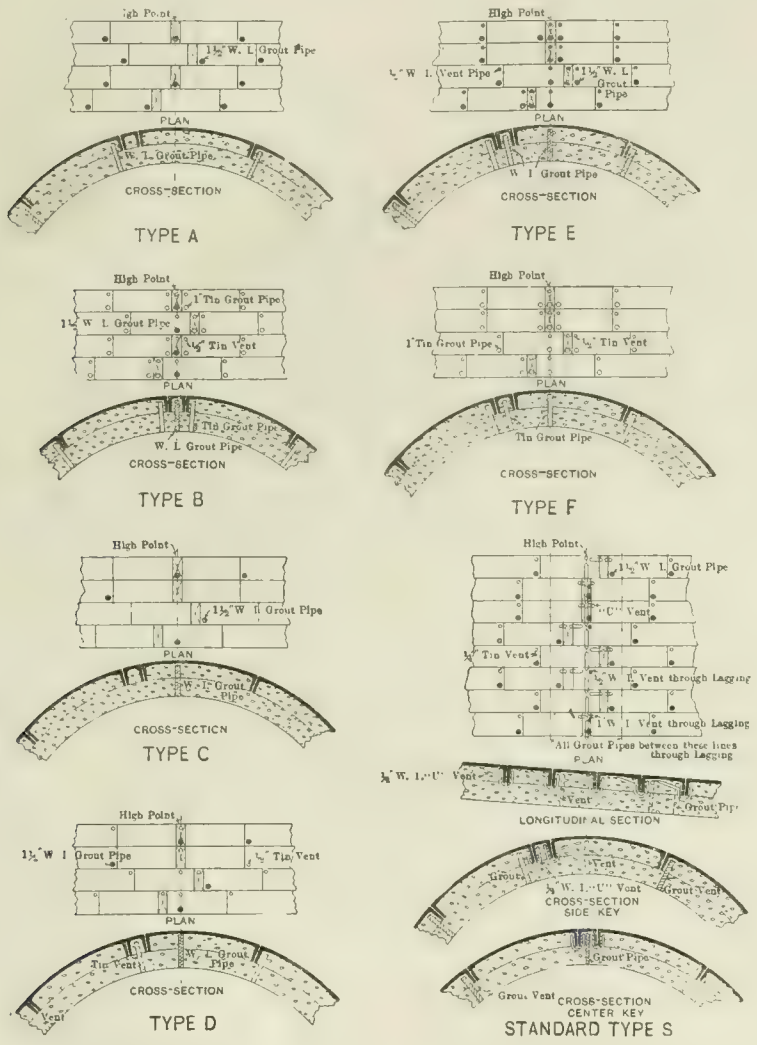

Fig. 5—Various Types of Grout Pipe Arrangement.

1 Foreman at	$3.25 per shift
2 Spaders at	2.00 per shift
10 Laborers at	1.75 per shift

Details of the 20-ft. forms are shown by Fig. 4. The lower 4 ft. of lagging was built on swinging arms, which could be loosened to allow the centers to be dropped and moved ahead. The rest of the lagging was built up in panels 10 ft. long and 1 ft. 4 in. high. The ribs rested on a longitudinal timber on each side; these were blocked up from the top step of the duct bench concrete. When the form was set and when it was released, it was moved ahead on rollers placed under it.

The concrete was received at the form in ¾-cu. yd. dumping buckets; from the flat cars on which they were run, these were hoisted to the level of the lower platform of the arch form. At this level the concrete was dumped on a traveling car or stage, and moved in that to the point on the form where it was to be placed. For the lower part of the arch, the concrete was thrown directly into the form from this traveling stage, but, for the upper part, it was first thrown on the upper platform of the arch. The hoisting was done by a small Lidgerwood compressed-air hoister, and set up on an overhead platform across the tunnel. The pulley over which the cable from the hoister passed was attached to the iron lining near one end of the form, and the traveling stage ran back from the arch form on a trailer, shown by Fig. 4. When it was impossible to hang a pulley—owing to the concrete arch having been built at the point where the trailer stood—an A-frame was built on the trailer, and the pulley was attached to that.

In laying the lower part of the arch, about 1 ft. of lagging (including the swinging arms) was first set, the other panels being pulled up toward the top of the arch. When that was filled, the next panel above was lowered into place, and the work continued. As the concrete rose toward the key, it was packed up to a radial surface, so that the arch would not be unduly weakened if the sides set before the key was placed. All the time, great care was taken to see that the concrete was carefully packed into the segments of the metal lining. The quantity of water used in the concrete was carefully regulated, more being used in the lower than in the upper parts of the arch.

In places where there were no reinforcing rods, the width of the concrete key was the length of the block lagging, namely, 2 ft. Where there was circumferential reinforcement, the key had to be more than 5 ft. wide, in order to take the 5-ft. closure rods used in the key. This naturally increased the time of keying very much. On the places where the 5-ft. longitudinal laggings were used, it was impossible to fill the flanges of the metal lining much higher than their undersides.

As the concrete used in the key had to be much drier than that used elsewhere, it was not easy to get a good surface. This trouble was overcome by putting a thin layer of mortar on the laggings just before the concrete was put in.

The overhead conductor pockets were a great hindrance to the placing of the key concrete, especially where the iron was below true grade. Whenever an especially troublesome one was met, a special grout pipe was put in to fill up unavoidable holes by grouting after the concrete had set. All the circumferential reinforcing rods were bent in the tunnel by bending them around a curved form of less diameter than the required bend. This generally left them all right in the middle of their length, but with their end portions too straight; in such cases the ends were bent again. All rods were compared with a template before being passed for use.

The arch forms were left up for 48 hours after keying was finished. Levels taken after striking the forms showed that no appreciable settlement occurred. An average gang for a 20-ft. length of arch was:

Table I shows the progress attained under various conditions.

Whenever the face of the bench concrete was constructed before the arch, the latter was built in two separate portions, that is, the bottom 5 ft., or "haunches" of the arch, as they were termed, were built on each side and the rest of the arch later. This involved the use of two separate sets of forms, namely, for the haunch and for the arch. Not very much arch was built in this way, and, as the methods were in principle precisely the same as those used when all the arch was built in one operation, no detailed description is needed.

No provision was made in the contract for grouting the concrete arch, but it soon became evident that by ordinary methods the top part of the concrete could not be packed solid against the iron segments, especially in the keys. As it was imperative to have the arch perfectly solid, it was determined to fill these unavoidable gaps with a 1 : 1 Portland cement grout, at the same time making every effort to reduce the spaces to a minimum. This made it necessary to build grout pipes into the concrete as it was put in.

The first type of grout pipe arrangement is shown as Type *A*, in Fig. 5. This was used with the longitudinal key laggings; when this method was found to be no good, and cross-laggings were used, the system shown as Type *B*, in Fig. 5, was adopted, in which vents were provided to let out the air during grouting. The expense of these pipes was high, and the contractor obtained permission to use sheet-iron tubes, which, however, were found to be unsuitable, so that the screwed pipes were used again. The contractor next obtained permission to try dispensing altogether with the vent pipes, and so Type *C*, in Fig. 5 was evolved. This, of course, was found to be worse than any of the other systems, as the imprisoned air made it impossible to force grout in. Several other modifications were made, and are shown in Fig. 5.

It was then decided to devise as perfect a system as possible, without allowing the question of cost to be the ruling factor, and to use that system throughout. In this system, shown as Type *S*, in Fig. 5, most of the vent pipes were contained in the concrete, and their size was independent of the thickness of the arch, so that they were easily fixed in position and not subject to disturbance while placing the concrete. This system was used for about 80 per cent of the total length of the tunnel, and proved entirely satisfactory. The machine used for grouting was the same as that used for grouting outside the metal lining.

The only compressed air available was the high-pressure supply, at about 90 lbs., a reducing valve, to lower this pressure to 30 lbs. was used between the air line and the grouting machine. This was thought to be about as high a pressure as the green concrete arch would stand, and, even as it was, at one point a section about 2 ft. by 1 ft. was blown out.

A rough traveling stage resting on the bottom step of the duct bench concrete was used as a working platform. In the earlier stages of the work the grouting was carried on in a

TABLE I.—AVERAGE TIME TAKEN FOR VARIOUS OPERATIONS CONNECTED WITH BUILDING CONCRETE ARCHES IN SUBAQUEOUS TUNNELS.

rather haphazard manner, but, when the last system of grout and vent pipes was adopted, the work was undertaken systematically, and was carried out as follows:

Two 20-ft. lengths of arch were grouted at one time, and, in order to prevent the grout from flowing along the arch and blocking the pipes in the next lengths, a bulkhead of plaster was made at the end of every second length to confine the grout.

After a section had been grouted, test holes were drilled every 50 ft. along the crown to see that all the voids were filled; if not, holes were drilled in the arch, both for grouting and for vents, and the faulty section was regrouted. An average of ¾ bbl. of cement and an equal quantity of sand was used per linear foot of tunnel. The average amount put in by one machine per shift was 15 bbl., and therefore the average length of tunnel grouted per machine per shift was 20 ft. The typical working force was:

1 Foreman at.....$3.75 per shift
1 Laborer running grout machine at ..... 2.00 per shift
2 Laborers handling cement and sand at ..... 1.75 per shift
1 Laborer tending valve and grout pipes at ..... 1.75 per shift

After the grouting was finished, the arches were rubbed over with wire brushes to take off discoloration, and rough places at the junctions of adjoining lengths or left by the block laggings were bush-hammered.

Face of Bench Concrete.—The form used for this portion of the work consisted of a central framework traveling on wheels, and, from the framework, two vertical forms were suspended, one on each side, and equal in height to the whole height of the bench. Adjusting screws were fitted at intervals both at top and bottom, and thus the position of the face forms could be adjusted accurately. The face forms were built very carefully of 3-in. tongued and grooved yellow pine, and one 50-ft. form was used for 3,000 ft. of tunnel without having the face renewed. Great care was taken to set these forms true to line and grade, as the appearance of the tunnel would have been ruined by any irregularity. Joints between successive lengths were finished with a V-groove.

The concrete was received at the form in dumping buckets; these were hoisted to the top of the form by a Lidgerwood hoister fixed to a trailer. The concrete was placed in the form by shoveling it from the traveling stage down chutes fitted to its side. The quantity of water to be used in the mixture needed careful regulation. The first few batches in the bottom had to be very wet, and were made with less stone than the upper portion, in order that the concrete would pack solidly around the niche box forms and other awkward corners.

The forms for the boilers and refuge niches were fastened to the face of the bench forms by bolts which could be loosened before the main form was moved ahead, and in this way the ladder and niche forms were left in position for some time after the main form was removed.

At first the forms were kept in place for 36 hours after finishing a length, but, after a little experience, 24 hours was found to be enough. In the summer, when the rise of temperature quickened the set, the time was brought down to 18 hours. The average time taken for a 50-ft. length was:

Laying concrete ..... 4½ hours
Interval for setting.....18 hours
Moving forms ahead and resetting.... 5 hours
Total .....27½ hours

The typical working gang was:

Laying Concrete:
1 Foreman at.....$3.25 per shift
2 Spaders at..... 2.00 per shift
8 Laborers at..... 1.75 per shift
Moving and Setting Forms:
1 Foreman at.....$4.00 per shift
10 Laborers at..... 1.75 per shift

After the forms were removed, any rough places at the lower edge, where the concrete joins the "lip," were bush-hammered; no other cleaning work was done.

Duct Laying and Rodding.—It will have been seen that the duct-bench concrete was laid in steps, in which the ducts were laid, hence the maintenance of the grade and line in the ducts was an easy matter. The only complication was the expanded metal bonds, which were bent up out of the way of the arch forms and straightened out again after the arch forms had passed. The materials, such as ducts, sand, and cement, were brought into the tunnel by the regular transportation gang. The mortar was mixed in a wooden trough about 10 ft. long, 2 ft. 6 ins. wide and 8 in. deep.

After the single-way ducts had been laid, all the joints were plastered with mortar, in order to prevent any foreign substance from entering the ducts. This was not necessary with the multiple duct, as the joints were wrapped with cotton duck. The ducts were laid on a laying mandrel, and, as soon as possible after the concrete was laid around a set of ducts, they were "rodded" with a rodding mandrel. Not many obstructions were met, and these were usually some stray laying mandrel which had been left in by mistake, or collections of mortar where the plastering of the single-way joints had been defective.

In the 657,000 duct ft. of conduit in the river tunnels only eight serious obstructions were met. That the work was of exceptionally high quality is shown by the fact that a heavy 3-in. lead cable has been passed through from manhole to manhole (450 ft.) in 6 min., and the company, engaged to lay the cables in these ducts, broke all its previous records for laying, not only for tunnel work, but also in the open.

The typical working force was:

Laying Multiple Ducts:
1 Foreman at.....$3.50 per shift
9 Laborers at..... 1.75 per shift
Laying Single-Way Ducts:
1 Foreman at.....$3.50 per shift
3 Laborers at..... 1.75 per shift
Rodding Multiple Ducts:
1 Foreman at.....$3.50 per shift
5 Laborers at..... 1.75 per shift
Rodding Single-Way Ducts:
1 Foreman at.....$3.50 per shift
5 Laborers at..... 1.75 per shift

The average progress per 10-hour shift with such gauge was:

Laying multiple ducts..... 4,000 duct ft.
Laying single-way ducts..... 1,745 duct ft.
Rodding multiple ducts..... 4,040 duct ft.
Rodding single-way ducts..... 2,532 duct ft.

Tests on Rate of Cooling of Concrete in the Gatun Locks of the Panama Canal.

Six resistance thermometers will be embedded in the walls of the locks at Gatun, in order to determine the degree of heat attained at various stages of the hardening of the concrete. The concrete is made of 1 part slow setting Portland cement, 3 parts sand, and 6 parts 3-in. rock. On account of the time that elapses between the mixing of the concrete and its delivery into the forms, the mixture is made about the consistency of thin plaster. After it is placed in some parts of the wall, large rock is added, forming a cyclopean concrete. From the time concrete begins to crystallize until it reaches its final set the increase in temperature is rapid. From the setting point the increase is slow, but usually continues during the whole of the hardening process, which is indefinitely long, probably lasting for several years. It is to gather data with regard to this hardening, and the heat produced by the chemical changes that accompany it that the thermometers will be embedded in the concrete.

The thermometer consists of three parts—(1) a resistance bulb; (2) wire connecting the bulb with an indicating instrument; (3) an indicating instrument. The resistance bulb is an iron cup in which there is inserted a specially prepared metal, the resistance of which to the flow of electric current varies directly as the temperature. This bulb is embedded in the concrete at any point desired, and two copper wires connect it with the indicating instrument. The wires are encased in lead armor to make them waterproof, and their resistance is determined at the time of installation and the corrections remain practically constant. Any number of bulbs may be connected with a single indicating instrument, but the indicator to be installed at Gatun is capable of registering for eight bulbs, although for the time being only six will be used. The indicating instrument and the switches connected with it are self-contained and mounted on a marble slab, the whole being easily portable. By closing the circuit of any thermometer, which is done by means of a push button switch, the resistance of that thermometer is measured, and the instrument records it in terms of temperature.

The thermometer is operated by one small storage battery giving approximately two volts at the terminals. The frequency with which the temperature will be taken, will be determined by the rate at which it changes from time to time. The results will be plotted with time as the abscissa, and temperature as the ordinate, and in this way a complete graphical record of the hardening and cooling of the concrete will be kept.

A Home Made Hand-Level.—At times a hand level is a very useful instrument, but a great many more times, it is not on hand when wanted. On such an occasion a simple substitute may be devised which will work admirably. A glass tube 26 ins. long is heated and bent to the form of a rectangle 8 x 5 ins. and is half filled with water, colored with ink. The ends are then heated and welded together. After cooling, the liquid can pass around the entire square. This tube is then tied to a stiff cardboard for protection. The surfaces of the liquid present a level line of sight just about as serviceable as that of a regular hand level.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Method and Cost of Excavating Land Sections of Pennsylvania R. R. North River Tunnels at New York City.*

A general account of the progress, method of work, plant used, and results obtained will now be given for the Land Tunnels. The work on these tunnels on the Manhattan side was carried on from the shaft at 11th Avenue and 32d St. In this short length of about 977 ft. there are no less than nine different kinds of cross-section. The reason for these changes is the fact that the two lines of track are here not straight and parallel to the center line between the tunnels, but are curved, although symmetrical about this center line. The various changes of section are to enable the tunnels to be built in straight lengths, thus avoiding the disadvantages attending the use of curved forms, and at the same time minimizing the quantity of excavation, an item which accounts for from 60 to 70 per cent of the total cost of tunnels of this type. Of course, there are corresponding and obvious disadvantages in the adoption of many short lengths of different cross-sections, and these disadvantages were well brought out in the course of the work; on the whole, however, they may be said to have justified their adoption.

These New York Land Tunnels were divided into three contracts, viz.: From Station 190 + 15 (the Portal to the open work of the Terminal Station at the east side of Tenth Avenue, New York City) to Station 197 + 60, called "Section Gy-East." The next contract, called "Section Gy-West Supplementary," extended from Station 197 + 60 to Station 199 + 20, which is the east side of Eleventh avenue. The third contract was called "Section Gy-West," and extended from Station 199 + 20 to Station 231 + 78 (the dividing line between the States of New York and New Jersey). Thus, for nearly all its length, this contract consists of shield-driven tunnel. The portion between Stations 199 + 20 and 199 + 91.5, however, was of the Land Tunnel type, and therefore will be included here. A fourth contract extended from Station 231 + 78 to the Weehawken Shaft at Station 263 + 50, and of this all but 230 ft. was of the shield-driven type, only the portion next to the Weehawken Shaft being of the Land Tunnel type.

The four contracts were let to one contractor (The O'Rourke Engineering Construction Company), and the work was carried on simultaneously in all four, so that the division into contracts had no bearing on the methods of work adopted, and these will now be described as a whole and with no further reference to the different sections.

Excavation.—Work was started on the New York side on April 18, 1904, the Weehawken shaft being at that date still under construction. The contractor found a shaft already prepared for his use, and cross-drifts at grade and at right angles to the future tunnels, and extending across their entire width. The first essential was to get access to the shield chambers, which were to lie about 330 ft. to the west of the shaft, so that the construction of these enlargements in which the shields for the subaqueous tunnels were to be built might be finished as soon as possible and thus allow the earliest possible start to be made with the shield-driven tunnels.

With this in view, two bottom headings, on the center line of each of the two tracks, were driven westward from the western cross-heading at the foot of the shaft. When about 138 ft. had been made in this way, the two headings were brought together and a break-up was made to the crown level of the tunnel, as the depth of rock cover was doubtful. From this break-up a top heading was driven westward to Station 200 + 30. While widening the heading out at Station 200 + 20 the rock was penetrated on the south side. The exposed wet sand and gravel started to run, and, as a consequence, a change in design was made, the shield chambers (and consequently the start of the shield-driven tunnels) being moved eastward from their original location 133 ft. A certain amount of time was necessarily spent in making these changes of design, which involved a rearrangement of the whole layout from the Terminal Station to the start of the River Tunnels. On July 5, 1904, however, the new design was formally approved. No sooner had this been decided than a strike arose on the work, and this was not settled until Aug. 1, 1904, but from that time the work progressed without delay.

A top heading was now driven over the original bottom heading west of the shaft, and at the same time the original cross-drifts from the shaft were amalgamated with and broken down by a heading driven at the crown level of the "Intercepting Arch" which here cuts across the ordinary run of tunnel at right angles and affords access to the tunnels from the shafts.

The excavation of the upper portion of the

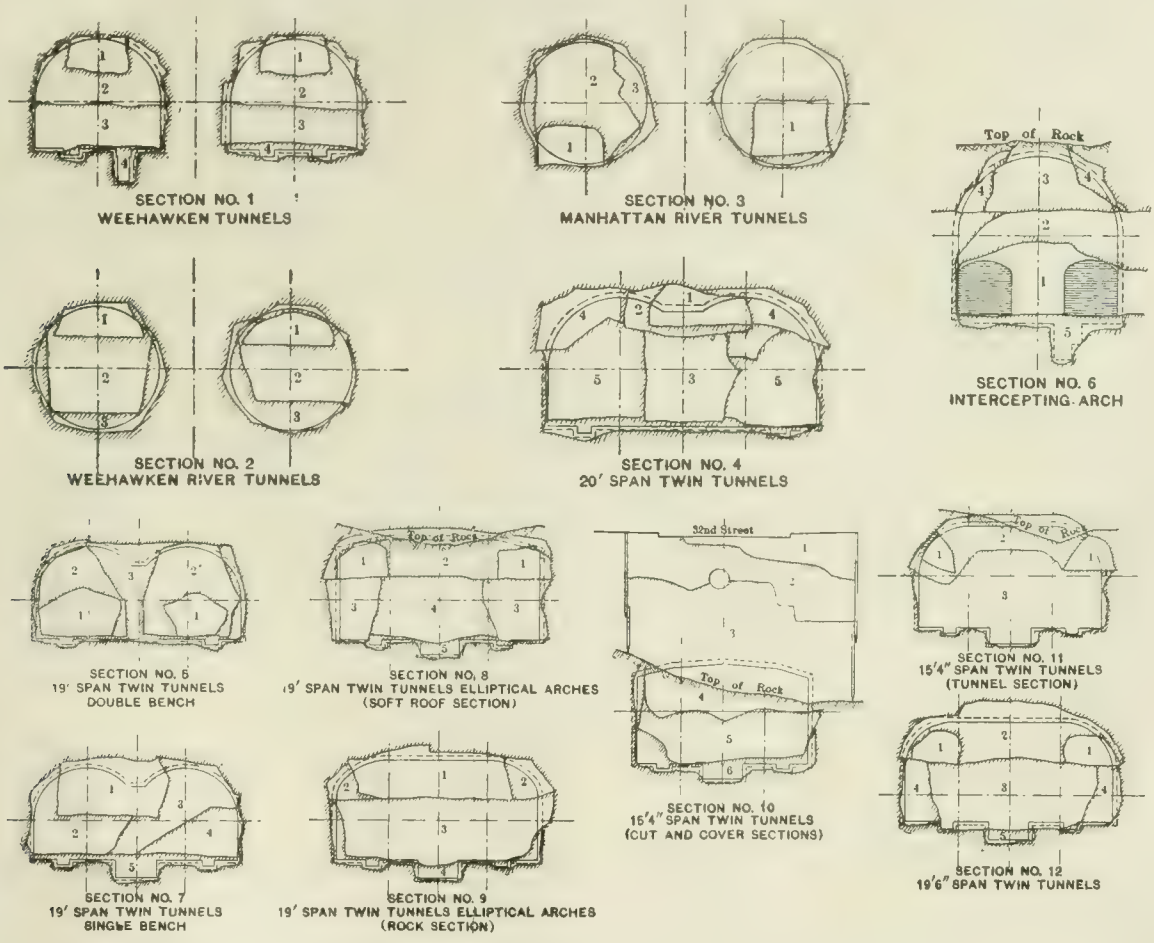

Fig. 1—Sketches Showing Sequence of Operations in Excavating Tunnels.
(Numbers show order in which sections were excavated; sections cross-hatched were excavated under a previous contract.)

*Arranged from a paper by B. H. M. Hewett and W. L. Brown, Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 690.

intercepting arch at its southern end gave some trouble, and caused some anxiety, as the rock cover was penetrated and the wet sand and gravel were exposed. This made it necessary to timber all this section heavily, and the tracks of the New York Central Railroad directly above were successfully supported. The general way in which this timbering was carried out will be described under the head of "Timbering."

Meanwhile, the excavation of the tunnels west of the intercepting arch was continued until the North and South Tunnels were taken out to their full outlines, leaving a core of rock between them. This core was gradually removed, and timbering supporting the rock above the middle wall was put in as excavation went on. The ground, which was entirely of micaceous schist, typical of this part of Manhattan, seamed with veins of granite, was rather heavy at the west end, or adjacent to the shield chambers, and required complete segmental timbering across the whole span. One heavy fall of rock in the core wall between the North and South Tunnels took place on Nov. 2, but fortunately as much rock as possible. In Section Gy-East the conditions were exceptionally variable, as the rock was subject to sudden changes from a soft crumbling mica schist to broad bands of hard granite, and, in addition, the rock surface was very irregular, and, for a good length of this section, was below the crown of the tunnel, a condition which led to the adoption of the cut-and-cover method for part of the work.

The irregularity in conditions called for varying methods of procedure, but in general the methods were as shown by Fig. 1 and described as follows:

In Solid Rock.—Where there was plenty of good rock cover, a top middle heading was driven, which was afterward widened out to the full cross-section of the twin tunnel arches. If necessary, a few lengths of segmental timbering were put in before taking down the bench, which was generally kept some 40 or 50 ft. behind the breast of the heading. After the bench was down, the middle conduit trench was excavated and the trimming done.

In Soft Rock.—Where there was not enough rock cover, or where there was actual continually in soft ground. To ascertain the extent of this condition the contractor decided to make soundings as far as 10th Ave., which was done by sinking trial pits and making wash-borings in the street. These soundings showed that there would be soft ground in the crown from Station 194 + 75 to Station 194 + 25 (at one point to a depth of 12 ft. below the crown), and on each side of this section the cover was insufficient from Station 193 + 58 to Station 195 + 30. This condition being known, it was decided to adopt cut-and-cover work for this length, the principal reasons being that repairs to sewers, streets, and drains would be no more, and probably less, expensive than with the tunnel method; the underpinning of a heavy brick brewery building adjoining the works on the north side would be facilitated, and the opening in the street, through which muck and materials could be handled, would relieve the congested shaft, through which the large volume of muck from the River Tunnels was then being conveyed. On the other hand, the cut-and-cover method was adversely affected by the presence of a heavy timber trestle built

did not extend beyond the limits of the permanent work. On Nov. 7, 1904, the excavation east of the intercepting arch was begun by driving a bottom heading in the South Tunnel. This was continued to Station 197 + 14 and then was taken up to the crown level and worked as a top heading with the view of keeping track, by making exploratory borings upward from the roof at frequent intervals, of the rock surface, which was here irregular and not known with any degree of certainty. The work was not pressed with any vigor, because all efforts were then being bent toward excavating from the River Tunnels soft ground in the roof, wall-plate headings at the springing line level were driven ahead of the remainder of the work. The wall-plates were laid in these, the roof was taken out in short lengths, and segmental timbering spanning from wall-plate to wall-plate was put in. The roof being thus held, the bench excavation proceeded without trouble. Where the rock was penetrated and soft ground showed in the roof, poling boards were driven ahead over the crown-bars, as shown by Fig. 2.

Cut-and-Cover Work.—After some 225 ft. had been driven from the intercepting arch, it was found that the crown of the tunnel was down the south side of the street and over which passed all the excavation from the Terminal Station, amounting to a very heavy traffic. As this trestle had to be supported, it complicated the situation considerably. Very little active progress was made between June, 1905, and April, 1906, as the contractor's energies during that time were much taken up with the progress of the shield-driven tunnels. In April, 1906, preparations were made to start a 50-ft. length of open cut, rangers being fixed and sheathing driven; and the sewer which ran down the middle of this street was diverted to the outside of the open-cut length.

April and May were occupied in driving the sheathing down to rock, supporting the trestle, underpinning the adjoining brewery, and excavating the soft material above the rock. On June 2, 1906, rock was reached, and, by July 31, the excavation was down to subgrade over nearly the whole 50 ft. in the first length. In the meantime another length was opened up, and eventually a third.

The surface of the rock now seemed to be rising, and the heavy buildings had been passed, so that tunneling was reverted to for the rest of the work, though many difficulties were caused by soft rock in the roof from time to time.

When the excavation for the open-cut work

The work done during the 5 months when these analyzed cost figures were kept includes 280 ft. of bench and 220 ft. of heading. This excess of bench over heading causes the general average amounts per cubic yard to be too low.
*Actual amount of excavation. †Amount of excavation paid for.

of the Terminal Station had advanced to the line of 10th Ave., the contractor started a heading from this point and drove westward under 10th Ave. until the headings driven eastward from the cut-and-cover portion, were met. This was done to expedite the work under 10th Ave., where the ground was not very good, where there were several important gas and water mains in the street, and where, moreover, the tunnels were of exceptionally large span (24 ft. 6 ins.), making a total width of some 60 ft. for the excavation. The excavation for the New York Tunnels was practically finished in January, 1908.

Drilling and Blasting.—The foregoing short description will serve to show in a general way the scheme adopted in making the excavation. A few details on drilling and blasting methods may not be out of place. Percussive drills run by air pressure were used. They were Ingersoll-Sergeant, Nos. 3½, A-86, C-24, and F-24. The compressor, without assistance, could supply air for nine drills, but, when fed by compressed air from the lower pressure, its capacity was increased three or four times.

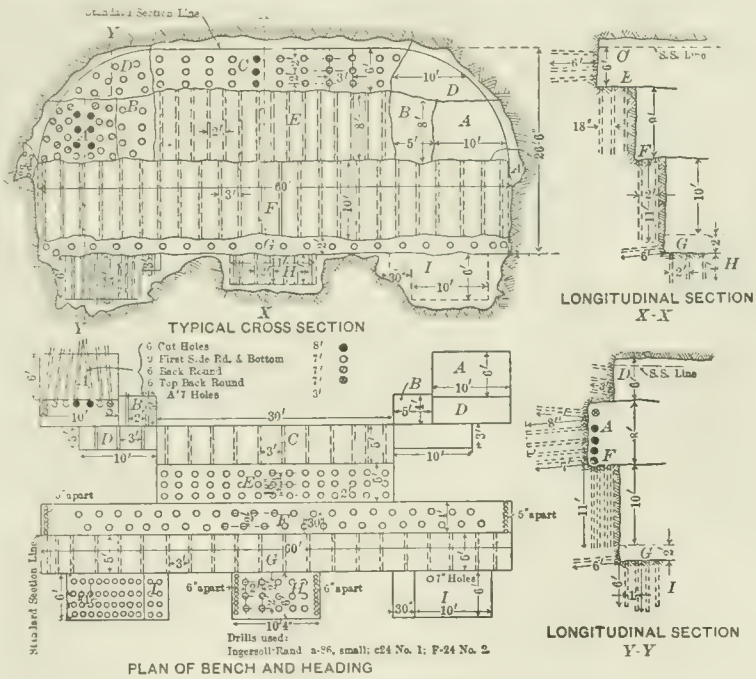
The air was compressed to 100 lbs. per sq. in. in the power house, and was delivered at about 80 lbs. per sq. in. at the drills. A 3-in. air line was used. The drill steel was 1⅛ to 1⅜-in. octagonal. The holes were about 3¼ ins. in diameter at starting and 2⅝ ins. at the full depth of 10 ft. The powder used on the New York side was 40 per cent Forcite, the near presence of heavy buildings and lack of much rock cover necessitating light charges and many holes spaced close together.

To compensate the contractor for the inevitable excavation done outside the neat lines of the masonry lining, the excavation was paid for to the "Standard Section Line" which was 12 ins. outside the neat lines on top and sides and 6 ins. outside at the bottom of the cross-section. The actual amount of excavation done was about 11 per cent greater than that paid for. The distance excavated beyond the neat line, because of the very heavy timbering necessary, was about 2.1 ft. instead of the 1 ft. allowed, and at the bottom about 0.85 ft. instead of the 0.50 ft. paid for.

For a period of 5 months detailed records were kept of the drilling and blasting. About 12,900 cu. yds. of excavation are included. A sketch and table showing the method of driving the heading, the number and location of the holes drilled, and the amount of powder used, is given by Fig. 3. From this and similar figures the information in Table 1 is derived.

Table II gives the rate and cost of drilling, and the cost of powder. It will be seen that the average rate of drilling was 2.71 ft. per hour per drill or 27.1 ft. per drill per shift.

Table III shows the result of observation as to the time taken in various subdivisions of



Sub-divisions	Volume of each sub-division paid for	No. of sets of holes	No. of holes in set	No. of times fired	Total lbs. of powder per hole fired	Linear feet of tunnel broken	Total length drilled	Total length of similar headings	Length drilled per linear foot of tunnel	Cu. yds. per linear foot of tunnel	Total feet drilled per cubic yard	Total lbs. of powder per linear foot of tunnel	Total lbs. of powder per foot drilled	Total lbs. of powder per cubic yard

the drilling operations. These observations were not carried on for a long enough period to give correct results, but the percentages of time spent on each division of the operation are believed to be about right. The headings of this table are self-explanatory. The necessary delays include all time spent in changing bits, making air-line connections, etc. The unnecessary delays are stoppages caused by lack of supplies or insufficient air pressure.

By Table II it will be noticed that the cost of labor for drilling and sharpening steels was about $0.29 per lin. ft. of hole drilled. The total cost, including repairs, supply of air, etc., came to about $0.38, as will be seen from Table IV.

Timbering.—On the New York side nearly the whole length of the excavation needed timbering, to a greater or less extent, and for the most part required timbering of quite a heavy type.

Whenever any considerable support was needed for the ground, segmental timbering was used. In most cases, this was supported by wall-plates at the springing line, and was set with an allowance for settlement, so that it would be clear of the work when the masonry lining was put in. As the twin-tunnel section involved the excavation of the North and South Tunnels at the same time, the cross-section of the upper part of the excavation consisted of two quadrants rising from the springing line and connected at the top by a horizontal piece from 19 to 28 ft. in length. This made a rather flat arch to support by timbering.

The timber for the segmental work was 12 x12 in. yellow pine. In light ground the bents were spaced at 5-ft. centers, in heavy ground 2-ft. 6-in. centers.

When the soft ground in the roof was struck, posts had to be used in the heading to support the caps. When the bench was removed, the posts were replaced by others down to the bottom of the excavation. These long posts were a great hindrance to all the work, and each replacement of short posts by long ones meant a settlement of the caps; consequently, it was decided to use in the section cast of the cut-and-cover, where all the ground was heavy, a temporary inner bent of segmental timber, within and reinforcing the permanent bent, and resting on separate wall-plates. This is shown by Fig. 4. These temporary bents were inside the work, and were removed as the arch was built. However, the caps settled considerably in some cases, so that it was not possible to do away with posting entirely.

In heavy ground the caps were set about 1 ft. above the neat line of the crown of the brick arch, in some cases they were set only 6 in. above, but the settlement was often more than this, causing great trouble in cutting out the encroaching timber when the arch had to be built.

In the tunnels east of the cut-and-cover portion, wall-plate headings were driven (shown by areas marked *A* on Fig. 3), and, when a length of wall plate had been set, the full-width heading was advanced a foot or two at a time, the timber segmental bents being set up as soon as possible; lagging was then driven over the cap into the soft ground. Fig. 4 shows the double set of segmental bents adopted in the 15-ft. 4-in. twin tunnels east of the cut-and-cover section.

When the soft ground came down so low as to interfere with the excavation of the wall-plate headings, a small heading was driven into the soft ground on the line of the ends of the caps, and lagging was driven down from this to the wall-plate heading, as illustrated in Fig. 2.

In the 19-ft. 6-in. tunnels the wall plate for the inner bent was supported by a side-bench, termed the "Raker" bench. This was left in position until the rest of the bench and the middle subgrade conduit trench had been excavated; it was then possible to support the caps by two rows of posts from subgrade level, take out the inner bents, and excavate the raker bench.

The 24-ft. 6-in. twin tunnels, which are at the extreme eastern end of this section, adjoining the open-cut work of the Terminal Station, and under Tenth Ave., were driven from the Terminal Station West, and the timbering had to be made very secure on account of the pipes and sewers in the street above. Detailed records were kept of the amount of timber used and the cost of labor and material expended in timbering. These records cover the same portion of tunnel as that for which the detailed records of drilling costs, previously referred to, were kept. These records are shown in Tables V and VI. It will be noted that the timber used in blocking, that is filling up voids outside the main timbering, amounted to more than two-thirds of the total timber, and that the cost of labor in erecting the timbering exceeds the prime cost of the timber by about one-third. The following distinction is made between permanent and temporary timbering. The permanent timbering is that which is concreted in when the masonry is built; the temporary consists of the lower bents and posts, which have to be removed when the masonry is built.

A typical day's working force for drilling, blasting, mucking, and timbering is shown in Table VII. Where there was any large quantity of soft ground in the roof, the timber gang was much larger than shown in Table VII and was helped by the mucking gang. The drillers did most of the mucking out of their heading before setting up the drills.

Fig. 4—Method of Timbering in Tunnel with Soft Roof.

Excavation of Weehawken Rock Tunnels.—This subject may be dismissed in a few words, as very few features of interest were called into play. The rock was of good quality, being the sandstone typical of this part of the country. Little or no timbering was needed, there were no buildings above the tunnel to be taken care of, and large charges of powder could be used.

Work was begun on Sept. 1, 1904, immediately on the completion of the work on the shaft. The North and South Tunnels in this case are completely independent. The procedure adopted was to drive a top heading on the center line of each tunnel and to break down the bench from this. The drilling was at first supplied with steam power from a temporary plant, as the contractor was at that time installing his permanent plant, which was finished at the end of November, 1904. At this time the rate of advance averaged 3½ lin. ft. of full section per day of 24 hours. By the

TABLE IV—ANALYZED COST OF DRILLING.

Items of Cost	Cost per ft. of Hole Drilled. 15 ft. 4 in.	19 ft. 6 in.	24 ft. 6 in.	Average	Cost per Drill Shift. 15 ft. 4 in.	19 ft. 6 in.	24 ft. 6 in.	Average.

The general scheme of excavation is shown by Fig. 1. The bench was kept 50 or 60 ft. behind the face of the heading. The powder used was 60 per cent Forcite. The general system of drilling was as shown in Fig. 5. The average length of hole drilled per cubic yard of excavation was 2.9 ft., as against 7.70 ft. at Manhattan; and the amount of powder used was 1.96 lb. per cu. yd., as against 1.24 lb. at Manhattan. There was little timbering. A length of about 30 or 40 ft. adjoining the Weehawken shaft was timbered, and also a shattered seam of about 17 ft. in width between Stations 262 + 10 and 262 + 27.

The two entirely separate tunnels gave a cross-section which was much more easily timbered than the wide flat span at Manhattan,

Colon Breakwaters.—After June 30, 1910, appropriations will be available for beginning construction on the $11,543,600 breakwaters to be constructed at Colon, Panama Canal Zone. Work has already been begun on the service buildings that will be required for the work. There will be two breakwaters. The west breakwater, extending from Toro Point at an angle of 42° 53′ from Colon light, will be constructed first. It will be about 10,500 ft. in length, with a width at the top of 15 ft., and a height above mean sea level of 10 ft. The width at the bottom will depend largely on the depth of water. The survey of the bottom of the bay along the line of the breakwater showed the greatest depth to be about 43 ft., and at this point the embankment will approximate 180 ft. in width. The east breakwater will be an isolated structure located at an interior angle of about 135° to the west breakwater, and will be about 5,700 ft. in length, with the other dimensions practically the same as those of the west breakwater. The amount of fill estimated required in the construction of the breakwaters is 4,915,000 cu. yds., about one-half of which will be material excavated on the Point for the core of the west breakwater, and the balance Porto Bello rock. The east breakwater will require about one-half as much material as the west breakwater, but the cost of construction will be relatively larger, because the fill will probably have to be made entirely by barges and scows. The construction of the inner end of west breakwater will proceed by driving piling for trestle on which a track will be laid and trainloads of material hauled out on it and dumped. The shore end will be built entirely of Toro Point rock, in order to observe the effect of wave action. The width of the ship channel between the ends of the two breakwaters will be 2,000 ft., measured at right angles to the center line of the Canal prism. The total cost of both breakwaters is estimated at $11,543,600.

On Sept. 30, 1909, there were under construction in Virginia 295.9 miles of roads built, or to be built, by state money aid or convict labor, at a cost of $352,720.40, including work in thirty-six different counties. Of this mileage of road, 187.42 miles are of macadam, costing $292,713.63; 55.8 miles are of gravel, costing $32,161.63; 52.6 miles are of sand clay, costing $27,845.12.

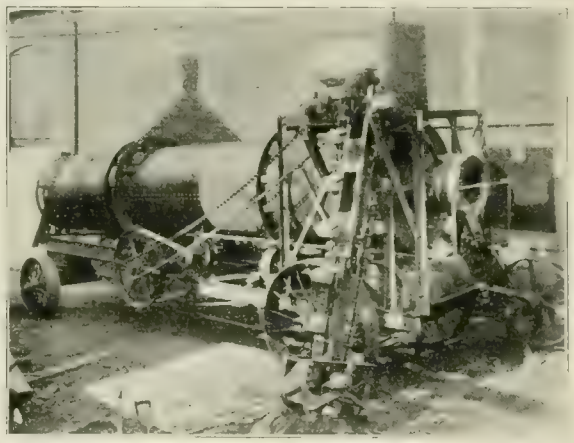
Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

A Portable Dryer for Heating Binder Stone.

In the construction of macadam roads to resist the action of heavy motor traffic by incorporating some stable, tough and elastic binder in the wearing surface, it is important that the stone should be quite dry in order that it may be thoroughly coated with the binder. It has been found almost impossible to make a bituminous material adhere to a stone that is full of moisture. The heating of the stone has the further advantage, especially in the mixing method of construction, that the mass may be much more thoroughly and easily mixed and handled.

The accompanying illustration shows a portable dryer and heater which has been designed for the heating of binder stone and sand for mixing with asphaltic binder to make top dressing for macadam or asphalt road. The machine was designed to heat the binder rock and sand to a temperature of 350°, so that it will be absolutely dry and when mixed with the asphalt will form a perfect bituminous concrete.



Portable Dryer for Binder Stone for Road Work.

The dryer is of the Ruggles-Coles type "A" double shell. The shell is made of 5-16-in. steel upon which is riveted two rolled steel tires and girth gear. The tires rest upon chilled ground bearing wheels and are supported on a rigid structural steel framework mounted on heavy wheels, 54-in. diameter, 10 in. face at the rear and 36-in. diameter and 8-in. face at the front. Mounted at the feed end is an elevator for feeding the stone or sand to the dryer; this elevator may be telescoped out of the way when it is desired to move the machine.

The fuel is fuel oil contained in a tank having a capacity for 10 hours' supply. The Rockwell type of burner is used, elevating the oil and burning it by compressed air. The oil is burned in the central flue, and the products of combustion pass to the delivery end through this central flue and back through the material and are carried out by an exhaust fan. At the delivery end, if desired, is bolted a double screen which will screen the material into three grades and deliver them into separate bins which are not shown in the photograph.

A test of this dryer and heater on April 15 at York, Pa., is stated to have shown the following results:

Crushed limestone carrying 2½ per cent of moisture was fed to the heater as fast as two men could shovel into the elevator. This was dried, heated and screened at the rate of 10.9 tons per hour and was delivered at a temperature of 450°. As the stone was measured before being fed a greater amount could not be handled than the quantity above stated. But in order to reach the capacity of the machine, a wet sand carrying 5½ per cent of moisture was afterwards fed to it with three men shoveling at the rate of approximately 13 tons per hour and was delivered and screened at a uniform temperature of 350°. The fuel consumption was 1.1 gallons of oil per ton of dried and heated stone, and approximately 1.8 gallons per ton of sand.

This machine weighs approximately 20,000 lbs. and is to be moved by means of a traction engine, which will also deliver the power for driving it. An independent oil engine can be supported on the framework for driving, if desired. The machine is made by the Ruggles-Coles Engineering Co., 51 Church St., New York City.

Methods of Constructing Bituminous Macadam Roads to Resist the Destructive Action of Heavy Motor Traffic.

At the First International Road Congress in 1908 the idea was brought out that in the construction of new and the resurfacing of old macadam roads which were to carry heavy motor traffic the binder should be incorporated in at least 2 ins. of the upper surface of the road. Experiments were conducted to develop this idea and the methods of construction thus developed may be divided into three classes: (1) The penetration method: where the binder is poured in from the surface, thus saturating a prepared top coating of stone; (2) the mixing method: where the binder is first mixed with the surface stone and rolled into place; (3) the prepared surface: where the surfacing is prepared at central points in large quantities, and delivered to the roadside ready to be spread and rolled into place. In a paper on the destructive action of motor traffic on roads read before the Engineers' Club of Philadelphia and printed in the Proceedings of the club, Mr. W. H. Fulweiler describes these three methods of construction and points out what in his opinion are their advantages and disadvantages. The matter that follows has been taken from Mr. Fulweiler's paper. This consists in first preparing a well compacted top layer of stone smaller than 1½ ins., and filling the voids by pouring in the hot fluid binder. In order that suc-

cessful results may be obtained, a number of points must be observed:

In resurfacing an existing road, the old surface should be picked up with a scarifier, brought to the proper cross-section and rolled. With new work, the foundation or lower course of the larger stone should be filled or sealed with some form of binder, either screening, sand, gravel or a mixture of these with loam. This is used to prevent the bituminous binder for the upper course running down into the foundation, where it would be of no use.

The stone for the upper layer is then spread to a depth that will give a finished depth of at least 2 ins., and, better, 2½ ins.

This stone should, if possible, be graded slightly, that is, sizes should be from 1½ ins. to ¾ in. As the rolling is started, a small quantity of ¾-in. stone should be spread evenly ahead of the roller so that the whole layer may be thoroughly keyed up from the bottom, and the larger surface voids filled with ¾-in. stone. The quantity of ¾-in. stone used will run from 15 to 20 per cent. The rolling should continue until a firm, compact surface is obtained, free from waves, but should not be carried on after the edges of the larger stones (particularly with limestone) begin to round off. When this layer is properly rolled and thoroughly dry, the binder may be applied.

The uniform distribution of the binder and its temperature are quite as important as the preparation of the stone. In order that the binder shall properly coat all the stone and fill the smaller voids, thus giving a well-bound aggregate, it is very important that its consistency at the time of its application should bear a proper relation to the temperature of the stone.

If the binder is applied too cool, it chills on the surface and does not flow freely into the smaller voids, and thus coat the lower stone, and an excess will have to be used to even cover the surface.

If, on the other hand, it is too fluid, it runs directly through the upper course of stone without leaving a coating of the proper thickness, and collects in pools on the binder of the lower course, where it rises in places to the surface, forming soft spots in summer. There is also a tendency to apply an insufficient quantity, owing to the ease with which it flows over the surface stone.

The subconscious effect of the fluidity on the man who is applying the compound is very interesting, as the amount applied per square yard can be varied quite widely by changing the temperature without the laborer being aware of it.

That the compound should be applied uniformly is, of course, self-evident, and there are a number of schemes for doing this. The earliest was the use of ordinary coal-scuttles, the flat lip delivering a fairly even ribbon of binder on the road. Garden sprinklers with either a specially punched rose or a thin, vertical, fan-shaped nozzle have been used on small stretches quite successfully. Light skeleton frames enclosing 1 or 2 sq. yds. of surface have been used as a guide to determine the proper amount to be applied.

On larger areas iron tank wagons are usually employed to heat the binder, and it is applied through a hose with a flat fan-shaped nozzle. This method has been improved recently by applying pressure from small cylinders of highly compressed air and the use of a spraying nozzle.

Several forms of mechanical distributing devices have been recently developed, which seem to do very efficient work. Their claim for recognition so far, according to Mr. Fulweiler, has been based more on rapidity than on uniformity of result, for the reason that the stone surface is not entirely uniform, and a skilful workman can apply just the correct amount at each point; while, on the other hand, the machine moves so rapidly that it is more difficult to quickly change its rate of delivery to suit varying conditions.

It will generally be found that the rate of progress with this method is dependent more upon the facilities for heating the binder to the proper temperature and delivering it to the work than upon the method of applying it. The time saved by rapid spraying is frequently lost by waiting for hot material, or in driving back and forth from the tank car or other source of supply, as an iron tank wagon holding 400 or 500 gals. is no mean haul. The great weight of a full tank wagon, even with wide tires, frequently causes ruts in the stone that are very difficult to roll out, and sometimes show in the finished surface.

The quantity of binder per unit of area varies quite widely with the depth, quality, and preparation of the stone and the skill and method of application. For a 2½-in. top layer it will require not less than 1.5 gal per square yard, and may run as high as 3 gals.; but from 1.5 to 1.75 gal. should, if properly applied, give a well-bound aggregate.

As soon as the binder has been applied, clean ½-in. stone should be spread evenly in sufficient quantity to just cover the surface without an excess, and the surface should be rolled.

A flush coat of very hot binder is then applied to seal off the surface interstices of the ½-in. stone and thoroughly cover it. This should require from ⅜ to ¾ gal. per square yard, depending principally upon the manner in which it is applied. It is essential, however, that the surface should be completely and thoroughly covered. About ¼-in. of fine stone screenings are applied over the flush coat to give a finish to the road, and protect the surface while the binder is setting up.

Under favorable conditions and proper workmanship this method yields very good results, but it is exceedingly important that every little detail be carefully watched.

Improper preparation of the lower or foundation course, lack of care in securing a dense and compact upper course, presence of excessive dust or moisture in the upper course, cold, damp weather, uneven distribution or the use of a binder not adapted to the conditions, and careless application of the flush coat, are all points which if overlooked or neglected will cause unsatisfactory results.

The fact that no special appliances beyond the heating tank are required and that the labor cost is low, brings this method within reach of the ordinary road contractor.

Methods of using non-bituminous binders.—There are two non-bituminous binders that are used in a manner somewhat similar to the penetration method. They are "Glutrin" and "Rocmac."

Glutrin is prepared from the waste liquor from sulphite process of making wood-pulp. It is a dark brown liquid of about 30° Beaumé, and is said to be a complex organic salt of calcium.

This is diluted with water and sprinkled on the road from an ordinary sprinkling cart, so that it is extremely easy of application. On drying, it yields a very hard and compact surface that is quite free from dust, and that seems to resist ordinary traffic very well. The length of time that it remains effective depends somewhat on the rainfall (as it is soluble in water) and on the traffic, but on roads not subjected to heavy motor traffic, it will apparently last through a season.

The other material is known as "Rocmac," and is said to be a compound having sodium silicate as a base, and sugar, mixed with powdered calcium carbonate, a pure form of limestone.

This mixture is applied to the depth of about an inch over the old surface, and the stone for the top course spread over it. The surface is rolled until the binder has filled the voids and rises on the surface. It is then swept evenly over the road, and a thin coating of limestone dust is sprinkled over it to protect it while setting up, which requires from two to six days. The compound combines chemically with the limestone, forming a cement, which serves to bind the wearing surface into a compact mass.

The Mixing Method.—In order to secure more complete control over the distribution of the binder, and a more compact stone mixture in the wearing surface, considerable attention has been devoted to the mixing method of construction.

This is but a development of the earlier form of tar macadam that has been used with varying degrees of success during the past 50 years. With the increase in our knowledge of the properties of binders and their preparation, and the proper working conditions for their use, which has resulted from the experimental work done both here and abroad during the past ten years, this form of construction has been brought very much to the fore. Already two State road authorities, Rhode Island and New Jersey, have decided to use it exclusively.

With this method the foundation course need not be filled, as in the penetration method, but it should be thoroughly compacted. In resurfacing old work—after the surface has been brought to crown, some form of bond should be provided between the old and new work. This is best secured by rolling in an even one-stone layer of 2½-in. stone.

A light sprinkling of tar oil is of considerable advantage before spreading the top course, as it penetrates the dust on the surface of the binding stone and secures a better adhesion of the tarred aggregate.

The important points in the preparation of the wearing surface are the grading and quality of the stone, the quantity and quality of the binder, and the method of combining them.

In general, the better qualities of trap and granite still retain their advantages when used in this method, but many rocks that would weather badly or be too brittle in the ordinary water-bound macadam, may prove very useful when incorporated with a bituminous binder, as the stone is protected from the atmospheric agencies to a considerable extent, is held more firmly in position, and is subjected less to internal attrition.

In the earlier form of tar macadam but little attention was paid to securing a compact mixture. Several courses of uniform sizes of stone were used, the finer at the surface. As the method was developed, the necessity for more careful and uniform grading of the mixture became apparent, and it has been found more desirable to have a reasonably large proportion of the larger size stone in the surface, with sufficient smaller particles to properly fill the voids and interlock and support the larger sizes.

The stone mixtures in use vary quite widely from the more or less complicated grading used in the Warren Bros. "Bitulithic" (where an attempt is made to reduce the voids in the stone mixture to a minimum by careful grading and the use of "dust" or "filler") to the rather more open mixture which is used by the Rhode Island Commissioners, and contains nothing smaller than ½-in. stone.

It is possible that the mixture with the minimum voids secured by the use of "filler" may be theoretically stronger, yet very satisfactory results may be secured with mixtures whose voids will run very much higher. The more open mixtures give very much less trouble in mixing, as the finer dust and stone particles have a tendency to collect the binder and roll into balls, so that the larger stone size does not secure a proper proportion of the binder. This is not so noticeable when using heated stone as when the stone is mixed cold. Various schemes have been proposed to obviate this difficulty, one being to mix the larger stone with a slight excess of binder, and then add the finer stone particles and dust.

Owing to the fact that the whole process is under complete control, the binder may be considerably heavier and stronger than that used in the penetration system. It is thus possible to use a semifluid binder, if desired, and to secure the maximum strength possible in the finished surface. Due regard must be paid to the behavior of the binder when exposed to low temperatures, as it is important that it should always remain elastic and show no tendency to become brittle and thus powder under the traffic. When the stone has been properly graded, the binder may become quite soft under summer temperatures without the surface yielding to any noticeable extent.

The quantity of binder varies with the grading of the stone. In very dense stone mixtures, owing to the larger percentage of the smaller sizes and the greater surface they expose per unit of weight, an additional amount of binder would be required, but to some extent this is reduced by the smaller

percentage of voids in these mixtures that have to be filled.

The percentage by weight will run from 5 to 6 per cent, to 8 or 10 per cent, the latter being used in mixtures containing a large proportion of fine screenings, sand, and dust. The average percentage for the usual mixture is about 6, so that a cubic yard of stone would require about 170 lbs. of binder.

It is exceedingly important that the stone should be quite dry in order that it may be thoroughly coated with the binder, but in summer weather it is not essential that it should be heated unless there is a considerable percentage of fine stone or dust in the mixture.

While heating the stone is both troublesome and expensive, yet the mass may be much more thoroughly and easily mixed and handled, trouble from damp stone is avoided, and better results may in general be expected when this is done. In cold weather it is, of course, quite essential.

The stone should be heated until it is thoroughly dry, about 200° to 225° F. being sufficient, while the binder should be heated to some point dependent upon its nature that will render it quite fluid, usually from 250° to 300° being sufficient.

The mixing may be done on movable wooden platforms, as in concrete work, or in some form of mechanical mixer. The blade type of trough mixer seems to give the best results, as its action is more nearly like that of the usual form of mixer used in the asphalt plants.

Usually two turns on the mixing board by hand will give a good coating. It is better to add half of the binder to the stone; turn once then add the remainder and turn again.

The mixed aggregate should be placed on the road as soon as possible, as it may then be handled with greater ease and there is less tendency for the binder to collect in the lower layers. If it must be hauled to any distance from the mixer, the pile as dumped from the cart should be carefully turned over before being placed, as there is a tendency for the stone to segregate in sizes and the binder to collect at the bottom. Bottom dump carts are particularly likely to leave the mixture in this condition.

In leveling the aggregate care should be taken not to bring an excess of the larger sizes of the stone to the top, as it is almost impossible to get them down again, thus leaving the surface rough and full of large voids.

As soon as the surface has cooled so that the roller may be used, a light rolling is given to insure a smooth surface. After several hours, when the body has cooled so that it will not slip, a thorough rolling is given until the surface is as compact and smooth as possible. At least a 10-ton roller should be used for the final finish, and a 15-ton would be preferable. A flush coat of very hot binder is then applied, as in the penetration method, to seal off the surface voids. About 0.5 to 0.7 gallon per square yard is required. This is followed by a light coat of hard, clean stone screenings and a final rolling. The screenings give a finish and tooth to the surface, which would otherwise tend to be "slick," especially in frosty weather.

The rate of progress by this method is necessarily much slower than with the penetration method, and the labor cost correspondingly much higher. Six mixers and two tar men, if kept supplied with materials, should mix and lay about 300 sq. yds. of 2½-in. top dressing per day. This rate of progress will require favorable conditions. With machine mixing and proper facilities this should be doubled.

Another form of construction is that known as the "Petrolithic" or "Imperial." With this method the old road surface is plowed up, harrowed, and thoroughly pulverized, and a heavy grade of asphaltic base oil is applied and thoroughly worked into the soil. The surface is then compacted by means of a rolling tamper. A layer of crushed stone is then put on the road and another coating of oil is supplied. A rolling tamper is then put on again until the surface is compacted, and final smoothing is generally given with an ordinary steam-roller.

Prepared Top Surfacing.—In order to obviate the difficulties in securing a properly graded and uniformly mixed aggregate for this form of construction, and the other attendant difficulties of preparing a uniform product at the roadside, a number of preparations have been brought out which are ready to spread on the road and roll into place.

Probably the first was "Tarmac." This is an English preparation made of graded slag, which is mixed hot with coal-tar and seasoned for some time before being used. "Tarfaat" is a similar mixture prepared of smaller sizes for surfacing only. "Tarlithic" resembles "Tarmac," but the aggregate is made of stone. "Quarrite" is tarred stone of uniform size. These are delivered in the different sizes and mixed on the road, the argument being that with stone of uniform size there are relatively fewer points of contact than in the graded mixtures, so that the aggregate can be more easily handled and a tougher binder employed.

In this country "Amiesite" has been used to some extent. This is a graded stone mixture and an asphaltic base oil, treated by a patented process with lime and sand. This material is supplied in two sizes, a larger size for the body of the road and a finer size for the surface. It has given very promising results. "Filbertine," an asphalt-stone mixture, is another preparation that has been recently put on the market.

The Wadsworth macadam is a prepared natural bituminous rock or sand. This material is spread on the 1½-in. stone and rolled into the interstices, thus compacting the whole layer and forming a smooth surface. At any distance from the mines the freight charges make it rather expensive, and it only works well under certain temperature conditions, and, like all natural products, the percentage of bitumen and the grading of the sand particles vary considerably.

The grading of the sand, moreover, is not very satisfactory, according to the present standards that have been evolved in the asphalt paving industry. It has given very satisfactory results, however, in some instances.

The principal labor cost in using these prepared materials is the handling from the car, as they have a tendency, especially in cold weather, to pack quite solidly, requiring both time and patience for their removal. Considerably more rolling is also required to compact them than in the other methods, as they yield quite slowly and must be rolled very hard to secure the best results.

The principal disadvantage so far in the use of these prepared materials is their high cost, which is due both to the high cost at the point of shipment and the necessity of paying freight on a long haul of the stone, which might otherwise be obtained locally.

Another point is the fact that, as in the penetration method, the quality of the binder must be sacrificed to some extent to enable the material to be handled and compacted for some time after its manufacture, and yet harden to such a point when in place that it shall acquire a proper strength to perform its function of resisting the action of the traffic.

When these points have been satisfactorily solved, the method seems to be an ideal one.

Mr. Fulweiler summarizes the relative advantages and disadvantages of these methods as follows:

Penetration System: Its disadvantages are:

1. The care necessary to secure a properly prepared upper course of stone.
2. The difficulty in obtaining uniform distribution of the binder through the wearing surface.
3. The necessity for using an excess of binder.
4. That the quality of binder must be sacrificed to some extent to the requirement of the method.
5. And that in cold or damp weather this method cannot be successfully used.

Its advantages are:

1. Low labor cost.
2. Quickness and ease of application.
3. No expensive apparatus required.

Mixing Method.—The disadvantages are:

1. High labor cost.
2. Slowness of application and trouble required in mixing.
3. More apparatus required.

Its advantages are:

1. Complete control over the distribution of the binder and resulting uniformity of the mixture.
2. Ability to use a more suitable quality of binder, and to effect a considerable saving in the quantity required.

Prepared Surfacing.—Its disadvantages are:

1. Very high first cost.
2. Trouble in handling during cool weather.
3. Quality of binder that must be employed.

Its advantages are:

1. Ease of application.
2. Uniformity of mixture.
3. No apparatus required.
4. Freedom for weather restrictions.

An Economical Outfit for Drilling Holes in Concrete.

A considerable amount of money has been spent in drilling holes in concrete. Occasions are bound to arise after concrete is in, which make drilling and cutting necessary. The Chicago & Northwestern Ry. Co. has several home-made outfits with which it is accomplishing its drilling by the use of air. At all stations where the track elevation is completed on the line through Evanston, Ill., an iron fence is being placed along the top of the retaining walls. Holes have to be drilled for the fence posts. The holes required are 1 in. in diameter and 9 ins. deep.

The plant is mounted on a flat car. Steam is furnished by a small traction engine of about 10 hp. capacity. The body of a locomotive tender is also placed on the car for coal and water supply. Two 8-in. Westinghouse air pumps, of the type used on locomotives, supply the air through two air drums each of about 15 cu. ft. capacity, connected in compound. Two pneumatic hammers are kept at work with this outfit. The air is kept at about 65 lbs. pressure. The hammers are arranged with a sort of chuck which contains the head of the drill which is about 18 ins. long. For twisting the drill while the hammer is working, the operator uses a wrench and twists it back and forth in a semi-circle. No water is used in the hole and the dust is blown out every minute or so by the use of the exhaust on the hammer.

It takes one man to run the outfit and two men drilling. A foreman on the job looks after this work and also looks after the gang which sets up the fence after the holes are drilled. Each hammer drills about 100 holes in 10 hours.

A Master of Chancery's sale was held at Elizabeth, N. J., on May 5, to sell the New Jersey Short Line Ry., extending from Elizabeth, N. J., to Milltown, connecting in the latter place with the "Fast Line." The "Fast Line," if constructed, will give an air line from Elizabeth to Trenton, crossing the Raritan River near Martin's dock. It is reported the Public Service Railway wants to get this right of way and then make a connection by means of the Camden & Trenton line to Camden. The Pennsylvania R. R. Co. also is reported to be eager to get this property.

The Baltimore & Ohio R. R., A. W. Thompson, chief engineer, Baltimore, Md., is planning extensive improvements in Baltimore and vicinity which will involve an expenditure of about $5,000,000. The railroad will tear down the Camden station and erect a new one for passenger purposes only, at the southeast corner of Howard and Camden Sts. When the present station is razed it is proposed to build a double track elevated road to the open country beyond Gwynn's Falls. This will eliminate all grades for the passenger business and trains can be operated at a high speed. The site of the present Camden station is to be made a freight yard, with the Camden warehouses as the storage points.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Experience with and Results from Municipal Water Softening.*

Municipal water softening is still in its infancy. Early experiences in municipal water softening in America were not satisfactory, but through no fault of the principles involved.

The theory of water softening is not new. The theory of the softening of waters containing a temporary hardness, due to calcium and magnesium carbonates held in solution, by the presence of free carbon dioxide, was enunciated by Dr. Clarke, of England, some fifty years ago. The treatment of such waters consists of the addition of lime water or milk of lime, applied in carefully regulated quantities. The resultant reaction is the immediate union of the added lime and the free carbon dioxide, causing the precipitation of calcium and magnesium carbonates.

Waters possessing permanent hardness, as well as those which are contaminated by mine or factory refuse imparting to the water metallic salts and free sulphuric acid in solution, cannot be thoroughly treated with lime alone. This hardness can be most economically counteracted by the use of lime and soda carbonate. This principal is familiarly known as the Porter-Clarke method, and although it was suggested over fifty years ago, no other process has been invented to supplant it during all these years. There are a number of different water softening systems on the market at the present time. The principal advantage of one system over another is simply one of economies in the distribution and use of chemicals and the removal of waste products of the process.

So far in this country water softening has been employed in municipal plants only when, to use the vernacular, the cities employing it have been "up against it." This was notably the case in Winnipeg, Canada; Oberlin, Ohio; McKeesport, Pa.; and Columbus, Ohio. Perhaps no city has ever been in greater need of nor has had a harder problem of water softening than the city of McKeesport, and the author was fortunate enough to be retained to devise a plan for its solution. For at least six months of each year the water of McKeesport was fit neither for man nor beast, nor for any commercial purposes whatsoever, save, perhaps, for street sprinkling. So bad was the water supply at McKeesport that it was characterized in the United States Geological Reports as the worst water in the country. It was so bad that, notwithstanding confirmatory reports upon the plans proposed from persons qualified to judge as to the probable outcome of the treatment, money for the construction of the plan was appropriated reluctantly by the governing bodies. In fact, each time that the Board of water commissioners applied to councils for an appropriation to carry on the work of construction, it was the signal for a tirade of abuse on the part of some members of councils against the throwing away of the people's good money for something that was sure to prove an absolute failure. By emulating the motto, "Keeping everlastingly at it brings success," we succeeded in completing the plant in record time under the greatest handicaps. So convinced was the author that the plant would handle the water satisfactorily even in its worst condition, that it was put into commission before its full completion. This was done because the river water was more highly acid at this time than at any previous time, and a test of the plant under such conditions was highly desirable.

The conditions existing during the first three months of the trying out period, viz: October, November and December, 1908, have not been duplicated since. During this period, also the water consumption in the city was so great, due to imperfect plumbing fixtures, which had been eaten out by the action of sulphuric acid contained in the untreated water, and to faucets left open in the vain hope that the quality of the water would thus be improved, that the plan was called upon to treat practically the full quantity which the plant was designed ultimately to treat.

The high acidity in the McKeesport water is due to the large amount of mine water discharged into the tributary creeks of the Youghiogheny River, and to the spent acids from the galvanizing works along the shores of the Youghiogheny. The washings from the coke beds is another contributary cause. Furthermore, the difficulties of treating the Youghiogheny River water have been increased during the last few years by the abstraction from the watershed of practically the entire flow of the Indian Creek, one of the main feeders of the Youghiogheny, and the transporting of this water for the benefit of the Pennsylvania Railroad into an entirely different watershed. The Indian Creek was one of the most permanent streams in the watershed, and the water from this stream went a long way toward counteracting the effect of the impurities in the river.

The acidity in the water for a number of years previous to the operation of the plant was as follows:

Year.	Average acidity. Parts per million.	Maximum acidity. Parts per million.
1901	43.0	125.0
1902	42.1	200.0
1903	34.5	140.0
1904	50.6	170.0
1905	32.1	80
1906	28.0	120
1907	43.4	133
1908 October to December	156.0	240
1909	33.0	210

The variable character of the water to be treated is indicated by the fact that the water has jumped from a hardness of 110 at 4 o'clock in the morning to a hardness of 510 four or five hours later, and from an acidity of 30 up to an acidity of 210 during the same period. To produce a uniform product from the plant under such conditions requires the greatest care and watchfulness on the part of the employes of the plant. A reasonably uniform product has been obtained.

The McKeesport plant was fully described by the author in a paper read before the Engineer's Society of Pennsylvania, and appears fully illustrated in their Journal for April, 1909. Novel features of the plant which might be mentioned, and which a year and a half of operation have given a sufficient test, are as follows:

The method of cleaning the settling tanks without emptying them or interfering in any way with the continuous operation of the plant. Carriers are built under the floor of the settling tanks. The carriers in each of the four tanks are divided into four zones. Small circular holes 7/8-in. in diameter, spaced 4 ft. apart, connect the bottom of the tanks with the carriers. The outlet end of each set of carriers is controlled by a valve. In cleaning the basins, the valve controlling each zone is kept open until the precipitated solids are removed, and the water runs free from sludge. The amount of water used in cleaning the settling tanks and baffling tank is approximately 1,700 gals. per day for each degree of hardness in the water.

Another novel feature in the plant is the economic use of wash water. The entire machinery is operated by a water motor on the top floor of the softening building. The waste water from the motor enters the wash water basin for the filters. This water, charged against the plant as power, should not be charged as wash water, thus effecting a substantial saving. The amount of wash water shown in the annexed table is, however, the actual amount of water used in washing the filters, and amounts to 0.72 per cent of the total amount pumped.

Still another feature in the McKeesport plant is the arrangement for the entry of water into and exit of water from the settling basins. The design of the plant allows the water to enter the settling tanks over a long weir with a relatively short travel through the tank to the long overflow weir, with a gradual reduction in velocity as it approaches the outlet weir. For a given capacity of tank the longer the weirs and the shorter travel through the tank to the overflow, the less the velocity, and consequently the greater the precipitation. The water as it leaves the settling tanks is perfectly clear and free from turbidity.

The character of the McKeesport water is so unusual that tables of cost of operation are apt to be misleading to other municipalities, because the persons seeking data of cost and practicability of water softening are apt to be swayed adversely in their opinions by applying to their own cases the costs of producing a softened water at other places, as for instance at McKeesport, without taking into consideration the possible differences in conditions between the water to be dealt with at different places.

The only fair way to analyze the cost of any particular plant is to weigh the cost thereof against the benefits to be derived therefrom. Bearing this in mind, we have on the one hand to consider, *(a)* first cost of plant; *(b)* cost of operation. As against this we must also consider, *(c)* the improvement in the water; *(d)* the decrease in operating expenses of the plant; *(e)* decrease in wear and tear upon the plant; *(f)* decrease in plumbing bills paid directly by private citizens; *(g)* the decrease in the cost of soap; *(h)* lengthening the wear of linens, flannels, and other fabrics; and *(i)* increase in the length of life or boilers.

Taking the case of McKeesport, the annual interest on the cost of construction is approximately $10,000.

The cost of operation for one year is $30,700.

The total cost of producing 4,000,000 gallons of softened filtered water a day is $40,700 per annum.

Against this we have the following saving.

Since the softening plant has been installed, the Water Department has dispensed with a number of its employes engaged on repaving curb connections whose wages, according to the president of the board of water commissioners, amounted to $15,000.

The private consumers expended annually in maintaining their plumbing fixtures over $35,000.

Since the softening plant has been installed, only 72 per cent of the water previously required is now pumped, thus making a reduction in the coal consumption of $6,090 per annum.

The reduction in repairs of plant amounts to $3,000 a year.

From the best evidence obtainable, the saving in soap and soap compounds alone amounts to over $10,000 a year, and the saving in the wear and tear in washing of fabrics of all kinds can be set down at $20,000 a year.

Summarizing these, we have, on the one hand, an added cost of treating the water of $40,700; and, on the other a saving, as enumerated above, of $89,090.

This balance sheet shows that the introduction of the water softening plant for the city of McKeesport, instead of being an added burden to the people, has proved to be a saving of $48,390 per annum.

As a side light upon the saving effected in the McKeesport plant, it may be stated that, before the water softening plant was put into commission, about 156 plumbers were at work in the city. Out of this number, only 46 were

*Paper by Alexander Potter read at the annual convention of the American Water Works Association April 26-30, 1910.

TABLE I.—SHOWING CHARACTER OF WATER TREATED, AMOUNT OF CHEMICALS USED AND COST OF TREATING AT McKEESPORT, PA., FROM FEBRUARY, 1909, TO MARCH, 1910

WEEK ENDING	CHARACTER OF WATER AND AMOUNT USED								TREATMENT OF WATER								COST OF TREATMENT OF WATER

left four months after the plant was put into commission, and at the present time about the same average number of plumbers are employed in McKeesport.

In making the above comparison, the author has not touched upon the saving in life due to the reduction in typhoid fever, which has been quite marked, for he believes it is not altogether fair to take the difference in the death rate for the year before and the year following the introduction of such an improvement, and credit this saving of life wholly to the water treatment plant, because for such a comparatively short period there may have been many other causes contributing to the reduction of the death rate. It is fair to assume, however, that no one factor was more responsible for the reduction in the typhoid fever death rate than the water treatment plant.

Beside all these considerations, there stands out prominently the fact that the McKeesport water now has that palatable, crisp, fresh taste which is delightfully refreshing—a quality often lacking in public water supplies. The water is acceptable for drinking, cooking and bathing alike. A greater cleanliness on the part of the people is also observed generally throughout the city.

The author presents herewith a table showing the characteristics of the water from week to week; also the amount of lime and other chemicals used in the treatment of it, together with the cost of treatment.

The plant at McKeesport includes a filtration plant, which is in itself an interesting study aside from the softening plant.

During the summer of 1909, when the bacterial count in the raw water ran from 5 to 100 or 200, the bacteria in the settled and filtered water showed increases over the number in the raw water. The numerical increase in the bacteria in the filtered water over the raw water completely annihilated removal or efficiency percentages and did not present a very creditable showing. Furthermore, it was impossible to determine the character of the bacteria on any one day until two days later, consequently there was always a possibility, when the raw water contained baccili coli, of their passing through the filter as well. It is important to note also that so far as the reduction of bacteria is concerned, the filters failed to produce any reduction over the settled water. In fact, it is the exception rather than the rule, that the bacterial count of the filtered water is lower than the bacterial count in the settled water; all of which goes to show that, in a water similar to that treated at McKeesport, it is possible to dispense with the filter entirely.

Consequently, in October, 1909, the use of hypochlorite of lime was used at the suggestion of the author, and has been in use ever since. The effect of the use of hypochlorite of lime has been to almost completely sterilize the water in the softening plant. The use of a sterilizing agent is a sufficient safety factor for destroying bacteria that would not otherwise be entangled and brought down with the precipitates in the settling basins. The amount of hypochlorite of lime used varies from two and one-half to twelve pounds per million gallons, and averages 4.0 lbs. per million gallons. In the McKeesport plant, the hypochlorite of lime is admitted at the entrance of the baffle mixing tanks about one hour before the soda is admitted to the baffle mixing tanks. The hypochlorite of lime is dissolved in the coagulant tanks, and the coagulant pumps are used for the application of the hypochlorite to the water.

No coagulant has been used since the application of the hypochlorite of lime. A remarkable condition exists with the water at McKeesport, where with 450,000 bacteria and 1,500 turbidity in the raw water, no coagulant was used, and yet a clear water was secured from the filters.

In the opinion of the author, there are very many towns in which the introduction of water softening, coupled with the use of some sterilizing agent, would present the most satisfactory solution of the water purification problem, and be commercially more desirable.

It is to be hoped that this phase of the question will receive greater attention than in the past, for it at once makes commercially available the treatment of waters for other than purely sanitary purposes. There are so many cities throughout the United States and Canada afflicted with hard waters, that the purely commercial aspect of water softening must demand attention to a great degree in the future than it has in the past. The benefits of a soft water are fully as valuable to the private citizen in the uses to which he puts his water supply as they are to the large manufacturing concerns which, it is well known, are being forced to install private softening plants for the preservation of their boilers, and the percentage of saving to the private citizen, by the introduction of softened water, will be found to be just as great proportionately as the saving to the manufacturer.

The average cost of chemicals at the Mc-

Keesport plant during the last year was as follows:

	Per ton of 2,000 lbs.
Lime	$ 8.30
Soda ash	18.00
Sulphate of iron	11.00
Alum	12.50
Hypochlorite of lime	42.00

The character of the water at McKeesport perhaps requires the application of a greater amount of chemicals per million gallons than any other water in the country, and the satisfactory results obtained, should go a long way toward dissipating the somewhat prevalent idea that the use of chemicals in water treatment is injurious to health.

Some Data on the Quantity and Cost of Bleaching Powder for Disinfecting Sewage or Effluent.*

Bleaching powder is an impure commercial product manufactured in large quantities abroad by some of the earlier chemical methods, and in this country at Niagara by modern electrolytic methods. Owing to the fact that in the latter case it is essentially a by-product of the much more important caustic soda industry, its present market price is very low, and in fact less than the cost of production on a small scale. Upon admixture with water it goes into solution only partially; a residue of carbonate of lime and an excess of free lime remaining in the tank as a white sludge. In practice it is desirable at large works to keep this mixture stirred up and to discharge the sludge with the solution; at smaller works economy indicates the use of the clear solution and the disposal of the lime sludge in a convenient manner. To the layman one of the most striking features of this process is the relatively small amount of disinfectant necessary. For crude sewage an amount of so-called "available chlorin" equivalent to about five parts per million parts of sewage, which amounts to about 125 lbs. of bleaching powder per million gallons, suffices. Upon the present market price of $25 per ton or less, it will be seen that the cost of bleaching powder necessary will be in the neighborhood of $1.70 per million gallons of sewage disinfected. By the use of the quantity indicated, disinfection is accomplished within a very few minutes, and storage periods of not over thirty minutes are ample. Sewage stronger than the average American sewage would require somewhat larger amounts than these indicated, but twice the quantity probably represents the maximum. For partially purified effluents, such as those resulting from trickling filters, lesser quantities are sufficient. At Baltimore three parts per million of available chlorin, or 75 lbs. of bleaching powder per million gallons were found effective in the disinfection of the trickling filter effluent. At Boston satisfactory disinfection of a similar effluent was accomplished through a period of six months by the application of three and a half parts of available chlorin. Effluents of a higher degree of purity can be disinfected with corresponding smaller amounts. The total cost of the processes, including interest charges and depreciation upon the necessary fixtures, labor and other items, will range from $1 or less in the case of effluents to about $3 in the case of crude sewages. These details are given in the accompanying table.

*Extract from a paper by Earle B. Phelps, Proceedings Engineers' Club of Philadelphia, April, 1910.

ESTIMATES OF THE COST OF OPERATION OF A PLANT FOR DISINFECTING SEWAGE OR EFFLUENT WITH CHLORIDE OF LIME. BASED ON A CAPACITY OF 5,000,000 GALLONS A DAY.

Available chlorin, parts per million.	Bleach, pounds per mil. gal. (approx.)	Time of contact, hours.	Cost Per Million Gallons. — Fixed. Storage tanks.	Other fixed charges.	Operating. Bleaching powder.	Labor.	Power.	Total.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Cost of Generating and Distributing Electricity for Lighting and Power, New York Edison Co.

In our issue of April 6 we gave the cost of generating and distributing electricity for lighting in Brooklyn. We now take up a similar analysis of the cost to the New York Edison Co. which produces nearly 70 per cent of the electricity used for lighting in New York city.

The following data are based upon this company's report for the fiscal year ending June 30, 1907:

Plant.—There are 8 generating stations having a total rated capacity of 108,300 kw., but two of these stations supply nearly 80 per cent of the current. There are 23 substations of 93,750 kw. capacity. The details of the plant equipment are as follows:

Station Equipment:	
144 boilers, water tube	76,382 HP.
45 superheaters	29,250 HP.
30 steam engines, direct connected	82,900 HP.
5 steam engines, belted	1,725 HP.
9 turbo-units, A. C.	53,500 KW.
21 generators, direct connected, A.C.	93,000 KW.
34 generators, direct connected, D.C.	14,100 KW.
3 generators, belt connected, A.C	900 KW.
2 generators, belt connected, D.C.	300 KW.
10 exciters, motor driven	1,400 KW.
3 exciters, steam driven	225 KW.
2x140 storage battery cells	12,000 A.H.
2 station transformers	2,500 KW
1 frequency changer	1,000 KW
Substation Equipment:	
100 rotary converters, etc.	93,750 KW.
276 transformers for rotaries	108,735 KW.
32x150 storage battery cells, 3 hr. rate	192,000 A.H.

The company had 70,533 meters in service and 34,531 arc lamps in service, of which lamps it owned about half, and 2,665,085 incandescent lamps. In round numbers there were the following amounts of circuits:

	Ft. of circuit.	Million feet of wire.
Direct current (underground)	10,183,000	4,619,000
Alternating current (underground)	1,000,000	179,000
Alternating current (overhead)	1,096,000	794,000
Total	12,279,000	5,592,000

There were 639,735 lin. ft. of streets occupied by pole lines. The underground wires occupied conduits rented from other companies, a rental of $1,000 per mile of single 3-in. duct per year being paid; aggregating a total of $845,000. This is an enormous rental, but it should be remembered that the Edison Co. controls the companies from which it rents the conduits.

The company owned 74,169 meters, the first cost of which is not reported. The Edison Illuminating Co. of Brooklyn owned 18,088 meters whose first cost averaged $18.40 each.

The company owned the following lamps:

1,957 arc—A. C., inclosed.
13,806 arc—D. C., inclosed.
1,813 Nernst.
6,522 Glowers.

The total number of arc lamps on its circuits Dec. 31, 1907, was 34,547, and the total number of incandescents was 3,056,777.

The operating expenses were as follows for the year:

Production Expense.	
1. Salaries	$ 35,908
2. Labor	508,773
3. Fuel	1,210,599
4. Oil, waste and sundries	54,565
5. Water	135,211
6. Repairs, buildings and structures	37,435
7. Repairs, motive power	211,175
8. Repairs, electric apparatus	22,631
9. Station expense	24,893
10. Purchased power	75,220
Total production expense	$2,316,418
Distribution Expense.	
11 Salaries	$ 64,146
12. Substation labor and expense	148,499
13. Rental of conduits, etc.	1,014,081
14. Incandescent lamp renewals	538,213
15. Wiring and jobbing (profit or loss)	139,713
16. Repairing and maint. street lamps	68,096
17. Repairs, substation bldgs. and apparatus	202,611
18. Repairs, poles and lines	21,716
19. Repairs, subways and cables	56,856
20. Repairs, meters	221,894
21. Repairs and expense commercial lamps	12,872
Total distribution expense	$2,388,698
General Expense:	
22. Salaries of officers	$ 51,241
23. Office salaries	335,825
24. Office expense	294,009
25. Legal expense	116,630
26. Advertising and soliciting	218,850
27. Insurance	118,393
28. Engineering and testing	78,707
29. Leaseholds, rentals, etc.	47,656
Total general expense	$1,262,311
30 Taxes, general	$ 702,628
31. Uncollectible bills	35,464
32. Depreciation and contingent expense	1,721,413
Grand total	$8,425,933

There were 299,172,431 kw. hrs. produced (at the switchboard) and 209,024,002 kw. hrs. sold (at the meters), showing a transmission loss of 30 per cent.

Since the plant capacity was 108,300 kw. and since there are 8,760 hrs. in a year, the total capacity was 950,708,000 kw. hrs. Therefore the average load was 299,172,431÷950,708,000=31½ per cent. Each kw. produced 2,760 kw. hrs. at the switchboard during the year, of which 70 per cent, or 1,932 kw. hrs. was sold.

The operating expenses per kw. hr. produced (at the switchboard) were as follows:

	Cents per KW. hr.
Production Expense:	
1. Salaries	0.012
2. Labor	0.171
3. Fuel	0.406
4. Oil, waste and sundries	0.018
5. Water	0.045
6. Repairs, buildings and structures	0.012
7. Repairs, motive power	0.070
8. Repairs, electric apparatus	0.007
9. Station expense	0.008
10. Purchased power	0.025
Total production expense	0.774
Distribution Expense:	
11. Salaries	0.021
12. Substation labor and expense	0.050
13. Rental of conduits, etc.	0.339
14. Incandescent lamp renewals	0.147
15. Wiring and jobbing	0.047
16. Repairing and maintg. str. lamps	0.023
17. Repairs, substation bldgs. and appar.	0.068
18. Repairs, poles and lines	0.007
19. Repairs, subways and cables	0.019
20. Repairs, meters	0.074
21. Repairs and expense commercial lamps	0.004
Total distribution expense	0.799
General Expense:	
22. Salaries of officers	0.017
23. Office salaries	0.113
24. Office expenses	0.098
25. Legal expenses	0.039
26. Advertising and soliciting	0.073
27. Insurance	0.040
28. Engineering and testing	0.026
29. Leaseholds, rentals, etc.	0.016
Total general expense	0.422
30. Taxes	0.235
31. Uncollectible bills	0.011
32. Depreciation and contingent expense	0.575
Grand total	2.816

The cost of operation was as follows per kw. hr. produced (at the switchboard) and per kw. hr. sold.

	Cents per KW. hr. Produced	Cents per KW. hr. Sold
Production expense	0.78	1.11
Distribution expense	0.80	1.14
General expense	0.42	0.61
Taxes	0.24	0.34
Uncollectible bills	0.01	0.02
Depreciation, contingency and renewal	0.57	0.82
Total	2.82	4.04

In considering these costs, it should be remembered that 35 per cent of the "Distribution Expense" is due to the rental paid for conduits at an exceedingly high rate. How high it really is can best be seen by studying the actual cost of similar conduits in Chicago, as given in Mayer's "Telephone Construction, Methods and Cost."

The item of "Depreciation and Contingencies" is worthy of special note, as it aggregates the large sum of $1,721,413. Of this sum $594,735 was actually charged off for depreciation, the balance going to a "contingency and renewal fund," which, so far as can be ascertained from the report, is but another name for a depreciation fund.

The report does not show what the plant actually cost, but it does show that $43,417,883 bonds have been issued, which doubtless represents approximately the actual engine cost, or about $400 per kw. capacity. Possibly additions, paid for out of earnings, have increased the cost to $500 per kw.

As throwing light on what such a plant may actually cost in New York city, the following data relative to the United Electric Light and Power Co. will serve. This company was incorporated in 1887, and on June 30, 1907, it was operating four generating stations of a combined capacity of 10,200 kw. Its cost of construction and equipment was as follows:

	Per KW.
Land for generating stations	$ 22
Land for substations	3
Buildings for generating stations	23
Buildings for substations	5
Electrical and steam apparatus (generating)	92
Substation apparatus	31
Construction cables	165
Subsidiaries	20
Tools and implements	2
Stable equipment	4
Office furniture and fixtures	1
Installation: Includes line transformers, meters, arc lamps, motors, etc.	142
Maps and instruments	3
Total	$523

The United Electric Light and Power Co. rented its conduits of which it occupied about 300 miles of ducts, and it had 820,000 million mil. ft. of wire.

In our issue of April 6 we showed that the first cost of the plant of the Edison Electric Illuminating Co. of Brooklyn was $437 per kw.

Let us express the cost of repairs on the New York Edison plant in terms of the kw. of rated capacity:

Repairs:	Per KW.
Station buildings and structures	$0.35
Motive power	1.95
Electric generating apparatus	0.21
Substation bldgs. and apparatus	1.87
Poles and lines	0.20
Subways and cables	0.52
Meters	2.54
Street arc lamps	0.63
Commercial arc lamps	0.12
Total	$ 8.37
Incandescent lamp renewals	4.46
Grand total	$12.83

If these repair costs are expressed in percentages of the probable first costs of the various items, it will be seen that they are all very low. It would seem, therefore, that the apparently large amount ($1,721,413) charged off for depreciation and renewals is none too high.

We have seen that the actual cost, as reported, was 4.04 cts. per kw. hr. sold. The average income was 6.49 cts. per kw. hr. sold. The plant represents a first cost of $500 per kw.—the interest charge at 6 per cent would be $30 per kw. We have seen that each kw. produced 1,932 kw. hrs. sold. Hence $30÷1,932=1.56 cts. This is the interest charge, which added to 4.04 gives a total cost of 5.60 cts. per kw. hr. sold. This would leave a profit of nearly 0.9 ct. per kw. hr. It should be remembered, however that we have assumed a high first cost, and that a high price was paid for rental of conduits. However, no exorbitant profit has been made although the profit has unquestionably been liberal.

The payroll was approximately as follows for the year ending June 30, 1907, based upon the payroll for the week ending June 29, 1907:

Employes:		Total.
881	General	$ 672,678
519	Technical	447,283
857	Generating plants	756,050
122	Substation plants	110,113
972	Distribution department	727,677
565	Construction department	450,694
98	Monthly salaries	256,306
4,014	Total	$3,420,801

This is equivalent to an average of nearly $16.40 per man per week. That this payroll is higher than normal is quite evident from the following tabulation of wage earners on the payroll June 30, and Dec. 31, 1907. The average wage is that paid by the Edison Illuminating Co. of Brooklyn, which presumably differed little from the New York Edison Co.

	June 30.	Dec. 31.
Foremen at $3.80	103	103
Assistant foremen at $4.03	43	44
Inspectors at $3.09	40	48
Engineers at $3.95	52	51
Firemen at $2.85	130	148
Coal passers at $2.22	31	47
Oilers and water tenders at $2.49	201	202
Electricians at $2.67	109	39
Electricians' helpers at $1.84	..	24
Dynamo attendants at $2.33	47	40
Switchboard attendants at $3.13	97	100
Machinists at $2.77	56	48
Machinists' helpers at $2.13	56	53
Blacksmiths at $2.43	9	8
Linemen at $2.44	14	13
Lamp trimmers at $1.66	37	30
Wiremen and helpers at $2.59	186	131
Meter readers at $2.96	36	37
Teamsters and stablemen at $2.40	96	72
Electric wage earners not elsewhere specified at $1.76	1,172	782
Total wage earners	2,515	2,020

The number of salaried employes and their weekly wages for the same time were as follows:

	June 30.	Dec. 31.
Canvassers at $25.48	71	55
Cashiers and bookkeepers, men, at $20.69	93	98
Cashiers and bookkeepers, women	25	26
Clerks (men) and salesmen at $15.93	395	343
Clerks and saleswomen at $8.71	36	40
Collectors at $23.36	29	34
Demonstrators at $14.46	1	..
Messengers, telephone operators, etc., at $6.87	55	47
Stenographers, men, at $10.58	39	36
Stenographers, women, at $13.01	65	57
Superintendents	17	17
Watchmen, elevator men, etc.	132	110
All other salaried employes	533	429
Total salaried employes	1,491	1,282
Grand total employes	4,006	3,302

The average weekly salaries are based on those paid by the Edison Illuminating Co. of Brooklyn.

For the half year, July 1 to Dec. 31, 1907, the total payroll was:

Officers (5)	$ 25,000
Salaried employes	626,955
Wage earners	988,320
Total	$1,640,275

During this same half year, 166,731,594 kw. hrs. were generated, and it required 4.11 lbs. of coal per kw. hr. generated. The coal was nearly all anthracite, less than 20 per cent being bituminous, and the average price was $1.96 per ton of 2,000 lbs. The high coal consumption and the low price indicate a very poor quality.

The reader will be able to make some very interesting comparisons between the unit costs given in this article and similar costs given in our issue of April 6.

The total length of railways in Mexico subject to federal jurisdiction is now 12,278 miles which with 3,000 miles of railways subject to the jurisdiction of state governments gives a total length of 15,278 miles. Since September, 1909, 99 new miles of track have been built on the federal railway system.

Results of Tests of Simple and Inexpnesive Surveying Instruments.*

Agricultural bulletins and instrument catalogs describe from time to time various simple and inexpensive devices and instruments for performing survey work. The demand for such apparatus usually comes from agriculturists or mechanics who have not had engineering training. Neither have they sufficient work to justify the purchase of the ordinary grade of engineer's instruments. The work on which such instruments is to be used is not of sufficient importance or magnitude to justify the employment of an engineer unless one should be near at hand. In many of our agricultural districts an engineer is not available except by the expenditure of considerable money for traveling expense and time. Unless this work is of considerable magnitude an engineer is not employed and agricultural improvements are carried on by such methods as the ingenuity of the workman may happen to devise.

Consequently there is apparently a field for an instrument that can be used by a person of ordinary mechanical ability; something between the range of the carpenter's level and square and the engineer's level and transit. The writer has had inquiries at various times for advice in regard to such an instrument. On examining into this subject he was not able to secure any definite data. Engineers who are competent to pass judgment on such devices use first-class instruments and have no time to experiment with second-class ones. Information in regard to second-class instruments or home-made devices simply state that such an instrument was used for a certain purpose and cost so much, there being no data given to indicate the range, efficiency and accuracy. Hence it appeared desirable that these various devices should be tested by one person under the same conditions, and that a study might be made of each, having in view its use by persons unskilled in surveying.

This test work was carried on during the summer of 1909 under the direction of the writer, at the University Farm, St. Paul, Minn., as part of the agricultural experimental work by the Division of Agricultural Engineering. The actual testing was done by Mr. H. B. Roe, a regular employe of the division, who had had ten years' experience in railway engineering work, assisted by Mr. Geo. F. Krogh, who is also a regular employe of the division as draftsman and general field assistant. All the field work and compilation of results was done by these two men, the object being to test each instrument in skilled hands and under the best conditions, and from that information determine its value under less favorable conditions. The land selected for the test was neither entirely level nor extremely hilly, but presented such topographic features as would ordinarily be found on farms where there would be a demand for this class of work.

In carrying out these experiments the following points of comparison have been kept continually in mind; (A) construction; (B) first cost; (C) simplicity of operation or knowledge necessary to adjust and operate; (D) the reach or range of sight and the consequent rapidity of work; (E) retentivity of adjustments under varying conditions of handling and weather; (F) results and remarks. For convenience each instrument tested is numbered and referred to by its number, the object being to determine the value of the general pattern of the instrument rather than the individual make of any special pattern.

In the elevation tests, readings were all taken on hubs, an engineer's 20-in. Y-level being used as a standard. Whenever a defect was detected in an instrument which was liable to be intensified by conditions of weather or change of ground, a special test was carried on under these conditions to determine their actual influence. The reach of the standard level was 500 ft. each way, or 1,000

*Abstract of a paper by J. T. Stewart, Professor of Agricultural Engineering, University of Minnesota, St. Paul, Minn., prepared for the annual meeting of the Illinois Society of Engineers and Surveyors.

ft. at a set up; with a self-reading rod, 1,320 ft. at each set up, ½ mile being covered with a self-reading rod in 30 mins.

No. 1 (Straight-Edge).—This was an ordinary straight edge 12½ ft. long, having a 30-in. leg on each end to raise the main part above the ground so that grass, rough ground, etc., between the stakes would not interfere with setting it. It is leveled by an ordinary carpenter's level attached to the upper side with a clamp. Complete cost: Carpenter's level, 75 cts.; wooden rod, $1; material in frame, $1.25; labor in making frame, $2.75; total $5.75.

The adjustment and method of using are the same as with the carpenter's level. The reach at each set-up is 12½ ft., ½-mile covered in 3 hrs. 5 mins.

Retentivity of adjustment was very poor, as variable humidity and windy weather made almost continuous adjusting necessary, due to warping and twisting. The results obtained by the use of this instrument were so unreliable that it can be of no use in survey work where levels are carried any distance when any degree of accuracy is desired. It is unwieldy in windy weather and the adjustments are rendered unstable by warping and twisting.

No. 2 (Triangle).—This instrument is a wooden triangle having a reach of 12½ ft. and is set level by a carpenter's level attached to a cross-bar with a clamp. Complete cost: Carpenter's level, 75 cts.; material in triangle, $1.50; labor making triangle, $4.24; total, $6.50.

Adjustment and method of using are the same as with the carpenter's level. The reach at each set-up is 12½ ft., ½-mile covered in 2 hrs. 20 mins.

Retentivity of adjustments was good, as they were not affected by weather changes. A triangle can be used to good advantage for preliminary levels when time is not an object. While the errors were somewhat variable the general results were fair. However, too much reliance should not be placed on it for setting long lines of grade stakes where great accuracy is required.

The same 30-in. standard carpenter's level was used on both Nos. 1 and 2. The bubble was too slow for accuracy when used in running long lines. A small level put up in a metallic case so constructed that it can be attached to a carpenter's square was tried, but it was worthless on account of the slow bubble.

No. 3 (Hose with Glass Tubes).—This outfit consisted of 25 ft. of a good grade of ¾-in. garden hose with a glass tube fastened in a 4-ft. length of hose coupled to each end. Complete cost: 25-ft. hose, $3.75; 8-ft. hose in 4-ft. lengths, $1.20; 2 couplings, 20 cts.; 2 glass tubes 18 ins. long, 20 cts.; 2 graduated rods, $2; total $7.25.

There were no adjustments. The reach was 25 ft. at each set up; ½-mile covered in 2 hrs. 20 mins.

It was sensitive to variation in temperature; as the water grows warm in the hose results become more unreliable, especially on sloping ground, the tendency being to run the elevation low. Where water is kept cool, either by using the instrument morning and evening, by frequent changes of water, or by working in cold weather, this instrument is simple, reliable and convenient. A 50-ft. length of hose tried, ½-mile being covered in 1 hr. 10 mins., but it was so heavy to drag that it was very tiring on the operators and caused the hose to wear. The errors due to varying temperature in the water were also increased.

No. 4 (Carpenter's Level with Sights).—This was the same carpenter's level that was used with Nos. 1 and 2, but fitted with the peep sights carried in stock for carpenter's levels and then mounted on a home-made tripod. Complete cost: Carpenter's level, 75 cts.; sights, 50 cts.; labor and material of making tripod, $9.75; flexible rod 6 ft. long, $1.50; total, $12.50.

It requires practically the same knowledge for adjustments and operation as is required for the engineer's Y-level. The reach with a self-reading rod, is 75 ft. each way or 150 ft. at a set-up; with a target rod, 200 ft. at a set-up. With a self-reading rod, ½-mile covered in 2 hrs. 15 mins.

Retentivity of adjustments was good. The results were very good. A better bubble in the carpenter's level would make this a very practical instrument.

No. 5 (Sighting Tube).—This was a factory-made instrument with a 1-in. sighting tube 10 ins. long, having a plain glass in place of an objective and a pin hole for an eye piece; it was mounted on a tripod. Complete cost, including a 6-ft. flexible rod, $16.

This requires the same knowledge for adjusting and using as the engineer's dumpy level. The reach with self-reading rod is 75 ft. each way, or 150 ft. at a set-up. With target rod, 200 ft. at a set-up. The ½-mile was covered with a self-reading rod in 1 hr. 15 mins.

Retentivity of adjustment is good, but very slow to adjust when adjustment is required. This instrument, as it came from the factory, had too large a pin hole in the eye plate and too coarse a cross hair. Tests showed it to be impossible to adjust closely or to obtain anything approaching accurate results. After the pin hole and cross wire were reduced to half the size good results were obtained. The elevations varied slightly from that of the Y-level. The bubble, however, was too slow.

No. 6 (Small Dumpy Level).—This was a small factory-made dumpy level with a 10-in. telescope and 1-in. objective glass, mounted on a tripod. Complete cost, including a 6-ft. flexible rod, $25. It requires the same knowledge to adjust and operate as the engineer's dumpy level.

Reach with self-reading rod, 400 ft. each way, or 800 ft. at a set-up. With target rod, 1,000 ft. at a set-up. The ½-mile was covered with a self-reading rod in 45 mins. Adjustments unreliable. This is a well put-up instrument with the exception of a slow bubble and no focusing screws. It gave fairly good results, but the slow bubble caused occasional variation.

No. 7 (Telescope and Leveling Plate).—This was a factory-made instrument consisting of a telescope passing through a metal disc which rests upon a circular plate. The bubble is placed parallel to the telescope in the top of the disc, the plate resting on the leveling screws. The disc and plate are not fastened to the tripod head and must be taken off and carried in the hand when moving from one station to another. Cost, including a folding wooden rod 10 ft. long, $15.

This requires the same knowledge to adjust and operate as the engineer's dumpy level. Reach with self-reading rod, 300 ft. each way, or 600 ft. at a set-up; with target rod, 700 ft. at a set-up. The ½-mile was covered with a self-reading rod in 1 hr. 30 mins. Retentivity of adjustments is fair.

This instrument compares favorably with the engineer's level, but there was a tendency to run high. This was probably due to the coarse, irregular cross hairs and the construction of the leveling disc, which had a tendency to rise or fall in correcting slight deviations of the bubble as the telescope rotated on its vertical axis.

No. 8 (Telescope in Box).—This instrument has a telescope 9 ins. long, with a ⅝-in. objective, placed in a rectangular metal box 7½ ins. long and 2¼ ins. wide, the leveling bubble being placed in the upper side of the box. The instrument is attached to a tripod by means of a ball and socket joint with a leveling plate. Complete cost: Instrument, $30; 6-ft. folding leveling rod, $1.50; total, $31.50.

It requires the same knowledge to operate as the engineer's level. It is very hard to adjust, as it has no capstan screws and there is no provision for making the horizontal cross hair horizontal except when the instrument is manufactured. In the instrument tested this hair was not horizontal.

The reach with self-reading rod is 400 ft. each way, or 800 ft. at a set-up. With target rod, 1,000 ft. at a set-up. With a self-reading rod, ½-mile was covered in 1 hr. While this instrument is intended to be simple, it is really complicated, with no particular advantages. It did very good work in skilled hands but undoubtedly would be a failure in the hands of an amateur.

No. 9 (Architect's Dumpy Level).—This was a small factory-made level listed as an architect's dumpy level. It has an 11-in. telescope with a 1⅛-in. objective, being constructed the same as an engineer's dumpy level. Complete cost: Instrument, $45; flexible rod, $1.50; total, $46.50.

No. 10 (Convertible Y-Level).—This was a factory-made instrument listed as an architect's convertible Y-level. It is a combination level and transit. It can be set up as a Y-level, and the telescope can be taken out of the Y's. The detachable horizontal axis screws into the sides of the telescope and when placed on the Y's it can be used the same as a transit. Complete cost: Instrument, $75; flexible rod, $1.50; total, $76.50.

The following applies to Nos. 9, 10 and 11 (the last being an "architect's Y-level"). Each requires the same knowledge to adjust and operate as an engineer's level. Reach with self-reading rod, 400 ft. each way or 800 ft. at a set-up; with a target rod, 1,000 ft. at a set-up. The ½-mile was covered with a self-reading rod in one hour. The retentivity of adjustments is as good as with the engineer's level. The plan and construction of these instruments is the same as the standard engineer's instruments, but they are smaller and lighter, consequently their range is somewhat less. The sensitiveness of the bubbles is well suited to the magnifying power of the lenses.

While these tests were primarily made to determine the value of each instrument as a level, some of the instruments were arranged for the approximate measurement of angles. Consequently, an area was laid out and the angles measured with such instruments as had a compass or circle attachment. An engineer's plain surveying transit was used as a standard.

No. 5. A circle 3¼-in. diameter, graduated in degrees, was under the telescope. A metal arm attached to the spindle moved on the inner side of this circle and revolved with the telescope. No. 6 had practically the same angle attachment. In No. 7, the 4-in. metal disc had a zero line on one side, and revolved on the inner surface of the plate, which was graduated in degrees. In No. 8, a 3-in. compass was attached to the top of the box. In No. 10, a 3-in. compass was inside the circle on the bar which carried the Y's while on the outside and beneath the bar was a vernier which moved on a 3½-in. circle divided into degrees. In No. 11 (architect's Y-level), the bar which carried the Y's, had underneath it a 3-in. circle graduated in degrees. The sides of the bar were curved outward in a circle, and one of the sides carried a vernier which moved on the upper surface of the circle.

Summary of Factory Instruments.—None of the factory-made instruments were entirely satsfactory, until No. 9 (the architect's dumpy level) was reached. This seems to be the cheapest instrument that can be really depended on. Such an instrument, including a satisfactory rod, would cost $41. If it is desirable to have an instrument that can be used for measuring angles, it then becomes necessary to get the architect's Y-level No. 11. This instrument, with the same rod as above, would cost $51.

All of the factory instruments preceding No. 9 were unsatisfactory or faulty in some respect, as in the effort to meet the demand for cheap instruments the instrument makers have turned out crudely made instruments, not thoroughly tested. Too much care has been taken to secure a good telescope, without proper regard to the cross hairs and sensitiveness of the bubble. The fact that the accuracy of the leveling instrument is dependent on the bubble rather than the magnifying powers of the telescope seems to have been overlooked. All of these cheaper instruments have very light tripods, and the rods that come with them are only makeshifts and of little value, being either poorly made or too short for actual service.

Conclusions.—From the experiments the following conclusions can be drawn. The small levels usually carried in stock by hardware men are worthless when used as bubbles on crude surveying instruments. The bubble of the ordinary carpenter's level is not of sufficient sensitiveness to insure at all times good results when used on an instrument for running long lines.

The straight edge is not satisfactory as a surveying instrument.

A triangle is of considerable value where great accuracy is not required. Its sufficiency could be considerably increased by using a better grade bubble than comes in the ordinary carpenter's level.

The 25-ft. length of hose is the best instrument for the inexperienced person to use. Its accuracy is good when the conditions named under No. 3 are observed. There is only a small outlay in the intial cost, for garden hose can be used for other farm purposes.

The smallest sum that can be invested in an outfit that will be reliable and give satisfactory results is $41 for an equipment which will not measure angles, or $51 for an equipment that will measure angles. The knowledge to adjust and operate them would require a general knowledge of the engineer's level.

Where it is not possible to invest in the cost of instruments 9 and 11, and something more convenient than the hose is desired, a carpenter's level fitted with sights, having a bubble just a little better than ordinarily comes in such a tool, and mounted on a home-made tripod, will give better results than the cheaper factory-made instruments of a corresponding price. Such an equipment ought to be fitted out at a cost not to exceed $15 for the instrument, while the cost of a suitable rod (which should be the same as for Nos. 9 and 11) would bring the total price of the outfit up to $21. Such an instrument would be more stable when set up and would stand more rough usage than any of the factory instruments tested preceding No. 9. When not in use as a surveying instrument, the level could be used as a carpenter's level.

Any of the instruments give satisfactory results in angle work for farm surveys where the boundary lines are established.

A Method of Sinking Curbed Foundation Wells Using Shields and Compressed Air with Some Notes on Chicago "Caisson" Foundations.*

A large portion of the city of Chicago is built upon an ancient swamp. At some time in the past it must have been a veritable quagmire. The mean elevation of the streets is about 15 ft. above the level of Lake Michigan. The underlying rock in the business portion of the city is found at depths of from 90 to 120 ft. below the street level. This rock outcrops at a distance of from 5 to 8 miles west of the lake shore. Immediately overlying the rock is a variable stratum of sand, gravel and boulders. This is a water bearing stratum. At many places it is only a few feet thick; at other places it reaches a depth of 15 or 20 ft. Overlying this stratum is one usually termed "hardpan." In composition it is variable, being principally a hard blue clay resembling shale, but not laminated. Frequently sand pockets and boulders are found in it, especially near the bottom of the stratum. Over the hardpan and reaching to within a few feet of the surface is a stratum of soft, plastic, homogeneous blue clay.

Very often there is no clearly defined line of demarcation between the soft blue clay and the hardpan underneath; but the former gradually merges into the latter. Except for the sand and boulders found in the hardpan, there is apparently very little difference in composition between it and the blue clay. The hardpan appears like blue clay from which all the water has been squeezed by the great pressure of the material above. The blue clay can be easily cut with the spade, while the hardpan can only be loosened by the pick or mattock. The top stratum, over the blue clay, consists of loam with yellow clay and sand in some places.

Until in recent years, all heavy foundations, such as bridge piers and abutments, and foundations for the heavier class of buildings, were placed on pile foundations. Piles from 50 to 60 ft. long were easily driven their full length through the soft blue clay with their points penetrating the hardpan underneath. This type of foundation is still used to a great extent, and will probably continue to be used for some time to come.

Many of the buildings which were built 15 years ago and earlier were placed on what were termed "spread foundations." They were sometimes called "floating foundations." These consisted of small masonry piers or pedestals under the points of support, the bases of which were widened to distribute the pressure over as great an area as possible. They were generally only carried down to a depth of 10 to 15 ft. below the surface. These small piers were frequently built of concrete in which steel I beams were laid side by side imbedded to distribute the pressure.

The pressure on the clay from foundations of this type was usually limited to about 3,000 lbs. per sq. ft., and it was expected that some settlement would take place in them. In erecting buildings on such foundations, provision was always made for a certain amount of settlement, usually not less than 6 ins., and very often as high as 18 ins., by setting the buildings a certain distance above the grade to which they were expected to ultimately settle. The problem for the engineer in this class of buildings was to distribute the weight so equally that the settlement would be uniform. This condition was very difficult to secure, and many examples of cracked walls have been the result.

Buildings placed on these spread foundations were generally limited to 6 or 7 stories in height, and as the ground space in the city became more valuable it became desirable to provide more stable foundations. With the spread foundations also it was impossible to provide much basement room, as the space was so largely taken up by the foundation piers. It was therefore desirable to provide a type of foundation that would permit of more basement room for storage purposes and for the location of power and heating plants. These necessities led to what is now termed the "caisson method."

This method consists of the sinking of circular wells to the hardpan or to the solid rock and filling them with concrete. The credit for this invention is due to Gen. William Soey-Smith, and was first employed on the Stock Exchange building, built in 1889. The word "caisson" as applied to this type of foundation is a misnomer, but it has been so extensively used in this connection that we may assume it to have become legitimate through custom.

The process of sinking these caissons is very similar to the well known method of sinking wells. The bore is lined or curbed with sections of plank 4 or 5 ft. long and usually about 3 ins. thick and 4 ins. wide. These plank are braced and held in position by circular bands of iron, one being placed near the top and one near the bottom of each section. It is customary to use tongued and grooved plank to prevent serious leaks in case much water is encountered. The several sections of plank lagging are added as the digging proceeds. The caissons are seldom made less than 4 ft. in diameter, as it is difficult for a man to work in a smaller space, and they do not often exceed 8 ft., although some have been built as large as 12 ft. in diameter.

If the foundation is carried down only into the hardpan, it is customary to enlarge the diameter of the caisson at the bottom in order to give a greater bearing area.

The caisson is usually carried down to the required depth with a uniform cross section, then one or two sections of the lagging are removed and the bell shaped form given to the lower portion. The rate of increase in the diameter should not exceed 1 ft. of increase to 1 ft. of height, or, in other words, the slope of the side should not exceed 1 ft. horizontal to 2 ft. vertical.

It is always advisable to increase the diameter at the bottom, even though the allowable pressure on the underlying material should not require it, for the increase costs but very little, and adds greatly to the stability of the entire column. A simple calculation will show that the unit pressure on the foundation is greatly diminished by this increase in area, for the area increases as the square of the diameter, while very little is added to the weight of the column. Assuming a caisson 6 ft. in diameter and 100 ft. deep with the bottom 5 ft. belled out to a diameter of 10 ft.; then we have:

Volume of caisson including the bell	110 cu. yds.
Volume of caisson without the bell	105 cu. yds.
Increase in volume	5 cu. yds
Percentage of increase in volume	5 per cent
Area of base 10 ft. in diameter	78.5 sq. ft.
Area of base 6 ft. in diameter	28.3 sq. ft.
Increase in area	50.2 sq. ft.
Percentage increase in area	178 per cent

Where the caisson is carried down to the rock, the footing is not usually enlarged. It would be much better if it could be enlarged as is done when the footing is made in the hardpan, but the dangers and difficulties are so great that it is not often undertaken. There is usually so much water encountered in the stratum overlying the rock that it is dangerous to remove any portion of the lagging for enlarging the bottom. It is very often necessary to put in the lagging in short sections near the bottom in order to prevent the caving and sloughing in of the surrounding material. A few anxious hours are generally spent by those responsible for the safety of the work when the rock is about reached, and a great sense of relief is felt when the rock is cleaned off and a few feet of concrete are placed in the bottom.

It is customary to allow about 20 tons pressure on the rock and from 5 to 7 tons on the hardpan. The pressure on the rock itself could be taken at a much higher value, in fact there is practically no limit to the pressure which might be safely put upon it, but it is the strength of the concrete to resist pressure that fixes the limit. The pressure on the hardpan might be safely put at a higher figure if we were certain as to what lay underneath. It is the possibility that there may be pockets of softer material between it and the rock that has made engineers conservative in fixing the limit of 5 to 7 tons.

After the caisson has been carried to the rock, it is filled with concrete. The iron bands supporting the lagging are removed as fast as the concrete is filled in so that it will hold the lagging in place. The removal of the iron bands is only for the purpose of saving them for use in other caissons. Sometimes the lagging is also removed a section at a time, just before filling with concrete. This method is preferable to leaving the lagging in, but it is not always practicable to remove it on account of the danger of the sides caving in. When the lagging is removed, there is a greater certainty of having all the spaces absolutely filled with concrete and a greater frictional resistance is secured between the concrete and the surrounding material. It is impossible to dig the wall so true that the lagging will fit tight against the earth at all points, and there are always more or less open spaces outside the lagging which eventually will become filled by the settlement of the earth, and this settlement is apt to extend clear to the surface and cause settlement in surrounding buildings.

The process of sinking caissons is quite a rapid one. The rate of sinking through the soft material will average from 8 to 10 ft. per day, but through the hardpan it is often not more than half that much.

The exacavated material is hoisted to the surface in buckets by a winch head or a windlass operated by a hoisting engine. A very simple method has been devised by which one hoisting engine is made to do the work for several caissons at once. A wooden tripod is erected over each caisson, to which is at-

*Abstract of paper by W. C. Armstrong, Formerly Engineer Chicago & North-Western Ry., in the Iowa Engineer for April 1919.

tached an iron sheave and winch head keyed to the same shaft. The tripods over several caissons are set over the centers of the caissons. A steel cable passing from the drum on the engine is then extended to each tripod and given one wrap around each sheave. The cable is then returned to the engine and the two ends spliced. It operates the same as an ordinary rope drive so often applied for the transmission of power. The engine is run slowly and continuously so that each winch head in the system is always revolving. A rope is attached to the bucket and given a number of wraps around the winch head, the free end of the rope being held by the man operating the bucket, and is paid out when the bucket is descending, and coiled up again when the bucket is being hoisted. It is not necessary that all the caissons in one system be in the same line, for the direction of the drive rope can be easily changed by means of snatch blocks. Frequently four lines of caissons forming a rectangle may be seen in operation at the same.

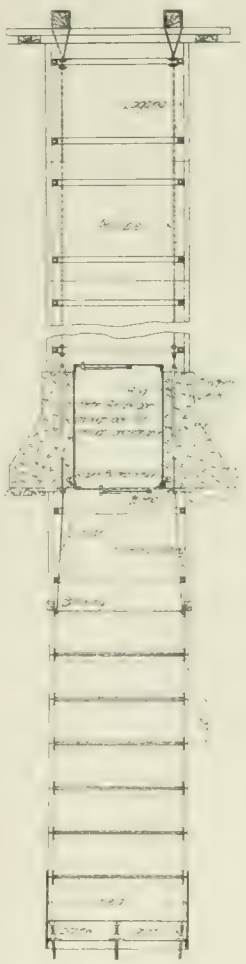
The invention of the caisson method has made possible the construction of very deep basements as well as "sky scraper" buildings. Some of the recent buildings erected in Chicago have basements reaching a depth of 50 ft. below the street. These, of course, consist of several floors below ground. The tunnels of the Illinois Tunnel Co., which traverse nearly every street in the business districts of the city, have spurs into the deeper basements, by means of which goods are delivered to and from the railroad stations, coal is delivered for the use of power plants and the ashes from same are removed; and all this traffic is constantly going on underground to the great relief of the overcongested streets.

The sinking of caissons has all been done by the open process here described, except in a few instances where air has been employed. The Northwestern Ry. Co. was the first concern to employ the use of air for this class of work. The new bascule bridge across the north branch of the Chicago river leading into the Wells street station is carried on six caissons 10 ft. in diameter, on which air was used in the operation of sinking. It is possible that they might have been sunk by the open method, but it was deemed advisable to use air as a precaution against possible accident, as there were unusual conditions to be met. The caissons were sunk in the bed of the river where there was about 12 ft. of water and several feet of soft, slimy mud in the bottom.

Air was also used in some of the caissons sunk for the foundations of the new Northwestern passenger station. These were started by the open method, and a few of them completed to the rock by that method, but much difficulty was encountered after reaching the gravel and boulders over the rock. There was a large amount of quicksand in this stratum and so much water flowed in that it was found impracticable to keep it baled out so that progress could be made with the digging. The flow of water carried in such quantities of sand that it was feared large pockets would be formed outside of the caisson which would lead to dangerous settlements of the surrounding material. The use of air was therefore resorted to. The airlock was placed in the hardpan stratum as far below the surface as possible. The caisson was enlarged at this point, and the lock sealed in a collar of concrete. A sectional view of this construction is shown in Fig. 1.

A circular shield 5 ft. long and made of ⅜-in. steel plate was inserted below the lock. Around the cutting edge of this shield an angle was riveted as shown in the sketch. The lagging to be used was made up in sections about 2 ft. long. It was composed of tongued and grooved plank to which were bolted circular angle bands at the top and bottom. The joints in the plank were caulked with oakum and tar and made as nearly air tight as possible. The sections of lagging were made of the proper diameter to fit closely the inside diameter of the shield. Between the bottom angle of the lagging and the angle around the cutting edge of the shield, jackscrews were placed for forcing the shield downward. Whenever the shield was forced down far enough, and the material was excavated the jacks were removed and another section of lagging was put in place. The top angle of the lower section of lagging was bolted to the bottom angle of the upper section after a rubber gasket had been inserted between them to prevent the escape of air.

However, with all the precautions taken to prevent the escape of air, it was found that it did escape quite rapidly. Part of it escaped through the sections of lagging, some escaped through the joints between the lagging and the shield, and a great deal escaped through the gravel and boulder stratum through which the caisson was being sunk. After considerable experimenting, it was found that the escape of air through the lagging and the shield could best be prevented by plastering with mud. For this purpose the soft blue clay found above the hardpan proved very efficient. The loss of air through the gravel and boulders could not be prevented and the only way



Sketch Showing Method of Sinking Curbed Foundation Well With Shield and Compressed Air.

to overcome this loss was by forcing in a greater supply of air. Eighty-eight caissons under the station building were sunk by this method, and four supporting the chimney for the power house.

The cost of caissons sunk by the open process will vary from $10 to $20 per cu. yd. Caissons founded in the hardpan can usually be completed for $10 per cu. yd., while those carried to the rock will vary more in cost, depending upon the difficulties met with. The cost of the concrete may be regarded as the constant factor in the total cost, and is usually somewhat less than half the total, while the cost of excavating is the variable factor. Where air is used the cost is subject to greater variations and is so contingent upon the conditions met with in the excavation of the work that no reliable figure can be given. Generally it will be about double the cost of excavation.

The novel method of shaft sinking referred to by Mr. Armstrong is further described in the following data collected by one of the editors.

At the work on the Chicago & Northwestern Ry. Terminal station, the first group of six caissons was excavated in the ordinary manner and it was found that on account of the difficulty with water and sand in the lower strata, another method would have to be used. Accordingly, Geo. A. Fuller Co., the General Contractors for the erection of the station, let a sub-contract to The Foundation Co. of Chicago, to excavate the lower part of the caissons and place concrete in them up to a point above the water-bearing stratum. The point at which The Foundation Co. took the work was about 70 to 80 ft. below street level and the work was carried to rock, which was from 106 to 116 ft. below the street. This part of the work was carried on under air pressure.

Provisions were made in each caisson to start the work under air pressure before the excavation had reached the bottom of the hard-pan. A collapsible steel air lock was hung in the caisson 5 or 6 ft. from the bottom and concreted in. The lock was 4½ ft. in diameter and 5½ ft. long, and was fitted with doors of the Moran type. The air pipe was passed through the lock and not through the concrete. Arrangement was also made to pass the wire cable through stuffing boxes in the lock and thus it was possible to leave the cable attached to the bucket. With the lock in position a shield was placed directly under it and the excavation continued without air pressure until water bearing strata were reached. The lock was then closed and as much air pressure turned on as was required to hold back the water.

The shield used was 4 ft. long and slightly larger in diameter than the bottom of the footing. It was made of steel plates in four vertical sections, which were arranged to be joined on the inside. An angle, bent to fit the circle, was riveted to the inside at the bottom of the shield. This was used to provide a footing for the four 10-ton screw jacks which were placed between the angle and the lagging above. Below the air lock the lagging used was 2 ins. thick, tongued-and-grooved, and in 3 ft. lengths. When the shield had advanced 3 ft. another section of wooden lagging was placed and the bottom of the preceding lagging still overlapped the shield 6 or 8 ins. This provided a seal between the shield and lagging and caving was thus prevented. A set of iron hoops, ¾x3 ins., were used to brace the lagging above the airlock, but below it angles were used. This lagging was assembled in sections before lowering into the caisson. The sections were made to comprise one-fourth of the circle and the angles arranged so as to be bolted to the angles on the adjacent sections.

When the shield was set firmly on rock at the bottom of the caissons, the bolts in the angle near the cutting edge were removed so that the angle was recovered. The concrete was then deposited in the bottom and carried up to the next angle which was also removed and saved for future use. The lagging was thus left in place and braced at all times either by the angles or the concrete.

After the concrete was placed as far as the lock the latter was collapsed by removing a key in one of the joints between the two longitudinal sections which composed it, and the lock was removed. Following this the balance of the concrete was dumped into the open caisson directly from the surface. The amount of drop thus secured produced satisfactory results without requiring tamping and without separating the aggregate.

The plant used to supply air consisted of three Ingersoll-Rand duplex air compressors, each with a capacity of 1,200 cu. ft. of free air per minute when operating against a 25-lb. pressure.

Four 125 hp. boilers were used to supply steam and were usually operated at their full capacity. Even with this output of 3,600 cu. ft. of free air per minute it sometimes was possible to supply enough air to operate only six caissons at a time. This was due to encountering clean, loose gravel in the caissons through which the air passed readily. It was found that the air passed out from the cais-

sons through these water-bearing strata, following along under the deep bed of clay until it reached a point where an opening had been made through the clay to the upper surface. These points, of course, were wherever another caisson had been completed and the air found its way up alongside the lagging which was left in place.

The progress made on the work by The Foundation Co. averaged about six completed caissons a day. An average of 12 gangs of men were kept at work in 3 shifts of 8 hours. Each gang consisted of from 1 to 3 men in the bottom, according to the diameter of the caisson; 1 man in the air lock and 2 men at the top.

We are indebted to Mr. Frederick W. Adgate, Western Manager of The Foundation Co. for the above drawing, illustrating the method used.

Road Repairs and Maintenance Work of the Metropolitan Park Commission of Massachusetts in 1909.

During 1909 the Engineering Department of the Metropolitan Park Commission of Massachusetts continued the use of tars and oils for road repairs and road treatments. The material used for this work were the same as used in previous years, heavy asphaltic oils being used upon the gravel surfaced roads and on some macadam, and refined tars and residual asphalts upon the greater portion of the macadam road surfaces.

Calcium chloride solution was used on some of the roadways which are not subjected to heavy automobile traffic, or where they are used to a large extent by pedestrians, as at Nantasket and Nahant Beaches and in the woods reservations. In the selection of the material to be used on the various roadways the kind of roadway surfaces and the existing traffic conditions were considered, and that material used which seemed to be best adapted to these conditions.

The type of roadway surfacing generally used during 1909 for new construction work has differed from that previously used, and consists of a crushed stone base of a thickness of 4 ins., with a gravel top or wearing surface from 2 to 3 ins. in thickness, thoroughly saturated with heavy asphaltic oil.

A summary of the cost of the road repairs and maintenance work is given in the accompanying table, the data being rearranged from the recently issued report of the Commission.

The following will explain more fully the various classes of work noted in the table:

By surface treatment is meant the application of refined tars, asphaltic oils or calcium chloride to the surfaces of roadways which are in good condition, for their preservation and for the suppression of the dust. Usually it is necessary only to clean the roadway before treating, and give a light dressing of crushed stone screenings, sand or gravel after treating.

By resurfacing it is meant that a macadam or gravel surfaced road which has become badly worn is loosened up on the surface to a depth of about 3 in., by the use of a scarifier. The surface is then reshaped and from 2 to 3 ins. of new material added, and the road rolled and treated with bituminous binder in the same manner as in new construction work.

By construction it is meant that an old earth roadway is excavated to subgrade sometimes with changes in the line of grade, and a new surface of crushed stone or gravel or a combination of both is constructed thereon. The depth of the surfacing material is generally about 6 ins.

All of the Engineering work of the Metropolitan Park Commission is done under the direction of John R. Rablin.

Cost of Gravel Surfacing with Traction Outfit.—The greater part of the roads in the town of Glenville, N. Y., are surfaced with pit gravel, the town doing the work with a traction engine outfit. In the following cost data, covering a period of years, no account is made of the value of gravel. The outfit consists of a traction engine, four 5 cu. yd. cars, bin and conveyors. It cost $3,250. The average yearly repair bill has been $50 per year, and the average cost of working per day without the bin has been $10. The average cost of working per day with bin has been $16. When using the elevator and bins nearly double the yardage per day has been moved. The average cost per cubic yard of gravel placed on road (three mile haul) has been 42 cts.; for a one mile haul the cost has been 20 cts. per cubic yard and in some cases the cost has been as low as 15 cts. per cubic yard. The cost of surfacing one mile of road with 4 ins. of gravel (three mile haul) has been $350 to $400 per mile. The cost of surfacing one mile of road with 4 ins. of gravel (one mile haul) has been $225 to $300 per mile. The labor required is as follows:

	Per day.
One engineer	$3.00
One helper	1.75
2 laborers, at $1.50	3.00
When using bin, one team	4.00

SUMMARY OF COST OF ROAD REPAIRS AND MAINTENANCE IN 1909 BY THE METROPOLITAN PARK COMMISSION OF MASSACHUSETTS.

	Length, ft.	Width roadway, ft.	Sq. yds.	Kind of binder or dust layer.	Labor cost, cents.	Gravel, cents.	Broken stone, cents	Sand, cents.	Binder or dust layer, cents.	Total, cents per sq. yd.

Personals.

Mr. E. B. Parsons has been re-elected City Engineer of Oconomowoc, Wis.

Rear Admiral Philip Hichborn (retired), chief constructor of U. S. Navy from 1893 until his retirement in 1901, died May 1 after a long illness. He was 71 years old.

Charles R. Clow, vice-president of the firm of James Clow & Sons, large dealers in plumbers' and water works supplies and machinery, died in Chicago, Ill., on May 7, 1910, of cerebral hemorrhage. He was born at Pittsburg, Pa., March 22, 1865.

Mr. Walter Irvine Schlichter has been appointed Professor of Electrical Engineering at Columbia University. Prof. Schlichter was graduated from Columbia in 1896 and has for a number of years been with the General Electric Co. at Schenectady, N. Y.

Charles F. Foster, Mechanical Engineer, died suddenly May 7 at his residence in Chicago, Ill. Mr. Foster was the chief mechanical engineer of the Columbian Exposition and filled similar positions at the Atlanta and St. Louis expositions. He was engaged in general engineerng business at the time of his death.

William Storrs MacHarg, M. Am. Soc. C. E., died at Chicago, Ill., on May 6, 1910, of heart disease and parlysis. Until his final illness Mr. MacHarg had been a consulting engineer in charge of the intercepting sewer system of Chicago. He had charge of the sewerage and water supply systems and the fire protection system for the World's Columbian Exposition and was well known for his work in similar lines throughout the west. Mr. MacHarg was born at Albion, N. Y., Nov. 18, 1867.

Governor Deneen of Illinois has appointed the following commission to establish fire fighting and rescue stations in coal fields in Illinois, as provided in an enactment at the special session of the legislature. The commission, composed of two operators, two members of the miners' union, a state mine inspector, a representative of the University of Illinois and a representative of the federal government, follows: J. W. Miller, Gillespie; John L. Schmidgall, Murphysboro, operators; Charles Krallman, Glen Carbon; Charles Bennett, La Salle, miners; Hector McAllister, Streator, state mine inspector; Prof. H. H. Stoek of the State University; Dr. J. A. Holmes of the Geological Survey, Washington, D. C.

Mr. A. W. Thompson, Chief Engineer of the Baltimore & Ohio R. R., has announced the following changes in the engineering organization: Mr. John T. Wilson, former assistant engineer at Baltimore, has been promoted to district engineer, with jurisdiction between Philadelphia and the Ohio river at Parkersburg and Wheeling, with headquarters in Baltimore. Mr. R. N Begien, former division engineer of the Philadelphia division, has been appointed assistant to the chief engineer, with offices at Baltimore, and will be succeeded by Mr. E. T. Brown, former division engineer of the Shenandoah division. Mr. G. T. Warren becomes division engineer of the Shenandoah division at Winchester, Va., succeeding Mr. Brown.

John H. Converse, President of the Baldwin Locomotive Works, died suddenly May 3, at his suburban home at Rosemont, near Philadelphia, Pa., of heart disease. Mr. Converse was born in Burlington, Vt., in 1840, and was graduated from the University of Vermont in 1861. For the first three years after leaving college Mr. Converse was engaged in journalism. In 1864 he came to Chicago and secured a position in the general manager's office of the Chicago & Northwestern Ry. Two years later he removed to Altoona, Pa., becoming an assistant to Edward H. Williams, then general superintendent of the Pennsylvania R. R. When in 1870 Mr. Williams purchased an interest in the Baldwin Locomotive Works, Mr. Converse went with him, and three years later became a member of the firm. The entire remainder of Mr. Converse's business life was devoted to this establishment, and for nearly the whole time he was its administrative head.

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING-CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

ROAD AND STREETS.

Retrospective and Suggestive. By Wm Weaver, Surveyor, Apr. 22, 1910; 1 p.

The author points to the difficulty which confronts the engineer in providing a road suitable alike for motor and horse traffic. He advises the more extensive use of destructor material for road work, especially in towns.

The Roads Question.—By H. T. Wakelam, Surveyor, Apr. 22, 1910; 2 pp.

The author gives some little data on the use of bituminous materials in road construction and improvement. An interesting feature of the article is a table showing the total percentages of annual increase of maintenance expenditures in various counties in England during 10 years.

Tar-Macadam: A Plea for Standardization.—By J. Walker Smith, Surveyor, Apr. 22, 1910; 5 pp.

The author takes it as an axiom that tar in some form is destined to play an important part in the road construction of the future. He deals in much detail with the two main methods of construction by pitch macadam and tar concrete or ordinary mixed tar macadam. An interesting feature of the article is a description of the elaborate mixing installation which the author proposes to install for Edinburg. Another valuable feature of this article is the specifications favored by Mr. Smith for bituminous bound roads. This is a valuable article by the author of "Dustless Roads" and the article is practically a supplementary chapter to that book.

A Word on the Carriageway.—By Henry E. Stilgoe, Surveyor, Apr. 22, 1910; 3 pp.

The writer of this article emphasizes the essential importance of good foundations in roadwork. The comparative economy of road materials is considered both as regards first cost and average life, and the conditions which justify the substitution of the paved road for the macadamized one, are discussed. The article includes a table showing the comparative cost of constructing and maintaining 10,000 sq. yds. of carriageway paved with granite and wood blocks on streets with heavy traffic.

Tarring.—By R. J. Thomas, Surveyor, Apr. 22, 1910; 1½ pp.

The article gives detail of cost of sweeping off dust and tarring surfaces during three months treatment of rural main roads. The work was done by eight gangs each, using a 50 or 80 gallon portable side fired boiler. The general instructions under which the tar painting was done are included.

Convex, Concave and Center-Channel Roads.—By Harold G. Turner, Surveyor, Apr. 22, 1910; 2½ pp.

The article contains a comprehensive list of the arguments which may be urged for and against the adoption of concave section for roads as compared with the center-channel roads or the usual convex form. The question is considered as regards initial cost, cost of upkeep, sanitation and utility possibilities and general considerations.

Wood Paving.—By James P. Norrington, Surveyor, Apr. 15, 1910; 1 pp.

The author describes various kinds of wood block paving and gives data as to life. He concludes that all paving should be laid diagonally, that the concrete should be 9 in. thick and that creosoted deal is preferable.

The Highway System of Los Angeles County, California.—By Prof. A. Hood, Mun. Eng. Mag., 7 pp.

Los Angeles county is spending $3,000,000 for the construction of 307 miles of highways. This article is a general description of the work being done.

Specifications for Cresote Oil.—Mun. Eng. Mag., May, 1910; 4 pp.

A report to a committee regarding specifications for creosote oil. Contains a fairly complete compilation of the various specifications for creosote oil and its use for wood preservation.

Road Maintenance in Cheltenham.—By J. S. Pickering, Surveyor, Apr. 15, 1910; 1 p.

Describes the methods of highway maintenance in the residential English town of Cheltenham. A new method of tar construction which the author has used with success is described.

Modern Conditions Affecting the Road Engineer.—By W. H. Maxwell, Surveyor, Apr. 15, 1910; 2½ pp.

The author deals with the increase and change in character which have taken place in traffic in recent years and points out the variety of conditions which the engineer has to meet. The selection of road materials and "half width" repair are discussed and the advantages and disadvantages of tar macadam are given and the process of tar painting dealt with. Attention is called to dampness as a fatal obstacle to successful tar painting. Road signs, mile stones and guide posts are also considered.

Dust Palliatives, Random Setts and Tarmac.—By C. J. Mason, Surveyor, Apr. 15, 1910; 1 p.

The following points are brought out in this article: The need for diverting fast motor traffic from existing highways; the economy in watering effected by the spraying; and the efficiency of random setts and slag tarmac.

On the Need for a State Highway Authority and Office of Record.—By E. J. Lovegrove, Surveyor, Apr. 15, 1910; 1½ pp.

The author advocates the establishment of an English state department to deal primarily with trunk roads and national grants in aid for roads maintenance and improvement. He further advocates the establishment of a state highway laboratory and emphasizes the need for standardization of road materials.

Tramway Margins.—By J. S. Killick, Surveyor, Apr. 15, 1910, 1 p.

The author discusses the difficulties connected with the maintenance of tramway margins and particularly of the joint between a paved track and a macadam road. H also discusses the causes of the disintegration of the macadam margin, and points out objects to the whole roadway being paved with granite pitchings.

Tramway Track Maintenance and Renewal.—By Henry Mattinson, Surveyor, Apr. 15, 1910; 4 pp.

The article treats of the causes of deterioration of tramway tracks particularly in regard to damage by way, and gives methods by which such damage may best be prevented. Observations are also given in regard to "anchoring" "swinging rails." The subjects of loose joints and welding are discussed and the matter of the wear of rails is treated. The author also considers special track work, repairs, renewals and track reconstruction.

Notes on Every-Day Highway Construction and Maintenance.—By Geo. G. Manning, Surveyor, Apr. 15, 1910; 1 p.

The author describes his experience with tar construction and calls attention to the importance of local conditions as factors which must determine the materials or methods to be adopted for the maintenance of highway surfaces.

The Use of Tar on Roads.—By W. J. Atkinson, Surveyor, Apr. 15, 1910; 2 pp.

This article deals with the properties of tars as regards their suitability for road work and discusses the relative importance of the chemical and physical properties. The author expresses the view that tar is best employed in the surface layer of the road only, and emphasizes the need for a good foundation.

Modern Road Repairs.—By E. Purnell Hooley, Surveyor, Apr. 15, 1910; 2 pp.

The author compares water bound and waterproof roads as regards their wearing qualities and discusses the important effect of the weather upon road surfaces. The method of constructing a tarmac road is considered in some little detail.

Roads and Vehicles.—By Col. R. E. Crompton, Surveyor, Apr. 15, 1910.

The author discusses the future of road engineering from the point of view of an engineer responsible for the construction and maintenance both of the roads and of the vehicles which use them. He first deals with the difficulties and importance of studying the improvement of modern road and in uncertain weather, and then proceeds to a consideration of the effect of the vehicles, both fast and heavy, on the roads as governed by the nature of their wheels. He reaches the conclusion that the solution of the modern road problem lies in impervious construction of road surfaces combined with improvements in wheel construction by which impact shocks and other evils may be reduced.

Somes Notes on Traffic and Road Maintenance.—By A. Dryland, Surveyor, Apr. 15, 1910; 2 pp.

The author calls attention to the enormous increase in traffic in late years, both as regards weight and speed, and describes the effect of this new traffic. As remedial measures he suggests wood paving tar macadam and tar painting.

The Dimensions of Roads and Streets.—By H. Percy Boulnois, Surveyor, Apr. 15, 1910; 2½ pp.

The author takes exception to the present accepted English standard for relative widths of footways and roadways and presents figures to substantiate his contention. The article also contains some interesting remarks on certain resolutions of the Paris Road Congress, by laws as to the width of streets, the width of vehicles, the "rule of the road," gradients and camber.

Road Construction and Maintenance.—By John S. Brodie, Surveyor, Apr. 15; 1 p.

The article treats of the more important aspects of road construction, and includes short specifications of standardized types of street construction which the author has designed as the result of his experience.

Irish Roads: Construction, Maintenance and Administration. Surveyor, Apr. 15, 1910, 4 pp.

This article has been prepared from answers given by practically all of the County Surveyors of Ireland to questions addressed to them in 1907. The matters dealt with cover the whole field of road construction, maintenance and administration as regards Ireland. The complete list of answers in pamphlet form, entitled "Irish Roads," can be obtained from the Sackville Press, Findlater Pl., Dublin, Ireland, for 15 cts. with postage added.

Some Notes on Highway Law.—By Sydney G. Turner, Surveyor, Apr. 22, 1910; 2½ pp.

The author discusses first, the definition of a "Highway" and the extent of the right of the public over a way which has been dedicated. He then deals with the various ways in which highways may be created and what is involved in the dedication. He also considers the liability to repair the main roads and gives some notes on nuisance to highways and on the question of extraordinary traffic.

Road Crust Construction.—By Jos. Mathison, Surveyor, Apr. 22, 1910; 2½ pp.

The author writes of his experience with a four years trial of Ferromac in road construction. Some data on the cost of the work are given.

Public Roads and Vicinal Railways.—By R. O. Wynne-Roberts, Surveyor, Apr. 15, 1910; 5½ pp.

This author endeavors to show in this article how narrow railways on public roads connecting neighboring towns could promote the development of rural districts, result in the improvement of highways and assist the road authorities.

Average Unit Prices and Some Details of Pavements Constructed in 1909 in a Number of Representative American Cities.—Eng.-Contg., April 6 and 13, 1910; 4¼ pp.

Tables giving amount, price and general structural characteristics of stone block, macadam, bitulithic, asphalt, creosoted wood block and brick pavement laid in some 30 to 50 representative cities of the United States. A table is also given showing amount and cost of all pavement laid and amount of paving planned for coming year in about 150 cities.

Experimental Work of the New York State Highway Commission in 1909 with Glutrin and with Resurfacing with Bituminous Macadam and Asphalt Macadam.—Eng.-Contg., Apr. 13, 1910; 2½ pp.

Describes methods of making the treatment with figures of amounts of materials required, rates of work, etc., and in particular gives itemized costs of a number of examples of resurfacing work. A notably valuable article.

Methods of Constructing Sand Clay Roads in the Middle West and Cost Data on the Construction of Four Roads of This Type.—Eng.-Contg., Apr. 20, 1910; 3½ pp.

General methods of construction are described under headings: Sand clay construction in the gumbo or plastic soil sections, use of sand clay on sand hill roads, improving loam and alkali soil roads, and sand oil coverings for sand clay

roads. Four specific examples of sand clay road construction are given with itemized unit costs of the work.

Test of Street Flushing or Washing Machines, Department of Street Cleaning, New York City.—Eng. News, Apr. 14, 1910; 1¼ pp.

Describes machines tested, methods of making tests and gives conclusions from results. Tables are given summarizing in various ways according to different units the results obtained. These data are valuable.

Preservatives for Wood Paving Blocks.—Eng. Rec., Apr. 16, 1910; ¾ p.

A discussion with comparative figures of the relative value of creosote oil and tar for preserving wood blocks for paving. Argument tends to show the avoidability of the cheaper tar compounds.

Construction of Sand-Clay and Earth Roads.—Contr., April 15, 1910. 4 pp.

Condensed from a circular prepared by W. L. Spoon, Superintendent of Road Construction. Contains summaries of costs.

SEWERS.

Construction Methods of the Louisville Sewerage Work.—Eng. Rec., Apr. 2, 1910; 1¾ pp.

A general summary of the construction methods being employed for these large size concrete sewers.

Sewage Disposal Ideals.—Eng. Rec., Apr. 9, 1910; 2¾ pp.

A general discussion of the ideal conditions and methods of sewerage disposal.

A Notable British Court Decision Regarding Stream Pollution by Birmingham Sewerage Works.—Eng. News, Apr. 21, 1910; 1 5/6 pp.

Decision in a suit to dissolve an injunction against the sewage of Birmingham being discharged into the River Tame. Conclusion was that owing to the effluent being better than the river water the river water is improved rather than injured.

Sewage Disposal Works at Indiana, Pa.—Eng. Rec., Apr. 30, 1910; 1½ pp.

Describes sewage disposal works comprising screening and grit chambers, two sludge tanks, closing tank and coke chamber, sprinkling filters, settling tanks and sludge pond for a city of 8,000 population. General plans of sprinkling filter are given.

The Sewage Disposal Plant at Roebling.—Eng. Rec., April 9, 1910; 3⅓ pp.

General description with plans of a sewage disposal plant comprising screening and sedimentation chambers, primary and secondary contact beds and sand fillers for an industrial town of 2,000 population.

Sewage Disposal at Birmingham and Salisbury, England.—Eng. Rec., Apr. 16, 1910, 1⅔ pp.

Describes briefly the general characteristics and conditions of operation of the sewage disposal works for the cities named.

Constructing Concrete Sewers in Open Trench.—Eng. Rec., April 16, 1910; 1 p.

General description of methods of constructing some 2,600 ft. of 3⅓ to 10½ x 14 ft. concrete sewers.

Constructing a Large Brick-Lined Sewer Tunnel, Brooklyn, N. Y.—Eng. Rec., April 9, 1910; 1¾ pp.

Describes and illustrates method of constructing 2,000 ft. of 11½ ft. brick sewer in tunnel by the Mees system. A useful article.

Sewage Disposal Plant at Independence, Kans. By A. A. Stivers. Cem. Rec., April, 1910. 1 pp.

A description, accompanied by the plans, of the concrete septic tank and filter beds. The costs of construction are given.

WATERWORKS AND HYDRAULICS.

Water Supply in India.—By Percy G. Scott, Surveyor, Apr. 8, 1910; 3 pp.

An abstract of a paper read before the English Society of Engineers. In it the author describes the methods of designing and constructing the water supply scheme for Moulmein, one of the principal ports of Burma, a city of 60,000 people. The supply is obtained from a storage reservoir and is brought to the city by gravity. The article is interesting inasmuch as it describes the methods adopted in the construction of water works in a tropical country.

Construction of the Belle Fourche Dam.—Eng. Rec., Apr. 2, 1910; 3⅔ pp.

Gives map of work and layout of construction plant and services and sections and profile of this large earth dam. A general description of the methods of construction and of the construction plant accompanies the illustrations.

Sand Filters and Disease Germs.—By Rudolph Hering. Min. Jl. & Eng., Apr. 27, 1910; 2 pp.

An article dealing with efficiency of sand filters, water purification in removing pathogenic bacteria. The author states that there appears to be sufficient evidence that with a sufficient quantity of nutriment dissolved in the water pathogenic bacteria not only pass through sand filters, but their number may also actually increase within them. Numerous references are cited to bear out this statement.

Water Purification at Columbus.—May 4, 1910; 4 pp.

A description of the 30,000,000 gal. plant at Columbus, O. The water purification combines softening and filtration by mechanical or rapid filters. The article is taken from a paper by John H. Gregory read before the American Society of Civil Engineers.

Sterilization of Water.—By Walden & Powell. Mun. Eng. Mag., May, 1910; 5 pp.

An interesting article regarding the sterilization of water by ozone. It also contains much information regarding the action of hypochlorite of calcium upon raw water. The matter is taken from a paper read before the American Water Works Association.

The Ground Arch in Filter and Covered Reservoir Construction.—Eng.-Contg., April 6, 1910; 7⅔ pp.

A very complete discussion of the design of ground arch roofs with comparisons of economy and statistics on the ground arch reservoir and filter roofs and floors constructed in the United States. The most complete paper in print on its subject. Same, Eng. News, Apr. 7, 1910, 5¾ pp.

A Novel Method of Placing Cast Iron Wells in a Water-Works Crib.—Eng.-Contg., Apr. 13, 1910; 3¾ pp.

Describes and illustrates the structural features and methods of construction and itemizes the trim changes for each feature of the construction work. A record of an ingenious method of sinking cast-iron cylinder wells.

Designs and Contract for Rebuilding the Colorado River Dam at Austin, Texas.—Eng. News, Apr. 14, 1910; 2¾ pp.

Describes briefly feature of original dam and gives plans and portions of specifications for the proposed new dam.

The Chances of Pollution in Shallow Wells for Municipal Water-Supply.—Eng. News, Apr. 21, 1910; ¾ p.

Gives results of investigations made in several cities to determine what chance there was of water pollution in wells from infiltration of impurities from nearby sources of various characters.

The Production and Utilization of Ozone, with Especial Reference to Water Purification. Eng. News, Apr. 28, 1910. 8¼ pp.

A notably complete historical and descriptive article on systems of water purification by ozone. The various foreign and American ozone systems are described, with illustrations of plant used. A 1½-page editorial discusses the possibilities and probabilities of the system.

A 10,000,000-Gal. Pressure Mechanical Water-Filtration Plant at Duke's Farm, Somerville, N. J.—Eng. News, Apr. 14, 1910; 1 p.

Shows cross-section and gives general description of the plant.

The Slow Sand Water Filters Under Construction at Reading, Pa.—Eng. News, Apr. 14, 1910; 3¾ pp.

Gives general plans and special details and a full general description of the conditions, the old and new filters and the general methods of construction. Several structural departures from previous practice are described. A notable feature is the very complete drawings of the forms used for constructing the vaulted roof.

Experiments with Hypochlorite of Lime as a Water Disinfectant, at Hartford, Conn.—Eng. News, Apr. 7, 1910; ¾ p.

Describes methods of making experiments and gives results of bacterial analysis of raw and treated water, and showing percentage of reduction of bacteria by disinfection.

JOHN WILEY & SONS

43 and 45 East 19th Street

NEW YORK CITY

London: CHAPMAN & HALL, Ltd. Montreal, Can.: RENOUF PUB. CO.

"Modern Location of Standard Turnouts"

By C. M. KURTZ, of the Construction Dept., S. P. Co. Solves the track engineering and switch problems always looked for but never found in other field books.

"This is a novelty whose value all locating engineers will appreciate."—Eng. News, March 17, 1910.

Flexible leather; 4x6¾ in.; 51 pp., 23 figs. Postpaid $1.25

236 Iowa Street, SAN FRANCISCO, CAL.

FINANCING AN ENTERPRISE

Practical two vol. work by Francis Cooper telling how to secure capital and successfully promote a business enterprise. Prospectus writing, patents, capitalization, incorporation. Written from 15 years' promoting experience. Third ed. 543 pp. $4 prepaid. Circular on request.

Ronald Press Co., 229X Broadway, New York

Tables for Calculating Sizes of Steam Pipes

By ISAAC CHAIMOVITSCH, M. E.

Manual. Shows how to determine pipe sizes for low-pressure heating.

Bound in Cloth; 4½x6¾ in.; 47 pp. Postpaid, $2.00.

Prof. R. C. Carpenter, Cornell University:

"I am much pleased with this book and think it should prove useful to Heating Engineers."

Table for Losses of Pressure for the Different Coefficients of Friction

50 Cents Postpaid.

2134 Haddon Avenue CHICAGO

Wachusett Reservoir; Metropolitan Water-Works, Boston, Mass.—Eng. News, Apr. 14, 1910; 4 pp.

Describes general scheme of reforestation, methods of seed planting, transplanting, field planting, etc., with costs of the various items of the work.

Hypochlorite of Lime as an Adjunct to Mechanical Water Filtration at Quincy, Ill.—Eng. News, Apr. 7, 1910; ½ p.

Describes and gives results of tests of water to determine efficiency of treatment with hypochlorite of lime.

The Use of Hypochlorite of Lime in Connection with the Mechanical-Filtration Plant of Harrisburg, Pa.—Eng. News, Apr. 7, 1910; 1 p.

Outlines character of plant; gives methods employed in the use of hypochlorite and results obtained; presents conclusions and remarks on the general operation of the plant.

The Use of Hypochlorite of Lime to Disinfect the Water-Supply of Montreal, P. Q.—Eng. News, Apr. 7, 1910; 1¼ pp.

Illustrates and describes plant, and gives results of treatment and figures on quantities and costs of chemicals used.

A 20,000,000-Gal. Hypochlorite Water-Disinfecting Plant at Minneapolis, Minn.—Eng. News, Apr. 7, 1910; 1¼ pp.

Gives plans and general description of plant and presents table showing presence and absence of colon bacilli before and after treatment.

The Use of Sulphate of Alumina and Hypochlorite of Lime in the Storage and Distributing Reservoir of the Nashville Water-Works.—Eng. News, Apr. 7, 1910; ⅔ pp.

Outlines methods of application of the chemicals and gives analysis showing results obtained.

Some Los Angeles Aqueduct Costs.—Eng. News, Apr. 28, 1910; ⅔ p.

Gives some general costs on excavation of Elizabeth tunnel and makes comparison of day labor costs and contract prices for certain sections of the work.

Development of the Ninety-Nine Islands Station of the Southern Power Company.—Eng. Rec., Apr. 2, 1910, 5½ pp.

General description, with illustrations of main structural features of this plant; itemizes main parts of construction plant and illustrates plant lay-out and describes very generally the methods of work. The drawings and views of plant arrangement are of most value.

Failure of a Reinforced Concrete Reservoir.—Eng. Rec., Apr. 23, 1910; ¾ p.

Describes the failure of a circular reinforced concrete reservoir 41 ft. deep and 41 ft. in diameter and the results of investigations to determine the cause of the accident.

Concerning the Corrosion of Metals by Water.—Eng. Rec., Apr. 23, 1910; 2 pp.

An excellent presentation of the problem of corrosion of metals by water and of the various factors that enter into the solution of the problem and the necessity of their further study.

Water Purification and Pumping Plant at New Orleans, La.—Eng. Rec., Apr. 23, 1910; 5 pp.

A general description with plan of the plant named, under the headings of pumping plant, buildings, water purification plant, intake and suction line, pumping station, head house, grit reservoirs, lime mixing reservoirs, filters and clear water reservoirs.

An Earth Reservoir at Ogden, Utah.—Eng. Rec., Apr. 16, 1910; 1¼ pp.

Describes general construction of an earth reservoir 237x260 ft., with general account of structural features.

A Hydroelectric Development of the Weber River, Utah.—Eng. Rec., Apr. 2, 1910; 4 pp.

Principally of value for description and illustration of structural features and general methods of construction of wood stave and reinforced concrete pipe line.

The Hunters Brook Tunnel Construction.—Eng. Rec., Apr. 2, 1910; 1½ pp.

Describes plant employed and general methods being followed in driving two tunnels, one 6,150 ft. long.

The Wallkill Pressure Tunnel of the Catskill Aqueduct.—Eng. Rec., Apr. 2, 1910; 4⅔ pp.

Describes main structural features of 11-mile tunnel 14½ ft. in diameter. Geneology of

NOW READY! NOW READY!

Second Edition

of

Gillette's "Cost Data"

(1900 pages)

The second, or 1910, edition of Gillette's "Handbook of Cost Data" is now off the press. This edition contains 4½ times as much data as the first edition contained. A slightly smaller size of type and a slightly larger type page have been used in this second edition, so that one page of the second edition is equivalent to one and a half pages of the first edition. This, taken with the very great increase in the number of pages, makes the 1910 edition of Gillette's "Handbook" the largest technical "pocketbook" published in America. As a reference book on *methods* of construction of all classes of engineering works, it merits a place in every engineer's or contractor's library. As a reference book on detailed *costs* it is obviously invaluable. The unprecedented sale of the first edition clearly demonstrated that fact.

That the owners of copies of the first edition may clearly appreciate the very great increase in the amount of data in the second edition, we give the following table:

		Pages.
I	Principles of Engineering Economics	118
II	Earth Excavation	52
III	Rock Excavation	87
IV	Roads and Streets	217
V	Stone Masonry	55
VI	Concrete	110
VII	Waterworks	161
VIII	Sewers	143
IX	Timberwork	124
X	Buildings	54
XI	Railways (Steam and Electric)	348
XII	Bridges	246
XIII	Steel Work (Not given in other sections)	29
XIV	Engineering and Surveys	34
XV	Miscellaneous Cost Data.	63
	Total Text	1,841

This is exclusive of tables of contents and index, which bring the grand total up to nearly 1,900 pages. Remember that this is equivalent to 2,800 pages of the size used in the first edition, and you will better appreciate the truly enormous increase in amount of cost data.

The Price of the Book is $5.00 net, postpaid

HEIDENREICH'S "POCKETBOOK"

The large sale of this Pocketbook for designers of reinforced concrete demonstrates again the fact that the true merit of any book soon becomes generally known. As a labor saver Heidenreich's Pocketbook is directly comparable with the best pocketbooks on structural steel work. Its tables are very complete. The book is leather bound, 374 pages, and its price is $3.00 net, postpaid.

The Myron C. Clark Publishing Co.
355 Dearborn Street, Chicago
13-21 Park Row, New York

rock penetrated is given and methods of work are described generally and in some detail in respect to shaft sinking, concerning which many useful data are given.

Submerged Pipe Line from Jersey City to Ellis Island.—Eng. Rec., Apr. 2, 1910; ⅔ p.

Describes general methods employed in laying a submerged 8-in. cast-iron pipe line 2,100 ft. long.

The Lock Leven Power Plant.—Can. Engr., April 15, 1910. 3¾ pp.

A description of an hydro-electric development at Kinlockleven, Argyleshire, Scotland. 30,000 h.p. is developed through six parallel penstocks. Power used for production of aluminum.

Yorkton Compressed Air Water Works System.—By F. T. McArthur. Can. Engr., April 15, 1910. 1½ pp.

An illustrated description of a 500,000 daily capacity plant.

Water Powers in Northern Ontario.—By L. V. Rorke. Can. Engr., April 15; 1910. 2 pp.

Abridged from an address made before the Engineers' Club of Toronto. A description of the topographical features of the Hudson Bay water shed with reference to the discharge and horsepower available of different streams.

The Construction of the Rainbow Falls Hydro-Electric Development. — Com. & Eng. News, April, 1910. 5¾ pp.

A description of the construction of the dam on the Missouri River where 21,000 K.W. will be developed with a 108-ft. head. Illustrated.

RIVERS, HARBORS AND CANALS.

The Excavating Equipment on Contract 61, Barge Canal.—Eng. Rec., Apr. 2, 1910; ½ p.

Describes scraper bucket excavation plant with some dates on force employed and output.

Excavating Plant on Contract 29, Barge Canal.—Eng. Rec., April 2, 1910; ⅓ p.

Outlines scraper bucket excavation plant and gives some general data on operation and output.

Excavation Methods on Contract 9, Barge Canal.—Eng. Rec., Apr. 2, 1910; 1¼ pp.

Describes scraper bucket excavation plant used and general method of operation with some general figures of output.

The Construction Plant on Contract 40, Barge Canal.—Eng. Rec., Apr. 2, 1910; 4½ pp.

Describes the plant used comprising cantilever cranes, cableways, double boom excavator and central power plants. Chiefly of interest as illustrating scheme adopted of loading cranes, cableways, etc., with steam shovels. Some general figures of yardage are given.

Lock of the Black Roak Harbor Improvement, Buffalo.—Eng. Rec., Apr. 2, 1910; 2 pp.

Describes construction of steel sheet pile cofferdam 260 x 947 ft., and general arrangement and operation of plant for constructing the concrete lock.

Progress in the Improvement of the Detroit River.—Eng. Rec., Apr. 2, 1910; 2½ pp.

A general description of the progress being made and of the general methods of work.

A Comparison of Stream Discharges Indicated by Current Meter and by Weir Formulas, Yakima River, Wash.—Eng. News, Apr. 28, 1910; 1⅓ pp.

Compares by means of diagrams, results obtained by current rates and by formula for an overflow dam.

The Influence of Forests on Climate, Floods and Erosion.—Eng. News, Apr. 14, 1910; 2¾ pp.

A criticism of the arguments and figures presented in the report to Congress of Willis L. Moore on The Influence of Forests on Climate and on Floods, which was printed in Eng. News, March 3, 1910.

Cumberland River Canalization.—Eng. Rec., Apr. 16, 1910; 2⅔ pp.

Illustrates general structural features of crib dams and concrete locks. Nos. 4 and 5 of above named improvement describes briefly the work and gross itemized costs of the work.

Construction of the Tribes Hill Lock and Dam, Barge Canal.—Eng. Rec., Apr. 2, 1910; 2⅔ pp.

Shows layout of work and contractors' plant and describes the general methods employed for the concrete work.

Method of Building Lock and Dam.—Contr., April 15, 1910. 6 pp.

Work on structures on the Monongahela River at Brownsville, Pa. An illustrated description of the government work.

RAILWAYS

Proposed Catenary Construction for Harlem River Branch of New York, New Haven and Hartford Railroad.—Elec. Ry. Jl., April 16, 1910; 2½ pp.

A descriptive and illustrated article on a 6,000 ft. 4 track experimental section built last fall at Stamford, Connecticut.

Report on Milwaukee Traffic.—Elec. Ry. Jl., April 9, 1910; ⅔ p.

Condensed preliminary report of the Wisconsin Railroad Commission on the traffic conditions of the Milwaukee street railway system.

Stresses Developed by Collisions of Freight Cars.—By Col. B. W. Dunn. R. R. Age-Gaz., Apr. 22, 1910; 3 pp.

An article relating to the allowable speeds for freight cars in coupling. A discussion of the subject with descriptions of tests that have been made.

Track Elevation on the Chicago, Milwaukee & St. Paul, at Evanston, Ill.—R. R. Age-Gaz., Apr. 8, 1910; 4⅔ pp.

This article gives a description of the work, illustrations and plans showing the construction and designs of the concrete subways and also describes the methods used to handle traffic during construction.

The Railways Cost of Living.—R. R. Age-Gaz., Apr. 15, 1910; 3½ pp.

This paper is a discussion of the increasing living cost of railways based upon the report of the Interstate Commerce Commission. The account of the railways for 1897 is compared with that for 1907 with diagrams.

New Locomotive Terminal of the Vandalia at Terre Haute.—R. R. Age-Gaz., Apr. 22, 1910; 3¼ pp.

A description of this terminal with plans of tracks, of engine house and of the 750 ton capacity coaling station.

Western Pacific Yards and Terminals.—By Gustave E. Lunsnerich. R. R. Age-Gaz., Apr. 22, 1910; 5¼ pp.

A well illustrated article relating to the design of yards and terminals of the Western Pacific Ry. using a report of the traffic tonnage of the road as a basis. Plans of engine terminals car terminals, yards and railway buildings are given.

Some Engineering Features of the Detroit River Tunnel.—R. R. Age-Gaz., Apr. 29, 1910 5¼ pp.

A description of the method used in sinking the steel shells into a trench dug in the bottom of the river, uniting them end to end and embedding them in a concrete casing, and lining them. This article contains photographs of different steps of the work, and sections drawings showing the completed tunnels.

Cost of the New York Subway and of Operating It.—Eng.-Contg., Apr. 13, 1910; 1¼ pp.

Gives mileage of different types of construction, quantities per mile of track, contract prices, character and amount of plant and equipment, and itemized operating costs.

Construction of a 135-Mile Wood Stave and Cast Iron Pressure Pipe Line for Railway Water Supply with Some Costs.—Eng.-Contg., Apr. 13, 1910; 2¼ pp.

The 135-mile line raised in size from 16 ins. to 3½ ins. Article describes structural features of both wood stave and cast iron pipe, gives results of tests on pipe line leakage, gives character and amount of pipe breakage, describes in detail methods of laying pipe and trenching, and gives unit costs laying both wood stave and cast iron pipe.

Method of Reconstructing the Washington Street Tunnel of the Chicago Railways Company; a New and Economical Method of Constructing Tunnels.—Eng.-Contg., Apr. 20, 1910; 5 pp.

Work comprised replacing old tunnel with new and deeper tunnel. General structural features are illustrated and described and method of construction described in detail. Article notable for special system of construction employed.

Traffic Conditions Influencing Passenger Subway Construction in Chicago, Ill.—Eng.-Contg., Apr. 29, 1910; 3⅔ pp.

Describes and gives map of present transportation lines, gives statistics of passenger traffic on both elevated and surface lines in

A Book of Instructions For Reinforced Concrete Inspectors

INSPECTORS' HANDBOOK OF REINFORCED CONCRETE

BY

W. E. BALLINGER and EMILE G. PERROT

This book was written for the purpose of assisting inspectors in carrying out plans and specifications under which they are working. It points out the essentials governing the construction of reinforced concrete buildings and is divided into three general divisions, each division embracing a study of one of the main elements that enter into the construction of this class of buildings. These are, first, the "Forms or Falsework," second, the "Reinforcement" and third, the "Concrete."

Flexible cloth; 4½x6½ in.; 64 pp.; 6 Folding Plates, and an Appendix of Formulas and Tables. Price, $1.00 net.

CONCRETE-STEEL CONSTRUCTION

(Der Eisenbetonbau)

BY

PROF. EMIL MÖRSCH

of the Zurich Polytechnic

Authorized Translation of the Third (1908) Edition

By E. P. GOODRICH, C. E.

Mörsch's "Eisenbetonbau" is the clearest exposition of European methods of Reinforced Concrete Construction that has yet been published and is a recognized standard in Europe. It also has had an extensive sale in this country, but the comparatively limited usefulness of the German edition has prompted its translation and publication in English. It contains much information not given in any other book in the English language, and we highly recommend it as a necessary work for every engineer dealing with reinforced concrete design and construction.

Cloth; 6½ x 9½ inches; 364 pages and 350 illustrations. Price, $5.00 net.

ENGINEERING NEWS
BOOK DEPARTMENT
220 Broadway New York.

tables and by diagrams showing hourly records, illustrates and describes congestion in loop district and discusses the data given.

Valuation of the Railways of Texas. Eng.-Contg., Apr 20, 1910, ⅔ p.

Summarizes valuation per mile of all lines and gives detailed cost by items of reproducing the Beaumont & Great Northern R. R.

Cost of Operating the Manhattan Elevated Railways.—Eng.-Contg., Apr. 20, 1910, ¾ p.

Gives statistics of track mileage, plant and equipment and cost of same and itemizes and analyzes the cost of operation for 1908.

Method and Cost of Constructing Street Railway Track, with Grouted Crushed Stone Foundation. Eng.-Contg., April 20, 1910, ⅓ p.

Describes methods of construction and gives itemized unit costs of track and foundation and of concrete pavement foundation and brick paving. Same article, Eng. News, 1910.

A Two-Story Street Railway Terminal of the Public Service Railway, Hoboken, N. J.—Eng. News, Apr. 21, 1910, 3 pp.

Gives general plans and some details of steel work for a two-story loop terminal structure for street cars. General description of the plans. Track lay-outs are shown.

A Five-Mile Trestle Across Albemarle Sound, Norfolk & Southern Ry.—Eng. News, Apr. 21, 1910; 2⅔ pp.

General description of structural features of pile trestle some 5 miles long. Chiefly interesting for drawings of trestle construction.

City Track Construction for Electric Interurban Railways. Eng. News, Apr. 14, 1910; ¾ p.

Discusses general requirements of city track construction and, in detail, method of construction with grouted crushed stone foundation, with itemized costs.

The Long Island Improvements of the Pennsylvania System.—Eng. Rec., Apr 16, 1910, 4 pp.

Gives general map and yard lay-outs for the Sunnyside yards of the above named railway. A general description of the work accompanies the plans. Of interest particularly for the yard track plans shown.

Forest Hills Terminal, Boston Elevated Railway.—Eng. Rec., April 6, 1910; 3 pp.

Illustrates main structural features and describes the construction of an elevated station 75 ft. x 360 ft., built of steel encased in concrete. A number of drawings are given of the sectional forms used in concreting the steel work.

Tunnel Lining, Chicago, Milwaukee & Puget Sound Railway. Eng. Rec., Apr. 2, 1910; 2 pp.

Describes plant and general methods employed in lining with concrete a number of railway tunnels. Some data are given regarding arch centers.

Reconstructing a River Tunnel.—Contr., April 1, 1910, 6 pp.

Methods employed on work now in progress on Washington street tunnel under Chicago River. Illustrated.

Cost of Constructing and Operating the Electric Street Railways of Long Island City.—Eng.-Contg., April 27, 1910, 1⅓ pp.

Gives mileage and equipment and most costs of construction and of operating for 1908.

BRIDGES, BUILDINGS AND FOUNDATIONS.

Piers of the Penhorn Creek Railroad Viaduct.—Eng. Rec., Apr. 2, 1910; 1 p.

General description of methods of sinking cylindrical concrete caissons by open dredging. Interesting because of the use of concrete cylinders.

Erection of Florida East Coast Railway Bridges.—Eng. Rec., Apr. 2, 1910; 3 pp.

Describes general method of erecting plate girder viaduct spans. Useful details for drawings of traveling derrick used.

Oak Point Float Bridge Substructure Construction.—Eng. Rec., Apr. 2, 1910; 2 pp.

General description of constructional features of the substructure for a group of 12 float bridges. Chiefly of value for drawings of crib and pile rack construction.

The East Olive Avenue Bridge in Spokane, Wash. Eng. Rec., Apr. 2, 1910, 2¼ pp.

General description of five-span arch bridge 565 ft. long and of the construction plant and

Importance of Cost Keeping

Whether his work be inspecting, surveying, drafting, or in charge of constructing, the engineer should record both the cost of the work he himself is doing and the cost of all work that comes under his observation. His ability not only to estimate future work but to reduce its cost depends upon his detailed knowledge of costs. Cost keeping, therefore, should be studied by every engineer. "Cost Keeping and Management Engineering," by Halbert P. Gillette and Richard T. Dana, has met with universally favorable reviews from the engineering press, and cannot fail to be a great aid to every engineer and contractor. The book is 6x9 inches, 360 pages, and its price is $3.50 net, postpaid.

The Myron C. Clark Publishing Co.

355 Dearborn Street, Chicago
13-21 Park Row, New York

The Greatest Treatise on Concrete

We publish nine excellent books on concrete, each covering a different branch of the subject. But if only one book can be afforded by an engineer, we recommend Reid's "Concrete and Reinforced Concrete Construction." It remains the largest American book on concrete (906 pages (6x9 inches)—and its wealth of line drawings (715 illustrations) gives it precedence over every other book in the English language for expensive "cuts." Not only does Reid's "Concrete" take precedence for size, but for its thoroughness of exposition and for detailed information of this vast subject. This is indicated pretty well—although inadequately—in the 16-page pamphlet giving table of contents and sample pages, which you will do well to send for.

The price of the book is $5 net, postpaid. If interested in special treatises on concrete, send for our eight pamphlets of eight books on concrete, besides the one above mentioned.

The Myron C. Clark Publishing Co.

355 Dearborn Street, Chicago
13-21 Park Row, New York

The October Number Contains

"Clay Products"

By A. V. BLEININGER,
Ceramic Chemist with the Clay Products Section of the U. S. Geological Survey.

An extensive paper on the work of the Section, giving results of tests on clay products used in construction work.

"Contracts for Structural Steel Work'

An extensive discussion by Attorneys, Architects, Engineers and Contract Managers, covering "Liabilities;" "Penalties," "Damages," "Arbitration," "Relations of Parties in a Contract," and "Payments." Forms of Contracts of unusual merit are given.

'Possibilities of Commercial Automobiles"

By W. W. MACFARREN,
Mechanical Engineer.

An illustrated paper with discussion covering commercial problems of transportation with data on costs per ton-mile, mechanical considerations, etc.

Proceedings

The Engineers' Society of Western Pennsylvania

50 cents per copy. $5 per year.

ELMER K. HILES, Secretary,
803 Fulton Building, PITTSBURGH

Two "System" Books

These two books will not exactly meet your needs in every particular. No book on systematizing construction work can; but there is a wealth of suggestions in these books which can be used to advantage on your own construction work, no matter what kind it may be. We are speaking of "Bricklaying System" and of "Field System," by Gilbreth. One review of "Bricklaying System" pronounced it the only practical treatise on bricklaying ever written, and a remarkable book in that it described methods of greatly reducing the cost of laying brick, in spite of the fact that the art is as ancient as the pyramids.

The "Field System" is a series of rules and instructions for the guidance of superintendents and foremen, the object being to secure uniformity of procedure and economy of performance on general contract work.

The "Bricklaying" contains 330 pages (6x9 inches) and its price is $3.00 net, postpaid.

The "Field System" contains 194 pages (bound in leather) and its price is $3.00 net, post paid.

The Myron C. Clark Publishing Co.

355 Dearborn Street, Chicago
13-21 Park Row, New York

method of construction. Two half sections of the bridge structure are shown

A Portable Floating Cofferdam.—Eng. Rec., Apr. 2, 1910, 1⅓ pp.

Illustrates and describes special movable cofferdam used for unwatering seams in face of a dam below water. General methods of use are described with total costs.

Different Methods of Erecting Steel Viaducts.—Eng. Rec., Apr. 2, 1910, 1¼ p.

A descriptive article outlining the various methods commonly employed in erecting steel viaducts. Interesting as a general summary of practice.

Deep Pneumatic Foundations for New York Municipal Building.—Eng. Rec., Apr. 2, 1910, 2 pp.

Describes plant employed and general methods of work in sinking 107 caissons for column foundations.

Steel-Frame Buildings at Gary, Ind.—Eng. Rec., Apr. 9, 1910, 2 p.

Illustrates and describes the main features of the structural steel work for a number of large mill buildings.

Deep Foundation Construction in an Occupied Building.—Eng. Rec., Apr. 6, 1910; 1 p.

Describes method of sinking separate foundations for 600-ton vault inside of and through the foundations of a bank building. Steel cylinders filled with concrete were sunk by the Clark process.

A Storage Building for an Automobile Factory.—Eng. Rec., Apr. 16, 1910, 1½ p.

Describes the general construction of a large 4-story reinforced concrete warehouse, with flat steel floors.

Erection of Steel Frame Buildings at Gary, Ind.—Eng.-Rec., April 23, 1910; 2⅔ pp.

Describes and illustrates two steel traveling derricks used in erecting steel work for several large mill buildings.

Pneumatic Caisson Piers in Alaska.—Eng. Rec., April 23, 1910; 3⅔ pp.

Illustrates design of caissons and locks and describes general methods of sinking caissons and constructing many for several large concrete piers.

The Superstructure of the McKinley Bridge at St. Louis.—Eng. Rec., April 30, 1910; 2½ pp.; folding plates.

Illustrates profile elevation and details of viaduct approach and main iron spiners (500 ft.) for this new Mississippi River bridge 2,514 ft. long. The drawings are briefly described.

Open Cofferdam Foundations in Quicksand.—Eng. Rec., April 2, 1910, 1⅓ pp.

General description of method of underpinning adjacent buildings and cofferdamming a foundation excavation about 95x100 ft. Drawings are given of special details and a few data on driving sheet piles.

The Bear River Viaduct.—Eng. Rec., April 30, 1910, 1½ pp.

Describes the structural features and general method of erection of a single track railway viaduct 810 ft. long and 192 ft. high.

The Erection of Tinkers Creek Viaduct.—Eng. Rec., April 2, 1910, 3 pp.

Describes general method of erecting a double track, plate girder viaduct 1,300 ft. long. Detail drawings of the erection traveler are given and with description constitute the useful feature of the article.

The Passyunk Avenue Bridge Piers.—Eng. Rec., April 2, 1910, 2 pp.

Describes with illustrations of essential details construction of timber caissons for two piers sunk in 22 ft. and 35 ft. of water. Illustrates diagram layout of contractor's plant and describes general method of construction.

A Steel Arch Bridge in the Province of Yun-Nan, French China.—Eng. News, April 21, 1910, 1¾ pp.

Illustrates and describes structural features and general method of erection of an arch of 180½ ft. span composed of two triangular trusses hinged at springs and crown.

Widening the Floor of a Double-Track Masonry Viaduct.—Eng. News, April 14, 1910, 1¼ pp.

Describes and illustrates method of widening a masonry arch bridge by removing parapet walls and extending out a reinforced concrete bracket platform on each side. Details are shown of the bracket construction and reinforcement.

READ THIS BOOK **"SCAMPING TRICKS"** AND BE POSTED

By JOHN NEWMAN

THE author, a well-known civil engineer, describes, in an amusing way, some of the methods that are frequently employed to execute work cheaply and quickly. This book is an eye-opener in more ways than one.

A NEW edition is now READY and we have secured a limited number that we offer at $1.00 per copy, postpaid

Send your dollar NOW while we can fill your order

Spon & Chamberlain, 123 E. C. Liberty St., New York

A Discussion of the Supporting Power of Piles.—Eng.-Contg., April 20, 1910, 2⅓ pp.

Discusses the subject under the heads of piles acting as columns, piles acting as floats, piles as combined columns and floats, forces acting on piles, indirect methods of test and factors theoretically essential to a complete pile formula.

The Calculation of Continuous Bowstring Girders, and Its Application to a Reinforced Concrete Viaduct.—By H. Lossier. Conc. & Cons. Eng., April, 1910. 5 pp.

The present article is a translation from a pamphlet written by Mr. H. Lossier, and deals with the case of a continuous bowstring viaduct designed by Messrs. Consideric, Pelnard & Lossier, and which has just been adopted by the Contras (Gironde) as the result of a competition. The object of the paper is to show the remarkable simplicity with which the ellipse of elasticity permits the solution of apparently very complex hyperstatic systems.

Regulations for Reinforced Concrete Buildings in London.—By Wm. Dunn. Conc. & Cons. Eng. April, 1910. 6 pp.

The question of regulations for reinforced concrete buildings occupied considerable attention before the House of Commons. Mr. Dunn gives his views in this article, which were generally adverse to the regulations proposed.

Prevention and Cure for Weak Foundations.—Cem. Age, April, 1910. 5 pp.

For buildings that could not well be founded on solid rock and whose dimensions do not warrant the use of caissons. The concrete pile is cited as a preventative and the Breachaud patents for the sectional method of underpinning buildings is pointed out as a cure for weak foundations.

Comparative Cost of Girder Construction in Structural Steel and Reinforced Concrete.—By E. G. Perrot. Conc. Eng., April, 1910. 2 pp.

A description of the above as relating to the construction of a large floor above the gymnasium of the Turngemeinde Club house, Philadelphia.

Substructure of New P. & L. E. Bridge.—Contr., April 1, 1910. 3 pp.

Description of construction work on double track bridge, one of the largest cantilever structures yet built.

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, 1735 Monadnock Block, Chicago.

CONCRETE AND REINFORCED CONCRETE.

Application of Concrete in Barge Canal Work.—By Russel S. Grunman. Cem. Age, April, 1910. 6 pp. Cont. from March issue.

Containing descriptions of the method of mixing and placing concrete on the barge canal work, and a general description of the concrete structures on the canal.

The Remarkable Fireproof Properties of Cinder Concrete.—By Prof. Ira H. Woolson. Cem. Age, April, 1910.

On account of the behavior and present condition of the cinder concrete wall of the floor testing building at the fire testing station of the author.

The Properties of German Portland Cements.—By Clifford Richardson. Cem. Age, April, 1910. 2 pp.

The results of a test in the Royal Testing Laboratories at Grosslichterfelde West, near Berlin, in 1907-08.

Cement in Sea Water.—Cem. Age, April, 1910. 1 p.

Condensed from a report of Mr. A. Paulson, Chief Engineer of the Danish State Hydraulic Works.

Reinforced Concrete Coke Bunker at Dunfermline, Scotland.—Conc. & Cons. Eng., April, 1910. 11 pp.

This article gives detailed particulars and drawings of a 390-ton capacity coke bin recently built in Scotland.

Tests on Reinforced Concrete Conducted in Great Britain.—Conc. & Cons. Eng., April, 1910. 8 pp Part VII of a series.

A series of tests on beams and columns. Illustrated.

Reinforced Concrete Trestles.—By C. H. Cartlidge R. R. Age Gaz., April 22, 1910. 3½ pp.

Relating to a standard plan for trestles now in use on the C., B. & Q. R. R. for bridges such as occur a great many times in the Mississippi valley over bayous or swamps. These places may not be filled and if replaced with steel on permanent supports would be very expensive. A detailed plan is given, together with several illustrations.

Concrete Building Construction of Separately Molded Members and Its Cost.—Eng.-Contg. April 6, 1910. 3⅔ pp.

Cites the more notable examples of buildings constructed of separately molded concrete members, gives general and detailed costs and describes various "systems" of construction of this type. The Watson system is described in detail and itemized costs given of large factory buildings. A notably good article on this type of construction.

Design and Construction of Concrete Retaining Walls for Pennsylvania Terminal Station, New York City.—Eng.-Contg., April 13, 1910. 2⅔ pp.

Work includes gravity walls up to 62 ft. in height. Article explains conditions to be met, assumptions made in designing, and general design adopted. Methods of construction are described and drawings of forms given.

Some Methods of Waterproofing Concrete Structures With Results From Practice.—Eng.-Contg., April 13, 1910. 1¾ pp.

A symposium of practice and experience in waterproofing concrete roofs and bridge floors on several large railway systems.

An Analysis of Concrete Bridge Failures.—Eng.-Contg., April 13, 1910. 3½ pp.

Cites eleven failures of concrete bridges of which reliable data could be obtained, illustrates and describes for each case the character of the failure, analyzes the cause of the failure and summarizes the results, showing six failures due to faulty foundations and five due to defective design.

Cost of Abutment Masonry and Slope Paving for Highway Bridge Foundations, Illinois & Mississippi Canal.—Eng.-Contg., April 20, 1910. ⅔ p.

Abutments contained 190 cu. yds. natural cement concrete in footings and 248 cu. yds. Portland cement concrete in abutments proper. Itemized unit costs are given for one bridge and total unit costs are summarized for some 20 other bridges.

Some Experiments on the Cost and Durability of Cement Drain Tile.—Eng.-Contg., April 13, 1910. 1¼ pp.

Gives results of a series of experiments made to determine the cost of hand molding cement drain tile and to what extent water dissolved the cement out of such tile. A notable contribution of valuable data on the much disputed question of the durability of cement drain tile.

Special Forms for and Methods of Constructing Weber Concrete Chimneys.—Eng.-Contg., April 20, 1910. 1¾ pp.

Describes two styles, straight and tapering, of chimneys, discusses the general requirements of successful chimney construction and outlines actual methods of work, with descriptions and illustrations of unique forms for chimney work.

Forms of Concrete Pile Construction and a Statement of the Advantages and Disadvantages of Concrete Piles.—Eng.-Contg., April 20, 1910. 1¼ pp.

Gives historical outline of development of concrete piles, describes the various forms or types of cast and driven piles and cost in place piles, estimates commercial use and itemizes the several advantages and disadvantages of concrete piles. A good general article.

A Three-Hinged Reinforced Concrete Arch Viaduct.—Eng. Rec., April 30, 1910. 3¼ pp.

Illustrates the main structural features and describes the construction of a concrete viaduct of universal arrangement having three-hinged arches made up of separately molded arch ribs.

Methods of Computing Flat Reinforced Concrete Plates.—Eng. Rec., April 9, 1910. 3⅓ pp.

An important mathematical discussion of methods of computing reinforced concrete floor consisting of flat plates supported directly on columns.

A Concrete Girder Bridge with Curved Bottom Chord.—Eng. Rec., April 9, 1910. 1 p.

Gives essential plans and describes structural features of a reinforced concrete girder bridge in which the bottom chords of the girders are curved.

EARTH AND ROCK EXCAVATION.

Hydraulic Excavation in the Pacific Division of the Panama Canal.—Eng. Rec., April 2, 1910, 2¾ pp.

Gives map of area to be excavated by hydraulic ???????? and general plan of pumping plant. Describes the layout and main structural features of work and plant and outlines general plan of operation.

Methods and Costs of Cleaning 30,000 Cu Yds. of Sediment from a Water Works Reservoir.—Eng.-Contg., April 6, 1910, ¼ p.

Reservoir drained and sediment washed out with hose streams. Methods described, time required for and cost of work itemized.

Method and Cost of Making a 16,000 Cu. Yd. Blast on the Pecos & Northern Texas Ry.—By C. S. Young, Eng.-Contg., April 6, 1910, ⅔ p.

Describes arrangement of tunnel and methods of loading and firing blast and gives general costs. Dynamite and black powder were used.

Cost of a Record Steam Shovel Run.—Eng.-Contg., April 20, 1910, ¼ p.

Shovel excavated 4,823 cu. yds. in one day; itemized cost of labor and supplies given, showing a cost of 1.14 cts. per cu. yd.

Cost of Excavating 1,850 Cu. Yds. of Granite in Trench for Sewer Construction.—Eng.-Contg., April 20, 1910, ¼ p.

Gives itemized unit costs of excavating 550 ft. of trench in granite rock.

New Crushing Plants of the Casparis Stone Company.—Eng. Rec., April 2, 1910, 1⅔ pp.

Interesting for plans and sections and layout plats of two large crushing plants. A general description of the main structural features is given.

The Ashokan Reservoir Stone Quarry.—Eng. Rec., April 2, 1910, 1⅔ pp.

Describes the character of the quarry being used to obtain some 1,000,000 cu. yds. of stone for the work named, being general description of methods and plant employed.

SURVEYING AND DRAFTING.

The Stadia and Stadia Surveying.—Eng. News, April 28, 1910, 1¾ pp.

An argument on the usefulness of stadia surveys, with description and illustration of a special stadia rod and numerous notes and instructions on methods.

Tests of Simple and Inexpensive Surveying Instruments.—Eng. News, April 21, 1910, 1¼ pp.

Describes several instruments of the type indicated and gives results of tests made to determine their accuracy. General conclusion is that such instruments are rarely satisfactory.

The Mille Lac Lake Survey, Minnesota; Methods and Costs.—Eng. News, April 7, 1910, 1 p.

Describes method of making a transit and stadia survey and soundings on Mille Lac. Costs of the different items of the survey are given.

Reconnoissance Method of Determining the Volume of Reservoir Sites.—Eng. Rec., April 30, 1910, 3¾ pp.

Discusses the various methods of determining roughly the quantity of water that can be carried by basins available for reservoirs, and describes in detail the triangulation method developed by the author of the article. A notable article.

MISCELLANEOUS.

Sanitation in Construction Camps of the Catskill Aqueduct.—Eng. Rec., April 2, 1910, 3⅓ pp.

Describes arrangement of plant and appliances for disposing of sewage and garbage and other wastes in construction camps. Some of the special apparatus employed is illustrated. A useful article.

Town Scavenging and Refuse Disposal. By Hugh S. Watson. Mun. Eng Mag., May, 1910; 3½ pp.

Describes the various types of English destructions, as Heenan & Froudes destructor, Manlove, Alliot & Co.'s destructor, Goddard, Massey & Warner's destructor, and the Horsfall destructor.

Refuse Disposal in Milwaukee. By Fred S. Sly. Mun. Jl. & Eng., May 4, 1910; 8 pp.

Describes the methods and plants used in Milwaukee during the past 30 years, and gives a summary of the plans contemplated for utilizing surplus steam power for the disposal plant. A detailed description of the refuse destructor finally decided on is given, and several drawings and illustrations of it are shown.

System in Park Expenditures. By Arthur C. Comey. Mun. Jl. & Eng., April 13, 1910, 4 pp.

A description of the way the Park Board of the city of Utica, N. Y., keeps its accounts. Illustraitons of the forms used are shown and their use described.

New York City Pipe Galleries. By Walter G. Turini. Mun. Jl. & Eng., April 13, 1910, 1½ pp.

Describes the pipe galleries constructed in Delancy St., New York city, in connection with the subway.

Subaqueous Tunnels. By R. B. Woodworth, R. R. Age-Gaz., April 8, 1910, 3 pp.

This is the fifth of a series and relates to the shield method of construction. The subject is taken up in practical illustrations. The material for this paper has been drawn largely from the technical press, its purpose being to sort, classify and digest for the use of any tunnel builder.

First Cost of Plant and Cost of Generating and Distributing Electricity for Lighting. Edison Illuminating Co. of Brooklyn.—Eng.-Contg., April 6, 1910, 1⅓ pp.

A critical analysis of costs of plant and of operation for 1907 of the plant named. Unit costs are given per kilowatt or per kilowatt hour. This is a noteworthy article.

Methods of Refuse Collection and Disposal in Boston, With Some Cost Data.—Eng.-Contg., April 6, 1910, ¾ p.

Describes method of collection, gives by districts totals and per capita amounts of refuse of each kind, gives costs of collection and disposal by day labor and by contract and recommends a method of collection and disposal by contract as the more economical.

Municipal Markets of St. Louis.—By Charles Claude Casey. Mun. Jl. & Eng., Apr. 27, 1910. 5½ pp.

A description of three municipally operated markets of St. Louis, Mo. The structural features are described, as well as the methods of sanitation and refrigeration.

Current Prices of Materials, Supplies and Small Tools Used in Construction Work.—Eng.-Contg., April 6, 1910. 5¾ pp.

Current wages for street work in some 100 cities; union wages in New York City; prices for materials, supplies and tools for bridge and building work, concrete and reinforced concrete work, earth and rock excavation, paving and road work, railway work, sewerage and waterworks construction, and miscellaneous work.

Contract News Section

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The State of Florida has again taken steps for the drainage of the Everglades, and is again asking for bids for the work. Bids are now asked for excavating five drainage canals of a total length of 235 miles, requiring 18,000,000 cu. yds. of earth excavation and 6,000,000 cu. yds. of rock excavation.—The Baltimore & Ohio has disposed of $40,000,000 three-year 4½ per cent notes, which will be placed here and in Europe. The proceeds will be used for improvements and the purchase of equipment and the financing will cover the company's requirements for the next three years. The Sundry Civil Appropriation bill has been reported to the U. S. House of Representatives. It carries a total of $111,849,211, among the largest items being the following: $37,859,890 for the continuation of the construction of the Panama Canal; for public buildings, $6,145,000; Life Saving Service, $2,362,000; Interstate Commerce Commission, $1,360,000; rivers and harbors improvements under contract, $8,051,000.—After tests made simultaneously in Canada, the United States and England, at the instance of the Canadian board of engineers, who have prepared the plans for the superstructure of Quebec bridge, the engineers have reported that the plans are satisfactory. As a result tenders for the bridge will be asked shortly.—The largest railroad construction contract of the week appears to be the one secured by H. C. Henry, Seattle, Wash. This contract calls for constructing the Oregon Trunk Ry. from Madras, Ore., south 125 miles. Another large contract let recently was secured by Foley, Welch & Stewart, St. Paul, Minn. This contract called for the construction of a 130-mile branch line between Medford, N. Dak., and Drake, for the Minneapolis, St. Paul, Sault Ste. Marie Ry. In the line of electric railways, the largest contract let recently appears to have been secured by Aug. E. Steffen, Davenport, Ia., the contract calling for the construction of the projected line of the Iowa City, Ottumwa, Southwestern Electric R. R., from Ottumwa, Ia.—The formal opening of the Tucson & Western Coast of Mexico Ry. was celebrated at Tucson, Ariz., on May 5.

Government Aid in Road Building.

The U. S. Government, aside from its attempt many years ago to hold the National Turnpike, has never embarked on any general scheme for building highways. To be sure it established, several years ago, the office of Public Roads as a branch of the Department of Agriculture, and this bureau has done excellent work along experimental lines and in giving instructions in the art of road building. The appropriations allowed the Office of Public Roads, however, have been small, and no attempts have been made by the office to engage in general road construction work. There is now, however, a bill before Congress to appropriate $500,000 for road work. According to the terms of the bill, this amount is to be expended "by the Secretary of Agriculture in co-operation with the Postmaster General in improving the condition of the roads over which rural delivery is or hereafter may be established to be selected by them for the purpose of ascertaining the possible increase in the territory which could be served by one carrier and the possible increase in the number of delivery days each year, the amount required for proper maintenance in excess of local expenditure for rural delivery routes and the relative saving to the Government in the maintenance of rural delivery routes by reason of such improvements, and also the relative saving in the cost of the transportation of agricultural and other products from the farms or other points of production to the usual market place by reason of such improvements." The bill further provides that the state or county shall spend as much money as the government does for the improvement of the rural route or routes selected.

These Decadent Days.

Times change, and men change, and it would also seem that the manners of grading gangs change if there be any truth in the following: Two large railroads had grading crews at work building the grade for branch lines. These crews engaged in a race to reach the point where the two branch lines crossed, the agreement being that the road which first got its grade finished to the crossing point should not have to construct the crossing. As the construction of a crossing would involve a cost of something like $20,000 or $30,000 vigorous efforts were naturally put forth by both gangs to reach the crossing point first. The two gangs were in sight of one another for some little time and this as well as the fact that a bonus was promised the winner added to the interest of the struggle. Finally, however, one of the gangs reached the crossing and then, according to press dispatches, "The foreman of the losing gang came forward and warmly shook his opponent's hand and congratulated him on his success. The men of the grading gangs, after wildly cheering for some little time, fraternalized and then both parties sat down to lunch together," all of which seems to go to show that times and grading gangs change. In the old days when railroads were new grading crews were composed largely of sons of the Emerald Isle: men in red shirts and black hats; men who could work and talk and smoke at the same time; men who would fight the foreman, the walking boss, and the contractor at the drop of the hat. Imagine two of these old-time gangs engaging in a race of this kind. Would it have ended in a shaking of hands?

Mississippi River Improvement Work.

If everything goes smoothly and Congress finally adopts the present River and Harbor Bill, there will be available after July 1 $20,000,000 with which to secure a 6-ft. channel in the Mississippi River from St. Louis to St. Paul. The bill provides that work shall be completed in 12 years, which was something of a disappointment to the advocates of the improvement, who had originally planned on having the $20,000,000 immediately available so that the channel could be completed in 1915 at the time the Panama Canal is to be finished. The bill carries an appropriation of $500,000 for the exploitation of a plan of Ray S. Reid, Waterways Commissioner of Wisconsin, for a new system of tow boats and barges. Permanent and systematic work on the improvement of the Mississippi River was begun in 1878 and has since the beginning continued with little change in policy. The system followed makes use of the principal of contraction of the channel in the closure of chutes, construction of wing dams and revetment of caving banks. The work since 1878 has been to obtain a 4½-ft. channel stage at low water, and the work of the future will be to extend the wing dams to create further contraction and secure the 6-ft. low-water channel stage. Up to the present time about $10,200,000 has been expended by the Government.

Special Dispensation for "Sand Hogs."

Those of our contractor friends who employ that class of workers euphoniously named "sand hogs" will be interested in a court announcement recently made in the case of a colored gentleman, William Smith, who had stabbed a friend in the excitement resulting from a disputed crap game. Mr. Smith seemed in a fair way to get the law's limit of five years for his pleasure when it developed that he was a compressed air worker or "sand hog." The judge, therefore, made the sentence six months with the following announcement: "Court records seem to prove," said his honor, "that, either because they breathe too much oxygen or are affected by the air pressure, sand hogs are more quarrelsome than the average man of other callings. They are constantly getting into trouble and I think, in part at least, they cannot help it." The moral would seem to be: Don't play craps with a colored man full of "oxygen."

No Free Transportation in Texas.

One of the time-honored perquisites of the railroad contractor appears to be threatened, in Texas at least, by a recent opinion of Assistant Attorney General of that state. The Missouri, Kansas & Texas R. R. had asked permission of the State Railroad Commission to issue passes for the men in the employ of a grading contractor and had also asked permission to deadhead the grading outfit. The opinion issued by the Attorney General held that such action would violate Section 2, Chapter 42, Acts of the 30th State Legislature, and that the Commission had no authority to approve such an application.

The New Orleans Great Northern R. R., N. G. Pearsall, general manager, Bogalusa, La., is stated to have purchased right of way and made all arrangements for the establishment of its own terminal facilities in Jackson, Miss. Right of way has been purchased for a distance of two miles north of the corporate limits. It is also stated that plans have been formed for an extension of the line in a northeasterly direction up the Pearl River Valley, with the ultimate purpose of building a north and south trunk line.

Grading and clearing work on the Florida extension on Piney Island near Fernandina, Fla., is well under way. The Florida Construction & Realty Co. has the contract for the work as stated some time ago in this paper. Frank Drew, Live Oak, Fla., is president of the railway.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

GEORGIA.

The Griffin City & Suburban Ry. Co. of Griffin, Ga., recently incorporated, proposes to construct four miles of street railway in Griffin and its suburbs. The company hopes to begin construction work in July. H. H. Bass, Griffin, Ga., is interested.

The Rome & Northern R. R. has completed location surveys for its 34-mile extension from Gore to Tunnel Hill, Ga., to a connection with the Western & Atlantic R. R., and construction contracts will be let in a short time. R. G. Peters, Manistee, Mich., is President and H. M. Smith, Rome, Ga., is Chief Engineer.

IDAHO.

The Caldwell, Roswell, Big Bend Interurban Ry. Co. has been organized and proposes to build an electric railway southwest from Caldwell, Idaho, to Snake River via Roswell, a total distance of 27 miles. H. S. Kneedler, secretary, Caldwell, informs us that the right of way has been pledged and that residents along the line will give $109,000 in the form of assessments on land within 3 miles radius. The company has been incorporated with a capital stock of $250,000, of which $27,000 has been subscribed. Surveys for the line have been made. H. S. Williams, Caldwell, Idaho, is chief engineer, and H. W. Dorman, Caldwell, is president.

IOWA.

Aug. E. Steffen, Davenport, Ia., has been awarded the contract for constructing the projected line of the Iowa City, Ottumwa Southwestern Electric R. R. This company projects a 75 mile line between Ottumwa and Iowa City, via Sharon Center, Frytown, Amish, Wellman, Krota and Ollie. Frank Tanner, Iowa City, Ia., is vice president.

KANSAS.

The Wamego & Rock Creek Valley Ry. is ready for bids from contractors for grading 20 miles of line from Westmoreland to Wamego. The work is to be completed in one year and will require 367,000 cu. yds. of earth excavation. C. C. Eastman, Westmoreland, Kan., is chief engineer.

NEBRASKA.

The Falls City, Sycamore Springs, Sabetha & Southwestern Ry. Co. has completed surveys for its projected 21 mile line. The capital for construction has not been secured as yet and no construction contracts will be let until it is obtained. George Campen, Lincoln, Neb., is chief engineer; J. H. Miles, Falls City, Neb., is president, and E. V. Kauffman, Sabetha, Kan., is vice president.

NORTH CAROLINA.

T. T. Adams Co., Richmond, Va., has been asking bids for constructing eight miles of narrow-gage steam logging road along Armstrong Creek, McDowell County, N. C. The road is to be used for hauling logs into the plant located on C. C. & O. Ry.

NORTH DAKOTA.

Foley, Welch & Stewart, St. Paul, Minn., have been awarded the contract by the Minneapolis, St. Paul & Sault Ste. Marie Ry., for constructing 130 miles of branch line between Medford, N. Dak., and Drake.

OREGON.

H. C. Henry, Seattle, Wash., has been awarded the contract for constructing the Oregon Trunk Ry., from Madras south 125 miles. Work on that section of the Oregon Trunk Ry. from Clio to Madrid, 110 miles along the west bank of the Des Chutes River is now about 75 per cent completed and should be finished for trains about Jan. 1, 1911. Porter Bros., The Dalles, Ore., Spokane and Portland, have this contract and have the following sub-contractors at work: W. E. Boie & Co., Boyington & Stevens, Bergstrom Bros., L. P. Campbell, Baker & Scarpelli, H. B. Boie & Co., A. Scarpelli & Co., Burns & Jordan, D. V. McDonald, H. E. Carleton & Co., A. E. Griffin & Co., Copenhagen Bros., C. A. McPhail & Co., Randall & Baker, McDonald & Nelson, A. M. Dassault, Porter & Conley and Porter & Clarkson. The Porter Bros'. contract includes 1,000,000 cu. yds. of earth excavation, 4,325,000 cu. yds. of rock excavation, 100,000 cu. yds. of embankment, 3,000 lin. ft. of rock tunnels, three steel bridges about 300 ft. long each and one steel bridge over the Columbia River, 50 wood trestles, about 5,000 lin. ft. in all, 15,000 cu. yds. of concrete masonry for piers of the steel bridges and stone masonry for the Columbia River bridge; also 40,000 to 50,000 lin. ft. of piling in trestle foundations.

TEXAS.

All financial arrangements have been made for the Aransas Pass & Northern R. R. and engineering work is now underway. Construction work will be commenced about Oct. 1. James H. Collins, 88 LaSalle St., Chicago, Ill., is interested.

Harty & Ford, 307 Scanlan Bldg., Houston, Tex., has finished all of the clearing on its section of the Galveston-Houston interurban line and has started grading with 50 teams. The fencing gang is following close behind the grading. It is hoped to complete the grading by Sept. 1.

M. J. Healy, Pyote, Tex., is promoting a project for the construction of a 350-mile line from Tucumcari, via Texico, thence south through the border counties in Texas and New Mexico. The road is to be known as the Tucumcari, Portales & Gulf R. R., and surveys have been made for the first 50 miles.

The Eastern Texas Traction Co. has surveys underway for its projected line, and has made arrangements for securing the capital for its construction. The projected length of this road is 150 miles and its route is Greenville, Wolfe City, Benham, Paris, Denison and Dallas. Joseph F. Nichols, Greenville, is secretary.

C. M. McConnico, Ed. Powell, and J. S. Moore, of Lufkin, Tex., have sub contracts from the Grigsby Construction Co. of Dallas, Tex., for grading work on the Temple & Northwestern Ry. extension from Temple to Hamilton. This extension requires about 100 miles of grading work averaging 12,000 cu. yds. per mile, and including some rock. The line of the road crosses the Leon River five times.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO

The Chama Valley Lands & Irrigation Co. of Kansas City, Mo., has purchased the "Tierra Amarilla Grant" of 520,000 acres, located in Archuleta County, Colorado, and Rio Arriba County, New Mexico. This tract of land embodies within its borders something over 100,000 acres of irrigable land, and also about 80,000 acres well adapted to dry farming. The company will in the immediate future spend about $1,000,000 for installing an irrigation system. H. I. Reid, Colorado Springs, Colo., is engineer.

FLORIDA.

Bids are being asked by the Board of Drainage Commissioners of the State of Florida, at the Capitol, Tallahassee, Fla., until 10 A. M., June 15, for excavating five drainage canals in the Everglades. The aggregate length of these canals is 235 miles, and their construction requires the excavating of approximately 18,000,000 cu. yds. of earth and 6,000,000 cu. yds. of rock. Specifications, etc., can be obtained from J. O. Wright, Chief Drainage Engineer, Tallahassee, Fla.

MICHIGAN.

J. E. Hathaway & Co., Milwaukee, Wis., at $55,616 was low bidder Apr. 29, for repair of south revetment at Grand Haven, Mich., for the U. S. Government. The work includes cutting down and removing old work, oak piles, oak timber, pine or Douglas fir timber and plank, drift bolts, screw bolts, angle irons, tie rods, spikes, carriage bolts and pile shoes.

NEW JERSEY.

The International Contracting Co., 17 Battery Pl., New York City, has been awarded the contract for dredging in the Passaic Run below the Montclair and Greenwood Lake Bridge, New Jersey, for the U. S. government. Bids for the work were opened April 26. The contract price is 50 cents per cu. yd., and the work amounts to about 39,000 cu. yds.

NEW MEXICO.

Will Benson, C. E., Artesia, N. Mex., has been granted 90 second feet of water from the Penasco River in Eddy County. The company in which Mr. Benson is interested will install an electric power plant capable of developing 10,000 hp. The power will be used mostly to pump water for irrigation.

Plans are under way for the construction of a power plant on the Penasco River, about 30 miles west of Artesia, N. Mex. It is proposed to construct a flume about 1,500 ft. long, which will carry about 100 cu. ft. of water per second, giving a fall of about 97 ft. It is expected to use the power for pumping purposes on the lands in the Artesia District. W. P. Turner, 221 North Main St., Roswell, N. Mex., is interested.

OHIO.

The Great Lakes' Dredge & Dock Co., Williamson Bldg., Cleveland, has begun work on its contract for dredging Secs. Nos. 1 and 2 of the Cuyahoga River for the City of Cleveland. The contract includes 525,000 cu. yds. of earth excavation, and the company is using a 4 cu. yd. dipper dredge on Sec. No. 1 and a 7 cu. yd dipper dredge on Sec. No. 2.

OREGON.

Eschbach-Bruice Co., North Yakima, Wash., have been awarded the contract for the construction of an earth dam with concrete core at Coe Siding, on the Q. R. & N. Ry., for an irrigation project. The contract includes 140,000 cu. yds. earth excavation, 3,000 cu. yds. rock excavation and 1,500 cu. yds. concrete masonry.

The plans of the Eastern Oregon Irrigation Co. are being rushed to completion and the Company hopes to perfect them so, that actual work of construction can be started this season. The project will call for about 30 miles of main canal, carrying at least 500 second feet of water, one diversion dam of reinforced concrete, at least one large impounding dam and all of the lateral canals, the length of which cannot be stated at this time. The project will provide water for the irrigation of about 30,000 acres of rich fruit lands located in Baker County, Oregon, the water being appropriated from Eagle Creek which is one of the best and most reliable streams in the entire State of Oregon. E. M. Blake, 301 Overland Bldg., Boise, Idaho, is General Manager.

RHODE ISLAND.

Following bids were received April 27, by Lieut. Frank H. Phipps, Contracting Q. M., Fort Adams, R. I., for the construction of sea wall and removal of face cover at Fort Adams: (1) Standing for construction of rip rap wall, (2) for construction of granite block wall, (3) for excavation Area A, (4) for excavation of Area B, (5) for excavation of both areas, and (6) for construction of wall with interlocking concrete pile to it 8 ft. m. l. w. John Cashman & Sons Co. West Quincy, Mass., (1) $10,000, (2) $16,000, (3) $12,000, (4) $7,000. Boston & New York Contracting Co., 220 Devonshire St., Boston, (3) $14,944, (4) $8,900, (5) $22,974. Joseph C. Terry, Fall River, Mass., (1) $12,000, (2) $12,000. Roy H. Beattie, Fall River, Mass., (1) $7,490. Phoenix Construction Co., 41 Park Row, New York, (1) $17,000, (2) $35,000, (3) $21,600, (4) $8,400. The T. A. Scott Co., Inc., New London, Conn., (2) $15,830. Darling & Slade, Fall River, Mass., (1) $10,700, (2) $11,200, (3) $15,420, (4) $4,870. The Underpinning Co., 290 Broadway, New York, (1) $16,000, (3) $9,500, (4) $5,525, (6) $18,000.

SOUTH DAKOTA.

Sweeney & Son, White Bear, Minn., have been awarded the contract at 6.7 cts. per cu. yd. for constructing the Conde open dredge ditch for the Commissioners of Codington County, S. Dak. Bids for the work were opened May 4. The ditch is to be 13 miles long and the excavation will be 15 ft. wide at the bottom, 25 ft. wide at the top and the depth will not exceed 8½ ft. Material includes no rock and consists of soil, dark loam.

MEXICO.

Thos. B. Ragan, No. 120 6a Calle de Ayuntamiento, Mexico City, Mexico, has a proposition to supply the City of Vera Cruz, Mexico, with a modern water system. He proposes to bring the water from a neighboring stream, which is to be dammed at a point at 21 miles from the city. The water is to be brought to the city through a 3-ft. concrete pipe.

S. Pearson & Son, 4 a Calle de Humboldt 31, Mexico, D. F., has work now under way on a contract for a large hydro-electric development scheme on the Conchos River at Santa Rosalia, Chihuahua, in the north of Mexico. The contract includes: earth excavation, 74,000 cu. meters; rock excavation, 278,000 cu. meters; concrete masonry, 82,000 cu. meters; stone masonry, 275,000 cu. meters; fill, 141,000 cu. meters; clearing, 606,000 sq. meters. The contract includes one main dam, dimensions of which are 80 meters high and 250 meters long crest; one subsidiary dam 730 meters long and 22½ meters high in deepest part, railway line standard gage 35 kilometers long between Sta. Rosalia and the site of the dams at La Boquilla. Power houses and generating stations and sub-stations, 200 miles of steel towers and transmission lines; also administration and staff houses and offices as well as workmen's dwellings and all other appurtenances. There are 70,000 cu. meters of excavation in the foundations of the dam, and in the spillway which is 60 meters wide there are 200,000 cu. meters of rock excavation. The plant when completed will develop 40,000 H. P. Fred Adams is Managing Director for the contractors.

Reports are to the effect that the Great Northern Ry. Co. is considering the construction of the proposed line from Bismarck, N. Dak., to Sioux City. The new line as projected will follow the west bank of the Missouri River to Pierre, S. Dak., where it will cross the stream. H. F. Hamilton, Minot, N. Dak., is Resident Engineer of the company.

Organization of the Newton Northwestern R. R. has been completed and charter obtained to construct the projected line from Newton, Miss., to Carthage in Leak County. Surveyors are now in the field procuring right of way for the line. The following are the incorporators: D. L. Ragland, W. A. Brown, W. V. Fant, H. C. Maiure, J. C. McClinton, W. B. Richardson and T. A. Baucum of Newton, Miss. The directors as follows were appointed: D. L. Ragland, President; W. A. Brown, Vice President and Manager; W. V. Fant, Secretary and Treasurer; W. B. Richardson and T. A. Baucum.

President Miller of the Laramie, Hahn's Peak & Pacific R. R., has appointed R. D. Stewart Chief Engineer and J. J. Argo, Laramie, Wyo., Locating Engineer of the company. The latter will organize an engineering corps to locate a line for the extension of the railroad into Rout County, Colo.

P. Costello, of Blanching, Ill., has moved his outfit from Savanna, Ill., to a point near Arena, N. Dak., where he has a railroad grading contract. O. S. Smith, of Steele, N. Dak., has a contract east of Arena, some six or eight miles.

The Fort Smith, Van Buren & Eastern Interurban Ry. Co., of Fort Smith, Ark., is said to be ready to begin building its road as soon as the city council of Van Buren, Ark., grants the desired right of way.

C. A. Magee, Parkston, S. Dak., who is promoting a project for the construction of an electric railway from Sioux City to Wessington Springs via Sioux Falls, S. Dak., is reported to have disposed of the bond issue in Holland.

Surveys are to be started at Abbeville, S. C., for an electric railway to extend from that city to Greenville, S. C. From Donalds to Abbeville, 15 miles, there will be only one small stream to cross and no heavy grades. J. S. Stark and R. E. Cox of Abbeville and R. C. Brownlee and Dr. Jesse Bell of Due West are interested.

Preliminary surveys are to be started from Winnemucca this month, it is said, for the proposed railroad from Winnemucca to Paradise Valley. It is intended to ultimately extend the line north through Quinn River Valley to National and McDermitt and thence through Jordan Valley, Oregon, to Caldwell or Boise City, Idaho. J. G. Jacobs, Salt Lake City Utah, is the promoter. R. E. Tilden, Winnemucca, Nev., is the engineer.

Residents of Pensacola, Fla., have requested the City Council to grant them a franchise for a railroad in that city. It is proposed to revise the Andalusia R. R. project and to have Pensacola parties construct the line from Pensacola to Andalusia.

The Arizona Eastern R. R., L. H. Long, Assistant Chief Engineer, Tucson, Ariz., is reported to have offered to take over the bonuses and right of way of the projected Phoenix & Buckeye R. R., and to construct that line to east side of the Hassayampa River by Aug. 1. The offer is conditioned on the Phoenix & Buckeye R. R. securing an ordinance permitting the building of a line into Phoenix, Ariz., from the west, together with some additional right of way, etc.

Advices from De Funiak, Fla., state that the proposed Gulf, De Funiak & Northern R. R. has completed surveys at that place for its terminal and is now engaged in surveying for its line.

Truck growers of Long Beach, Miss., are asking that the Gulf & Ship Island R. R., J. T. Jones, President, Gulfport, Miss., build a spur track to the gardening section of Long Beach, Miss.

The Hartford Electric Light Co., of Hartford, Conn., is to increase its capital stock by $600,000. The new capital will be used to double the capacity of the plant at Dutch Point.

The Frederick R. R., O. B. Coblintz, Chief Engineer, Frederick, Md., has filed a mortgage for $1,500,000 to secure a new bond issue to refund the oustanding bonds on the properties of the road and to make extensive improvements, including the extension of the road from Thurmont to Emmitsburg and then on to Gettysburg, the building of a new power house and railroad shops, and the probable extension of the trolley line from Jefferson to Brunswick.

Advices from Douglas, Ariz., state that the El Tigre Mining Co. contemplates the erection of a central power plant in Douglas, in which will be generated power not only to run the proposed new cyanide plant at the mines, but also for an electric railway which will be built from Douglas to El Tigre.

The Cumberland Valley R. R., G. C. Coons, Chief Engineer, Chambersburg, Pa., will, it is said, not only build a high line through Hagerstown, Md., and establish large yards in the southern suburbs on the Lawrence farm, recently bought by the company, but will also double track the road from Hagerstown to the Potomac River, a distance of about 12 miles, and erect a steel bridge across the Potomac river at Falling Waters.

The Board of Works of Paterson, N. J., has passed an ordinance directing that the poles and wires in the center of the city be removed not later than June, 1911. All overhead wires, with the poles carrying them, except trolley poles and arc lights, must be removed from the district bounded by the Passaic River, Spruce St., Grand St., Essex St., Straight St., and the river.

The city of Marksville, La., will vote May 14 to vote upon the proposition of levying a special tax of 5 mills for ten years in favor of the Avoyelles, Palmetto & Gulf R. R., which is projected from Opelousas through Palmetto, in St. Landry, Plaucheville, to Marksville.

Rapid progress is being made on the Great Northern R. R. line from Ayr to Surrey, N. Dak., and it is the intention of the company to have grading work finished to the terminals this Fall. Thomas Thompson is the contractor who has charge of the work in the vicinity of New Rockford, N. Dak. D. J. Hull, Jamestown, who has charge of securing right of way for the line, has experienced very little trouble, it is said.

Commercial Club of Nashville, Ark., is considering a proposition of a syndicate to build a railroad from some point in Oklahoma to that place.

Officials of the St. Louis, Iron Mountain & Southern R. R. have authorized an expenditure of $750,000 for double tracking the Arkansas Division from a point 14 miles north of Little Rock, Ark., to Bald Knob, a distance of 47 miles. E. J. Correll, Little Rock, Ark., is Engineer Maintenance of Way.

The Union Pacific R. R., A. J. Wharf, division engineer, Cheyenne, Wyo., is reported to be planning to begin work early in July on the extension of the yards, the erection of a new roundhouse, an electric turntable 105 ft. long, and the rebuilding of the freight depot at Laramie, Wyo.

Surveyors are now at work running lines for the construction of the proposed Watertown, S. Dak.,-Devils Lake, N. Dak., extension of the Chicago, Milwaukee & St. Paul R. R. It is expected the new road will be by way of Fargo, N. Dak. W. H. Penfield, Butte, Mont., is Division Engineer.

The Chicago, Milwaukee & St. Paul R. R. Co. has taken up the matter of improving the Platte line. The road bed will be partly rebuilt and other improvements made.

Property owners of Oceanville are preparing a petition urging the Atlantic City & Suburban Ry. of Atlantic City, N. J., to extend its trolley line from Absecon up the shore to Oceanville and Port Republic and eventually to Tuckerton, N. J., to connect with the railway at that point.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Gadsden has granted a franchise to Harry A. Rodgers for the building of a car line through the city. The new line is to be an interurban road running between Gadsden, Alabama City and Attalla, including the steel plant, and will also run to the Lookout mountain top. One mile of the line must be completed within six months and the whole system completed and running within 18 months. Surveys are to be made at once to determine the route to be selected in reaching the mountain. The route for the balance of the line has already been decided upon.

The Alabama, Tennessee & Northern R. R., Wm. Toxey, Chief Engineer, Cochrane, Ala., has grading work under way on its extension to York, Ala.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Timber experts of the United States government are inspecting the proposed route of the Humboldt & Eastern Electric Ry. Co., and it is believed that some definite action will be taken shortly to have active construction work started on the line. As proposed the road will extend eastward from Humboldt bay for 175 miles to the upper Sacramento valley. Seventy miles of the road will extend through the Trinity national forest in Humboldt, Trinity and Shasta counties. Brouse E. Brizard, H. L. Jackman, W. S. Clark and Ed Bond of Eureka are interested in the railroad.

H. I. Gray has placed a large canal ditcher at work on his contract for digging the main ditch of the Sacramento Valley Irrigation Co., from where it leaves the river near Willows to the Bayless camp, a distance of over 12 miles.

The Twin Peaks Tunnel Convention mentioned in our last issue as being organized at San Francisco to secure the building of a tunnel through the Twin Peaks has opened permanent headquarters at the office of Secretary C. F. Adams, 832 Mills building, San Francisco.

Engineers have been at work in the vicinity of Suisun and Fairfield surveying the right of way for the proposed electric line of the Vallejo & Northern R. R.

R. C. Williams of Sacramento is interested in a project for the construction of a new suburban electric line at Sacramento, connecting with the J. St. extension at Cutter Ave. and extending along Cutter Ave. to the M St. road, thence across Homestead to a tract of land owned by him thence to Elmhurst and terminating on the Upper Stockton Road in front of the Gerber residence.

Advices from Truckee, Cal., state that surveyors are now employed laying out a new route for the Southern Pacific curves between that city and Reno. Stakes are being placed for cuts, fills and tunnels.

The Southern Pacific Ry. Co., it is said, will extend the branch line from Lodi to Valley Springs on to the mountains. William Hood, San Francisco, Cal., is chief engineer of the company.

Among the improvements included in the number for which the Atchison, Topeka & Santa Fe R. R. Co., has appropriated $15,000,000, is the construction of yards at Calloway, Cal., and the double tracking of the line from Albuquerque, N. Mex., to San Francisco, Cal.

The Sacramento Belt Line Co. is soon to commence the construction of wharves and warehouses on the Sacramento River in Washington, opposite Sacramento, and the building of a railroad to connect them with the various railroads in Sacramento.

The Imperial Valley Ry Co. of Redlands has been incorporated with a capital stock of $2,000,000, of which $75,000 has been subscribed, and proposes the building of a number of lines of railroad through the Imperial Valley. The plans propose the building of about 70 miles of road as follows: A railroad from Imperial City to a point about seven miles to the east. Another branch will be built from Imperial to the town of El Centro, over the most direct route available, the estimated length being four miles. Another branch will begin at El Centro and extend to a point about twelve miles southwesterly. A branch will begin at the town of Brawley and extend northwesterly for a distance of ten miles. A line beginning at Brawley will extend about seven miles easterly. From Holtville a branch will be built to a point about twelve miles northerly, and to connect at Holtville with the easterly line of the road last mentioned. A line will begin at Holtville and will run nine miles in a southeasterly direction. Calixico will be the beginning terminal for a line to Mellowland. This line will be 14 miles in length and will extend in a northeasterly direction. W. F. Holt, Redlands, Cal., is President.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

R. L. Richmond has been awarded the contract for the earth removing work on the McCall reservoir for the city of Longworth.

The C. G. Sheely Construction Co., Denver, has work well under way and will complete the construction of the Halligan dam for the North Poudre Irrigation Co. of Fort Collins, so that it can be formally opened for use by May 31. The dam is located on the north fork of the Cachela Poudre river, 12 miles north of Livermore. It is 335 ft. in length, with a width of two ft. at the top and 34 ft. at the bottom. Its height, from the lowest outlet to the top of the spillway, is 69.8 ft. The construction is of cyclopean masonry.

E. E. Van Diest, of Colorado Springs, is drawing plans for a storage reservoir to be constructed on property owned by the Myron Stratton Home, just south of Colorado Springs, on the site formerly occupied by the old Broadmoor dairy building. The reservoir, which will be utilized to irrigate land surrounding the Myron Stratton Home buildings, will impond 600 acre feet and will cost between $20,000 and $25,000.

D. D. Morgan has been awarded the contract for grading two miles of the Laramie, Hahns Peak & Pacific R. R., at Hebron, Colo. Contracts are being carried out in the grading of the line for several miles west of Foxpark, Wyo., and the company expects to award the remainder of the grading within the next few weeks and complete the work to Hebron this year. J. J. Argo, Laramie, Wyo., is chief engineer.

The Denver, Laramie & Northwestern Ry. Co. is now laying track on the line from Milliken to Greeley, Colo., a distance of 15 miles and it is expected to have trains in operation by May 15.

The Colorado & Red Canon Railway Co. has been incorporated at Denver, Colo., with a capital stock of $600,000 and proposes the construction and operation of a railroad in this state. The incorporators are N. J. Olsen, George C. Harp and W. M. Foster, Hotchkiss, Colo.

Advices from Greeley, Colo., are to the effect that all work will be completed on the Union Pacific's Pleasant Valley branch by May 15. The grading outfit will then be shifted to the Cow Creek branch.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Plans are under way, it is said, to combine two railroad projects in South Georgia, consisting of the line for which charter has been granted from Waycross, through Bexley to Vidalia and the proposed line from Wrightsville through Adrian to Vidalia, thus giving a through line from Wrightsville to Waycross, Ga. The promoters are to take up the matter of constructing an extension to St. Marys from Waycross.

The Augusta, Lincolnton & Northern R. R. Co., has been granted a charter to construct a 100-mile railroad from Augusta, Ga., through Richmond, Columbia, Lincoln, Oglethorpe and Madison Counties, connecting Augusta with Lincolnton, Tignall, Washington and Danielsville. The incorporators are as follows: Samuel L. Wilkes and J. C. Groves, Lincolnton, Ga.; John J. Wilkinson, C. D. Bolton and Thomas W. Hill, Wilkes, Ga.; Thomas L. Verdel, W. A. Swift, T. M. Swift, Jr., and Z. C. Hayes, Elberton; E. N. Cobb, Athens, Ga. The shares are in $100 denomination and all common stock.

The Waycross & Southern R. R. has applied for a charter to construct a line south and southwesterly from Waycross, Ga. The company has a capital stock of $100,000 and headquarters at Waycross. The incorporators are as follows: James W. Oakford, of Scranton, Pa.; Daniel L. Hebard, of Piquaming, Mich.; Bryan Cumming, of Summerville Richmond county, Georgia; Chas. S. Hebard, of Thomasville; F. L. Space, of Forty Fort, Pa.; Walter Briggs, of Scranton, Pa.; R. R. Hopkins, of Brunswick; Stanley Manness, J. M. Hopkins and B. W. Redding, of Waycross.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Caldwell-Roswell-Big Bend Interurban Ry. Co. has filed its articles of incorporation at Caldwell, Idaho. The capital stock is $250,000 and the incorporators are: W. P. Howard, J. H. Lowell, Harvey Hatch, Thomas Walsh of Roswell, Robert McGuire, James Garfield, H. W. Dorman, Elmer A. Clark and B. M. Holt of Caldwell.

Illinois parties, including Capt. Henry C. Garvin of Springfield, Ill., and Charles Ullrich, of Springfield, are investigating the feasibility of financing an electric railroad to connect the towns of Albion and Burley.

The Northern Pacific Ry. has again sent its engineers to the Bitter Root Mountains and a crew is now engaged on the first 40 miles of line that is to be constructed this year, towards Lewiston.

According to reports from the vicinity of Ida Grove, Idaho, the Chicago & Northwestern R. R. is planning the construction of a line from Odebolt to Cushing, in order to shorten the distance between Des Moines, Ia., and Sioux City. H. Rettinghouse, Boone, Ia., is division engineer of the railroad company.

Officials of the Oregon Short Line R. R. have ordered tracklaying to start immediately on the branch line from Moreland, to Pingree, Idaho. G. H. Trout, Pocatello, Idaho, is assistant engineer of the company.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Rock Island Southern Ry. is considering continuing its stub line from Aledo to Viola. The matter of building a stub line to Alexis is also under consideration.

C. W. Gindele Co., Chicago, Ill., has been awarded the contract for the construction of a 10-stall round house at Nelson for the Chicago & Northwestern Ry. G. P. Connell has the contract for grading for the switch tracks at Nelson, as well as for the grading work at Fulton.

The Elgin, Joliet & Eastern Ry., A. Montzheimer, Chief Engineer, Joliet, Ill., is to expend approximately $3,000,000 for improve-

ments. Some of these are already under way. Contracts for grading for second track work were awarded recently as noted in our last issue. The improvements include the following: New roundhouse in East Yards at Joliet; new brick freight house in Joliet; new side track to accommodate 1,000 cars; entire renovation of East Joliet shops; replacing all worn rails over entire system; double roadbed on entire Eastern division; new roundhouse at Waukegan; extensive improvements on the Southern division; yard improvements at Gary and Waukegan; enlargement of sidings at Coyne's Station, Walker, Normantown, Frontenac, Warrenhurst, Sutton and Bennington.

The Wood River Drainage Commission has filed its report with the County Court at Edwardsville. The improvement proposed is to clear the old channel of brush and trees and to cut a straighter channel. Levees will be constructed in some places to prevent overflows. The estimated cost of the work is $287,000.

The Bromwell Construction Co. has begun work on its contract for the concrete construction in connection with the track elevation work of the Santa Fe in Joliet.

Officials of the Chicago, Milwaukee & St. Paul R. R. are considering the elevation of its tracks within the city limits of Elgin, Ill. Edward Laas, Fullerton Ave., Chicago, Ill., is Engineer Maintenance of Way of the C., M. & St. P. Ry. Co.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hammond, Whiting & East Chicago Ry. Co. proposes to lay double track on Schrage Ave., and to pave its right of way through Whiting.

Right of way is being secured for a proposed electric railway between Bremen and Mishawaka. Application has been made to the Town Trustees of Bremen for an entrance to that city, and application has also been made to the County Commissioners. The line will be about 16 miles long and is to be constructed this summer. Omar E. Neff, Milford, Ind., is interested.

The Commissioners of Henry County, New Castle, Ind., are considering petitions for dredging Fall Creek for a distance of about 11 miles. It is estimated that the work will cost $75,000 to $100,000.

It is now said that the proposed interurban line from Newcastle to Muncie, Ind., will be built this year. This branch has been projected for about seven years and it is said that the original promoters will be able to finance the project. E. T. Ice, Muncie, Ind., is interested.

The U. S. Steel Corporation has asked Congress for permission to fill in several hundred acres of submerged lands in Lake Michigan, at Gary, with a view to building a large harbor for the unloading of ore boats. The plans include several piers 2,500 ft. long on which railroad tracks will be extended in order to permit transfer of the ore directly from the boats to cars.

Entire right of way for the South Bend & Logansport Line has been secured and arrangements made with the Baltimore & Ohio R. R. Co., to cross their line at Lapaz and the Wabash Railroad at Lakeville, Ind. Harry A. Butterfield, Goshen, Ind., is doing the grading.

John T. Adams, the railroad contractor of Columbus, O., who was in charge of the construction of the Indianapolis, New Castle & Toledo Traction Co. line from Newcastle, Ind., to Indianapolis, Ind., to a connection with the Belt Line Ry., has completed the contract and moved his outfits to other points.

Rapid progress is reported by the men engaged in constructing the fourth track on the Lake Shore System, and it is expected that the line will be completed to Chicago by the first of July. The fourth-track system is already in operation between Toledo, O., and Elkhart, Ind.

The project for the Wabash & Rochester Interurban Ry., which failed after $110,000 had been voted in subsidies, has been revived. Representatives of the Winona Interurban Co. have been along the line and will ask a subsidy, it is said, and connect this line, if successful, with the former line. Nine miles of the Winona road could be used, the extension being built from that strip on to Wabash and thence to Rochester. The old property will be sold at receiver's auction.

Engineer Pastelle, of Chicago, Ill., President of the Northwestern Indiana Traction Co., has applied to the City Council of Hammond for a franchise. The company is reported to have secured the necessary capital for beginning construction work as soon as the franchise is received.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Sioux City & Eastern Interurban Ry. Co. has filed its articles of incorporation at Sioux City. The project is backed by farmers in the vicinity of Climbing Hill. and as proposed the line will come into Sioux City via Battle Creek, Climbing Hill and Ida Grove. The company has a capital stock of $100,000. W. L. Harding, Sioux City, is attorney for the company and the incorporators are A. H. Tennis, H. C. Fedderson, W. B. Goodrich, C. S. Malcom, W. H. Steinhauer, William Hainer and W. L. Harding.

It is reported that contracts have been let and that construction work will be started in June on the first section of the South Dakota Interurban line west from Sioux City. This road was formed to build a line from Sioux City, Ia., to Pocatello, Idaho, a distance of 800 miles. For that length the line will be electric, using electric motors. From Pocatello to the Pacific Coast connection is made with steam lines already in operation. It is proposed to erect a large power house every 75 miles. The plans include large steel bridges to be built over the Sioux, Jim, Vermilion and Wind rivers. Capt. C. J. Dubois, Macon, Mo., is chief engineer.

George D. Dobson, of Des Moines, Secretary of the State Drainage, Waterways and Conservation Commission, who has just completed a survey of the Boone River from Webster City to its mouth, has reported that the fall of the Boone river is sufficient to develop water power enough to supply the power and light needs of Webster City.

The Chicago Great Western Ry. is reported to have acquired control of the St. Paul & Des Moines R. R., which has 121 miles of line in operation. It is said that Mason City will be made a division point between St. Paul and Kansas City.

The Chicago, Rock Island & Pacific Ry. is to expend $25,000 to $30,000 in building more sidings in its yards at Waterloo. The Chicago, Great Western R. R. is also planning to enlarge its yards at that city.

The Chicago Great Western R. R. has been making preliminary surveys in the vicinity of Waterloo for the purpose, it is said, of building a cutoff in connection with the plan for shortening the main line at various points between Oelwein and Kansas City.

Surveys have all been completed for the proposed line of the Muscatine North and South R. R., mentioned in a recent issue of Engineering-Contracting, and construction work will be started some time this spring.

Engineers are reported to be working north from Denison on surveys for a proposed interurban line from Sioux City to that place. A company has been incorporated at Sioux City with a capital stock of $100,000 to build the proposed line.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Midland Valley R. R., C. Kaighn, Engineer, Muskogee, Okla., is said to be considering extending its line from its present terminus at Arkansas City to the northwest. The route, according to reports, is by the way of Oxford, Wellington, Wichita and direct to McPherson, where it will connect with the Union Pacific.

The Gulf & Northwestern Ry. has been having resurveys made of its proposed line to ascertain the most practicable route with a view to final location. At a recent meeting of the stockholders of the company at Cheyenne, Kan., the following officers were elected: James A. Sprague, vice president; J. A. Keernan, secretary; J. F. Kimmel, treasurer, and C. C. Fodman, general manager.

The Chicago, Rock Island & Pacific Ry. has bought 14½ acres of land at Wichita for its new freight yards at that place. About $200,000 will be expended on the improvements, which will consist of a 5-stall roundhouse, a power plant, water tanks, coal chutes, cinder pits, car repair shops and tracks. A track extending from the roundhouse to the southern limits of the city will be built for the passing of long freight trains.

Officials of the Atchison, Topeka & Santa Fe R. R. Co. have accepted plans for the relocation of the line between Lake View and Lawrence, Kan., which was washed out by the new river channel. According to the new surveys the work will necessitate the raising of the grade 6 ft. for a distance of two miles, but will save about 1,000 ft. in distance. Grading will be commenced within a short time, it is said. J. M. Meade, Topeka, Kan., is Engineer of the eastern lines of the Atchison, Topeka & Santa Fe Ry.

J. B. Piper, a former real estate man of Omaha, Neb., proposes the construction of a direct railway line from Wichita, Kan., to that city.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Louisville, Lincoln Farm & Mammoth Cave Traction Co., has securred franchises and right of way for its projected electric interurban line between Glasgow, Ky., and New Haven, Ky., over the L. and N. turnpike, with auxiliary lines from Buffalo, Ky., via Lincoln farm, to Hodgenville, Ky., on the Illinois Central Railway, and to Mammoth Cave, head of navigation on Green River. The company was chartered some time ago and arrangements are now under way for financing the project. J. M. Richardson, Glasgow, Ky., is president and J. Ward, Glasgow, Ky., is secretary.

Advices from Carlisle, Ky., state that the Louisville & Nashville R. R. is planning, among other improvements, the extension of its lines into Nicholas County and the double tracking of its main line from Cincinnati to Butler and the construction of a line from the latter place through Pendleton, Robertson, Nicholas and Bath Counties to the Morgan County Coal Fields.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The towns of Plaucheville, Moreauville and Longbridge, La., have voted a 5-mile tax for ten years in favor of the Avoyelles, Palmetto & Gulf R. R. The tax which has been voted will yield $30,000 annually. The Avoyelles, Palmetto & Gulf R. R. is projected from Opelousas, to St. Landry Parish, La., to Marksville, through the towns of Port Barre, Plaucheville, Moreauville and Mansura. An election has been ordered and will soon take place in Marksville on the question of a tax in favor of the road. No opposition of any consequence has developed as yet.

The Progressive Union of Hammond, La., has taken steps to organize a company for the construction of a motor line between Hammond, Natalbany and Genesee.

Plans are on foot to drain more than 35,000 acres of prairie land lying between Bayous Terrebonne and Lafourche, in the Parishes of Terrebonne and Lafourche, and taking in the Bayou Blue country. The drainage district will start from a point north of Houma, and terminate at a point northeast of Schriever, including lands of the Acadia plantation.

The Payne Investment Co. of Omaha, Nebr., is reported to be negotiating for the purchase of 50,000 acres of unclaimed land in Terrebonne Parish and St. Mary Parish.

The Natchitoches & Southwestern Ry. Co. is said to have preliminary matters well along, so that actual construction work can be started

soon. Capt. C. H. Teel, Colfax, La., is president.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A company is being organized in Kalamazoo, according to reports from that city, for building an electric railroad from Kalamazoo to Otsego, via Plainwell. The line would be about 15 miles long. George E. Bardeen, Otsego, is interested.

Officials of the Chicago, South Bend & Indiana Ry. Co., which recently acquired the Southern Michigan Ry., has given assurances that the proposed line to Dowagiac will be built as soon as possible. The Dowagiac line is a part of the proposed Kalamazoo extension of the old Southern Michigan company. If the Dowagiac division is built it is probable that the full distance will be accomplished at some future day. The line would reach Decatur, Lawton and Paw Paw lake beyond Dowagiac. Samuel Murdock, Lafayette, Ind., is secretary.

The Michigan United Rys. Co. has petitioned the City Council of Detroit for a 30-year, eight-for-25 cents fare franchise to operate street cars from the western limits to the center of the city. It proposes, if it is successful in securing an entrance to Detroit, to extend its interurban service from Jackson by way of Ann Arbor.

The Grand Trunk Ry. is reported to have acquired control of the Detroit & Mackinac R. R., and is said to intend to extend the line across the upper peninsula, over the border line and back into Canada.

L. J. Weadock, of Toledo, O., and J. Harry Kinesly, Jr., of Cleveland, O., are promoting a project for the construction of an electric line to Fenton and Long Lake, a distance of 16 miles. It is intended if the company is organized to obtain the franchises held by Chester H. Bliss of Flint, who obtained them two years ago. These franchises run for another year.

The Northern Construction Co. of Lansing has started tracklaying from Morrill on the new Lansing-Owosso interurban line.

The Village Council of Caro has granted a franchise to the Detroit, Bay City & Western R. R., to use certain streets for railroad purposes.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

W. M. and E. M. Prindle, of Duluth, have been granted a street railway franchise at Virginia, Minn. Material for the line is said to have been already ordered.

W. H. Small, of Aitkin, who has been in charge of the sub contractors for Foley, Welch & Stewart on the Cuyuna and Thief River Falls divisions of the Soo line, is soon to engage in the railroad contracting business on his own account and has taken a contract in North Dakota.

Among the dock contracts which Barnett & Record, Minneapolis, now have under way at the Head of the Lakes are the following: The Great Northern's new ore dock at Allouez, the foundation of the Pittsburg Coal Co.'s dock at West Duluth, the extension of the Zenith Furnace Co.'s dock, the extension of the Berwind Coal Co.'s dock at Superior, the foundation for the Hanna Coal Co.'s dock, heavy repairs to the property of the Northwestern Coal & Dock Co. and the dock for the Alger-Smith people at Knife River.

Options on right of way are being secured by the projected line of the Minneapolis Electric Short Line Ry. The projected line runs between Stahl and Belle lakes, its nearest point being only four miles from Hutchinson. T. D. Woodbury is chief engineer.

Advices from Mankato state that J. H. Diers, secretary and general manager of the Minnesota River Improvement & Power Co., has closed deals for the flowage rights where the various power dams are to be located. One dam is to be located at Ortonville, one at Redwood Falls and one at Lac qui Parle. The aggregate horsepower expected to be developed is 25,000.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Missouri Pacific Ry., E. F. Mitchell, Engineer of Construction, St. Louis, Mo., is preparing to have work started on the building of a locomotive and freight car repair shop in the East Bottoms at Kansas City. About $250,000 is to be expended for the purpose.

The Missouri Terminal Co. has been organized by Kansas City parties for the purpose of providing a railway entrance into the new Union Station at Kansas City from the South. Surveys have been made for a 4-track line from Martin City, which is just south of the city limits. The estimate of the construction cost is $7,000,000. The consummation of the plan is said to depend on the decision of four railways either to patronize or buy the proposed line.

The North Missouri Central R. R. Co., organized for the purpose of building an interurban electric road connecting Columbia, Mexico, Ashland, Cedar City and Jefferson City, has increased its capital stock from $600,000 to $2,500,000, and will have work on the road begun soon. The principal stockholders are O. F. Shaete, A. J. Estes, Turner S. Gordon and Jos. M. Estes, all of Columbia, Mo.

St. Louis Items.

BY A. B. KOENIG.

Harrington Bros., at Waverly, Ia., have 60,000 yards of machine work on the Waterloo Cedar Falls & Northern Railway to let. They want to place a 15 or 20 team outfit on this job.

J. J. McInerney got in on a nice piece of work on the Chicago, Milwaukee & St. Paul Railway at Gracehill, Ia.

Harry Fell of Petersen & Fell, the Boarding Contractors, reports opening several new camps on the Missouri Pacific R. R. during the past week.

Contracts for 927,000 cu. yds. of levee work were awarded at a special meeting of the board of Mississippi levee commissioners at Greenville, Miss., on April 27th. Roach & Stansell, of Memphis, were awarded the contract for work at Riverton, in Bolivar county, calling for 527,000 cubic yards at 21.25 cents per cubic yard. Dulaney & Foote will build in sections 1 and 2 at Shiloh. Their contract includes 252,000 cubic yards at 16 cents per cubic yard. Clarke, Gibson & Co. were awarded the contract for the work in section 3 at Shiloh. They will build 148,000 cubic yards at 16.40 cents per cubic yard.

McCann Bros. are about through with their work and have 26 teams idle at Murphysboro, Ill.

Hodges Downey & Co. have opened an office here in room 336 Pierce Bldg. Mr. W. D. Allen, who formerly was in the Principal Assistant Engineer's office of the Missouri Pacific R. R., is now with the above firm and in charge of this office.

Pat McCadden is at work at Gale, Ill.

The L. J. Smith Construction Co. bought two more big locomotives last week. This makes a total of 45 that they have at work on their contracts on the Missouri Pacific and Santa Fe R. R. This company probably has more locomotives at work than any one contracting company in the country at the present time.

Mike Conroy has moved his outfit to Stockton, Ill., where he is grading the G. W. yards. Mike says he has enough work there to hold him at least three months.

Col. T. J. Dolan, Secretary of the Steam-Shovel & Dredge, spent last Saturday in town. Dolan reports a scarcity of Steam-Shovel operators and wages going up. We have noticed the scarcity in St. Louis for over a month ourselves and it has been almost impossible to hire a steam-shovel man around this part of the country at any price. Steam-Shovel contractors bidding on new work want to bear this in mind.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Location surveys have been completed for the line of the Virginia City Southern Electric Ry. Co. from Virginia City to Alder, 9.6 miles. Grading work is to be started this month. George F. Douglas, Madison House Block, Virginia City, Mont., is chief engineer. The contract for the work is reported to have been let.

Advices from Lewiston state that S. W. Gebo will soon have work started on his proposed electric road to Kendall. He has adopted the survey made some six years ago by City Engineer O. F. Wahmansdorff of Lewistown, for John L. Bright.

John Capp, a grading contractor, who has been working on the line of the Gilmore & Pittsburg R. R., has removed his outfit to Three Forks, where he will commence grading on the proposed electric line from Three Forks to Salesville in the Gallatin valley.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Jay Street Connecting R. R., of Brooklyn, proposes to extend its route for a distance of 1,453 ft. in that city.

The state legislature has passed the bill regarding the New York city debt limit. This bill makes $47,000,000 available for new subways in New York City.

The Advisory Board of Consulting Engineers for the New York State Barge Canal has considered favorably the plans for these proposed contracts for barge canal construction: Contract 62, for constructing 14 miles of canal in Orleans and Monroe counties, estimated cost $2,150,000. Contract 79, for highway bridge at Oswego, estimated cost $40,000. Contract 50, for construction of big dam for Hinckley reservoir at West Canada Creek, area of reservoir six miles, estimated cost, $1,076,000.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club of Marion has appointed a committee, of which J. E. Phillips, Marion, is chairman, to raise a fund of $1,000 as its share towards having surveys made for an interurban line from Mt. Vernon to Marion and Mt. Gilead. The Roberts & Abbott Co. Engineers, Cleveland, O., will be in charge of the surveys.

The Inland Waterways Improvement Co., of Ashtabula has been incorporated with a capital stock of $10,000, the incorporators being Harry Allehin, W. L. Vance, V. E. Davis, A. S. Baker and Walter S. Sapp. This company has been awarded the contract for improving Ashtabula Creek at Ashtabula. The contract price was $281,000, as noted in our last issue.

A considerable amount of tunnel work is proposed for the Hocking Valley R. R., which is now controlled by the Chesapeake & Ohio Ry., H. Pierce, engineer of construction, Richmond, Va. The first of these will be 2,200 ft. long and will be built in the vicinity of Wellston.

The Lake Shore & Michigan Southern Ry. has begun work at Amherst on the fourth track between Elyria and Vermilion. The four tracks between Elyria and Vermilion are expected to be in operation by April, 1911. About five of the nine miles of fourth track has already been built. Workmen are also making preparation to extend the four tracks from Vermilion to Sandusky.

Reports state that work is to be resumed shortly on the construction of the Lorain & Ashland line and it is said that the prospects are favorable that the road will be extended from Wellington to Ashland. This line was promoted by Joseph Ramsey, Jr., 212 Broadway, New York.

The Minster-Loramie Ry. Co., which proposes to build a three-mile extension of the Western Ohio Electric Ry. from Minster to Loramie, has decided to issue $45,000 worth of bonds. The citizens of Loramie have subscribed for $5,000 of these bonds and it is

expected that Minster and New Bremen will take up the rest. Surveys have been made and the track will be laid by fall.

A public hearing was held at Lorain on April 28 by the U. S. Engineer, Col. John Willis, on the request of the B. & O. for the right to extend its property 500 ft. square by filling in the lake just west of the west government pier at Lorain. The company plans to make extensive improvements and to use this made land for storage purposes.

Engineers have been making estimates as to the cost of rebuilding the Maumee-Waterville line of the Maumee Valley Railway & Light Co., which was badly damaged by an ice jam the latter part of February. Nearly one-half the road is said to have been practically destroyed, and the expense of rebuilding, at best, will be very heavy. No decision will be made as to the rebuilding until the engineers have completed their work. Albion E. Lang, Toledo, O., is President.

J. C. Rothery, general manager of the Ohio Valley scenic route, comprising the East Liverpool Traction & Light Co., the Steubenville & East Liverpool Railway and Light Co., and the Ohio River Passenger Railway Co., has resigned to accept a position as general manager and manager of constrction of new electric railway properties to be constructed in South America.

The stockholders of the Chesapeake & Ohio Ry. have authorized an increase of the capital stock to $100,000,000. The stockholders also authorized an issue of $37,200,000 20-year 4½ per cent convertible bonds. The bonds are issued, it was stated, to provide funds for the acquisition of a majority of the common capital stock of the Hocking Valley Ry. Co. and of a substantial interest in the capital stock of the Kanawha & Michigan Ry. Co., and for general improvement purposes.

Work, it is reported, will be started on the double tracking of the Oil City branch of the Lake Shore railroad from Andover to Franklin, O. The first section to be constructed will be 28 miles in length, from Polk Junction to Sand Lake, for which an appropriation has already been made.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the Wichita Falls & Northwestern Ry., R. A. Thompson, chief engineer, Wichita Falls, Tex.. have completed their survey in Comanche and Tillman counties and have been ordered from Frederick to Hollis, where they will take up and finish a survey of the line to Wellington, Tex. The old Kentucky roadbed from Altus to Hollis will be used, with a few slight changes from Hollis to Wellington. In Comanche County the final survey gives a direct line into Lawton.

According to a statement of President J. M. McDonald, Kansas City, Mo., grading work on the proposed Denver, Kingfisher & Gulf Railroad is to begin out of Oklahoma City early this month. It is planned that the interurban service between Oklahoma City and Kingfisher shall be in effect by January 1, 1911, and that the entire road will be completed by January 1, 1912. The shops are to be located four miles west of Oklahoma City and will occupy a tract of 480 acres of land.

Officials of the Fort Smith & Western R. R. have been over the route of the proposed extension to the southwest from El Reno, Okla. The stockholders of the road have approved the extension and it is said that actual construction work will be started shortly. W. M. Bushnell, Fort Smith, Ark., is general manager.

The Gulf Pipe Line Co., John S. Fisher, General Superintendent, Bartlesville, is considering building a 52-mile extension of its pipe line into the fields of Northern Oklahoma.

Work is now under way on the interurban switch which will place Haileyville, Okla., on the main line of the McAlester-Hartshorne Ry.

According to advices from Watonga, Okla., surveyors of the Mountain, Valley & Plains R. R. Co. have completed a preliminary survey for the line between Fountain and Kingfisher and are now running another line between the two points, in order to find a lower grade than the first, which is considered too high for railroad purposes by the engineer of the company.

Advices from Waynoka, Okla., state that the Santa Fe terminals and shops will be moved from La Junta, Colo., to that place and that work will be started at once to make that place one of the finest division points on the road southwest.

Work has been started on the construction of the Kansas, Lawton & Gulf R. R. Company's projected line from Oklahoma City to Wichita Falls, Tex.

The Atchison, Topeka & Santa Fe Ry. Co. has work well under way ballasting and raising the track on the line between Cherokee and Kiowa, Okla.

The recent sale of $3,000,000 of the Missouri, Oklahoma & Gulf Rys. bonds in Paris, France, is said to assure the extension of the line from the present terminus at Wagoner, Okla., to Kansas City, Mo. At present the road is operating a line about 200 miles long through Oklahoma. The company is constructing a track from Durant, Okla., the present southern terminus, to Dennison Tex., about 28 miles south, and it is expected trains will be running on the new extension by Aug. 15. J. J. Harrison, Durant, Okla., is Chief Engineer.

As a result of the recent meeting of the Atchison, Topeka & Santa Fe R. R. directors in Chicago, Ill., an appropriation of $300,000 was made for the construction of yards and terminals in Oklahoma City, Okla., and actual work will be commenced shortly. The capacity of the yards will be increased from 900 to 2,000 cars. J. M. Meade, Topeka, Kan., is Engineer of the Eastern Lines of the Santa Fe.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The surveys of the Albany & Interurban electric line from Albany to Sweet Home by way of Lebanon and the South Santiam Valley have been completed and the surveyors have begun the survey of the line to Sweet Home by way of Brownsville and the Calapoola River Valley. The work of securing rights of way is progressing steadily.

The City Council of Marshfield is planning to order all the lowlands in South Marshfield filled. Many blocks in the south part of the city are on what was tidelands, the buildings being erected on piling.

H. C. Henry, Seattle, Wash., has been awarded the contract for grading the Oregon Trunk Line from Madras to the north boundary of the Klamath Indian reservation. The contract calls for completion by Jan. 1, 1911. The grade will be 123 miles in length and runs over comparatively smooth ground. A few bridges will have to be put in, but the large bridge across Crooked river will be built by the railroad company under supervision of Engineer Ralph Modjeski of Chicago, Ill. The bridge will be a steel arch.

The Pacific & Eastern Ry., of which John R. Allen is president and Wm. Gerig, chief engineer, Medford, Ore., has offered to build a railroad to the Blue Ledge Mine, 30 miles southeast of Jacksonville, if the Commercial Club of Jacksonville would secure a right of way.

The Portland, Eugene & Eastern Ry. Co., operating a street railway line in Eugene, Ore., has made a proposition to the members of the Northwestern Eugene Improvement Club to build a loop two miles in length to the western end of the city for a bonus of $12,000.

Over 1,000 men are now employed on the extension of the Pacific & Eastern Ry. through Rogue River Valley, and it is expected to increase the force to 5,000, if the men can be secured, so as to get the road completed across the Cascade Mountains before the next winter season is on. Grading camps are strung all along from Eagle Point to within 2½ miles of Butte Falls, a distance of 23 miles. and the right of way is cleared to Butte Falls. Two large steam shovels are a part of the equipment, and as no heavy rock work is being encountered and there is no tunnelling to do, it is expected to have the road completed to Butte Falls by June 15. Wm. Gerig, Medford, Ore., is chief engineer.

The Southern Oregon Railroad & Power Co. has been organized and is to build an interurban line through the Rouge River Valley. Wm. Gerig, Medford, Ore., is reported to be interested.

The Tri-State Railway & Power Co., of Portland, has been incorporated with a capital stock of $10,000, the incorporators being W. D. Riddell, R. B. Candage and T. M. Peters.

Advices from Sweet Home, Ore., are to the effect that work on the railroad between Albany and Cascadia has begun at Albany. The line as projected will pass through Sweet Home.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Plans have been completed by the West Penn Railways Co. of Pittsburg for the building of a branch line from Greensburg to the Jamison coke works and thence to Latrobe, a distance of 10 miles. The West Newton & Hunter line will be built during the coming summer. P. O. Fritsch of Connellsville is chief engineer.

The Cumberland Valley R. R., G. C. Coons, engineer, Chambersburg, has been making several surveys through and around Shippensburg, and this has led to the report that the railroad intended to enter the town by another route.

Advices from Butler, Pa., state that the Slippery Rock and Grove City Street Railway Co., projecting a line between Slippery Rock and Grove City, Pa., has filed a mortgage for $250,000 to finance the work.

The Council's Committee on steam railways of Philadelphia has approved the plans of the Reading Railway Co. for the construction of a low-level single line of freight track paralleling the company's New York division road for a distance of about one mile between Wayne Junction and Logan Station. The new track is to relieve this section of the New York division of the heavy freight from the Wayne Junction freight yards. Wm. Hunter, Philadelphia, is Chief Engineer.

The Stone & Webster Engineering Corporation, Boston, Mass., is to determine upon a route for a connection of the line of the Philadelphia & Western Ry., and the Lehigh Valley Transit Co. Both roads are controlled by E. B. Smith & Co., Philadelphia.

An ordinance is before the Councils of Scranton, to permit the street railway company to extend the Swetland St. line north on Bromley Ave. to Pettebone St., west on Pettebone St. to Rebecca Ave., and possibly north on Rebecca Ave. to Schlager Boulevard.

The Lowe Construction Co. of Bristol, Tenn., has been awarded a contract by the Doe River Light & Power Co. which is to supply the Bristol Gas & Electrical Co. with current, for the construction of a concrete dam across the atauga River in the Horseshoe Bend in Carter county. The dam will have a base 48 ft. in width and will be 50 ft. in height and 300 ft. in length. The contract price is said to be $250,000.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress is being made by the committees of the Commercial Clubs of Greenville and Wolfe City in securing right of way for a projected interurban line between the two towns. J. B. Murphy, Greensville, is interested.

R. T. Gunn, representing Chicago capitalists, has made a proposition to the city of Waco for building an interurban line between Waco and Temple. James B. Baker of Waco, acting as chairman of the Business Men's Club, has offered right of way from Waco to the county line, and a similar offer has been made by Temple.

W. A. Frisby, Beeville, promoter of the proposed Beeville-to-the-West railroad, has made a new proposition to the citizens of Beeville. He now offers to make a guarantee

bond with a Philadelphia bank to complete the construction to the Rio Grande, 175 miles, inside of 48 months, or forfeit all claim to the bonus and other conditions demanded of Beeville.

The Myrick Brothers Shell Co., Port Arthur, has contracted to furnish the Kansas City-Southern Ry. 50,000 yds. of oyster shells. The track is to be ballasted with these shells to the Sabine river and all the yards at Beaumont and Port Arthur and the Port Neches switch. New ties are being placed in readiness for the work. Beyond the Sabine river the ballasting will be continued with gravel.

The Atchison, Topeka & Santa Fe Ry. has plans under way for increasing the capacity of its yards at Cleburne so that they will hold 20,000 cars. About $400,000 will be expended there.

The Austin Dam & Suburban Ry. Co., T. J. Freeman, Houston, president, contemplates the construction of a motor line from Austin to the dam site near that city.

The New Orleans, Texas & Mexico R. R. (Frisco system), M. C. Byers, Chief Engineer, St. Louis, Mo., is to construct a branch line from Kingsville to the town of Riviera on the Gulf of Mexico.

The Quanah, Acme & Pacific Ry., C. E. Ensminger, General Manager, Quanah, mentioned in our last issue, has engineers in the field surveying the route for the proposed extension to Roswell. It is now announced that construction work will be started from Paducah the latter part of this month.

The town of Eola has raised a bonus of $34,000, which will be increased to $75,000, for the purpose of securing a railroad from San Antonio.

Citizens of Anson, Tex., are taking the matter into consideration of subscribing a bonus amounting to $40,000 and furnishing the right of way for the construction of a railroad from Anson to Hamlin, Tex.

Reports from Asherton, Tex., are to the effect that the Asherton & Gulf R. R. Co., is considering the extension of its line from that city to Eagle Pass, Tex., a distance of 75 miles. R. H. Gresham, Artesia, Tex., is Chief Engineer.

Arrangements have been completed for the financing of the Bartlett-Florence railroad extensions: One from Florence to Pampasas, 25 miles, and the other from Bartlett southeast to a point near Houston, 160 miles. G. D. Fairtrace, Bartlett, Tex., is Chief Engineer of the company.

Track has been laid at Haskell to Hemphill park for the street railway. It is said to be the intention of Promoter Hemphill to continue the system into a belt line.

The Paris & Mount Pleasant R. R. has let a contract for 25 miles of new 60 lb. rails. Nearly all of the grading has been completed and it is proposed to have the track laid to Sulphur by Sept. 1.

Plans and drawings for the proposed extension of the car lines in the southeast portions of Houston have been forwarded to the Boston headquarters of the Stone & Webster Engineering Corporation for approval and are expected back in Houston about May 20.

Plans are under consideration for reclaiming the plat at Morgan's Point, near Houston, and bringing it up to grade preparatory to establishing a summer resort there. It is said that $100,000 will be spent in grading and improving the land. Joseph F. Meyer, Houston, is interested.

The Gulf, Colorado & Santa Fe Ry. has awarded contracts for the erection of two of the bridges necessary to the building of the Lometa-Brady extension of the road in West Texas. The successful bidder was the Union Bridge & Construction Co. of Kansas City, Mo., and the work will be started at once. The contracts call for concrete and steel construction, one being across the Colorado River 14 miles west of Lometa.

Contracts have been signed providing 50 miles of right of way for the proposed branch line of the Kansas City, Mexico & Orient Ry., from San Angelo to Allende, Mex. It is expected that right of way and liberal bonus will be donated to the company for the 75 miles of line to be constructed across the Mexican Territory. The road will cross the Rio Grande River at Del Rio, where a large international bridge will be constructed. Plans for the work have already been made. C. H. Webster, Sweetwater, Tex., is Chief Engineer of the company.

Work has been started laying steel on the projected line of the Enid, Ochiltree & Western R. R., out of Dalhart, Tex. It is thought that no further interruption will delay the work.

Millersview, Tex., has been called upon to subscribe a bonus of $40,000 to aid in the construction of the proposed Santa Fe branch line from Ballinger south to that town, a distance of 25 miles.

The Stephensville North & South Texas R. R., operated as part of the St. Louis Southwestern System, has filed an amendment to its charter providing for the construction of three extensions and branch lines as follows: One from Hamilton to Gatesville, 32 miles; from Stephensville to Thurber, 26 miles; from Hamilton to Comanche, 35 miles. Surveys for the new work will then begin. B. C. Cage, Stphensville, Tex., is President of the company.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Western Pacific Ry. has been making surveys for a line around the south end of the Great Salt Lake. This line starts at Grant's and skirts the dry land on the edge of the lake to the old salt mill of Thomas Weir, thus cutting out the five miles or more most susceptible to damage from high winds on the lake. The breakwater will also be built and the present line is being quickly repaired.

Construction work has been started on the proposed extension of the Utah Light & Railway Company's extension to Midvale and it is expected that the track will be laid complete by June 1.

The Beaver Irrigation & Power Co. is planing to put 50,000 acres of land in Beaver county under irrigation and will expend about $1,000,000 for installing reservoirs in the Beaver river. B. F. Walling & Co., Chicago, Ill., and St. Paul, Minn., are interested.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lynchburg, Amherst & Northern Ry. is to have preliminary surveys started shortly, for its proposed trolley line from Lynchburg, Va., northward through Amherst county and into Nelson county. The line will start at the northern end of the James river bridge at Lynchburg and it will touch Sweet Briar College, Amherst Courthouse, going in a northerly direction to the Nelson county line and probably into the Crabtree Valley. The incorporators of the road are: H. L. Page, president; J. T. Bonny, secretary; H. C. Joyner, J. E. Bowman, C. A. Jubert, Stickley Tucker, W. Ward Hill, C. L. Scott and C. J. Campbell, of Amherst, Va.; Wallace A. Taylor, of Lynchburg, Va., and W. E. Walker, of Sweetbriar, Va.

The Norfolk Southern R. R. Co., has been chartered with a capital stock of $16,000,000 and has taken over all of the lines, equipment and other property of the old Norfolk & Southern Railroad Co. The road was purchased for $8,500,000 under a judgment of sale issued by the United States circuit court.

The Maryland, Delaware & Virginia Ry. Co., W. Thomson, General Manager, Baltimore, Md., is making arrangements to build a new and larger wharf at Tappahannock, Petersburg.

The Norfolk & Western Ry. Co. has awarded the contract to build an underground crossing at Lynchburg Ave., Roanoke, Va., to the Vaughan Construction Co. The work is estimated at $40,000.

Surveyors of the Richmond & Chesapeake Bay R. R. Co., engaged in surveying a route from Fredericksburg, Va., to Washington, have passed Occoquan and are making rapid progress toward Alexandria.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Sound Construction & Engineering Co. of Seattle, has been incorporated with a capital stock of $200,000, the incorporators being C. C. Cawsey, John Hastie, James M. Douglas and H. Lohse, Jr.

Residents of the Stuck and Puyallup Valleys have instructed the State River Commission to expend $25,000 in directing the Stuck River into a permanent course to follow the tracks of the Chicago, Milwaukee & Puget Sound Ry. from a point south of the King county line to about two miles above its present confluence with the Puyallup River. Mayor R. R. White, Sumner, is a member of the Commission.

Good progress is being made with the concreting of the Great Northern Ry. tunnel near Everett. Over 800 ft. of the 2,340 ft. of the bore have already been lined. At the present rate the job will be completed in about nine months.

H. C. Henry, Seattle, has construction work well along on the nine miles of new line of the Chicago, Milwaukee & Puget Sound Ry., between Moncton and North Bend.

The Chicago, Milwaukee & Puget Sound Ry. is said to be securing a new right-of-way from Cosmopolis to Willapa Harbor and thence to Portland. It is said the company is following the North and Little North rivers by easy grade in a southwesterly direction to Willapa Harbor and thence south to Portland.

The Inland Waterway & Canal Co., recently mentioned in these columns, is reported to have secured a large part of the $250,000 necessary for the construction of its proposed canal between Grays Harbor and the Columbia River by way of Willapa Bay. The canal is to be 18 miles long and of the 13 miles between Grays Harbor and Willapa Bay, part will follow a chain of small lakes and the route has been surveyed. More than one-half of the right-of-way has been obtained. The highest point in the entire route is 1.7 ft. above tide level. The canal will be 30 ft. wide and 12 ft. deep in the center. J. H. Marshall, South Bend, Wash., is interested.

Lewis A. McArthur, R. D. Greer and H. D. Hanna have incorporated the Walla Walla Valley Railway Co., and propose to construct and operate a street railway from Walla Walla to Milton, Oregon. The capital stock is $500,000.

The Puget Sound & Alaska Powder Co. is having plans prepared for and in a few days will commence the construction of a deep-water dock at its plant near the southern limits of Everett, to facilitate shipments to Alaska and South Coast points.

The Centralia-Chehalis Interurban Co. has applied to the State Railroad Commission for permission to cross certain highways in Lewis county and the streets of Chehalis and Centralia.

The Oregon & Washington R. R. (Harriman Lines) is said to have completed arrangements for having work started in the construction of a large freight yard at Centralia which will be used for handling business from the Gray's Harbor branch.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chippewa Valley & Northern Ry., J. Z. Arpin, Manager, Atlanta, Wis., is having surveys made for an extension from Buce, Atlanta and Exeland, in a northeasterly direction to Radisson. It is said that the grading work will be started at Exeland.

Announcement has been made by the mayor of Monasha, Wis., that the elevation of the Chicago, Milwaukee & St. Paul tracks to the grade level on Depere St., will be started at once.

The steel railway system at Janesville is to be rebuilt to meet the needs of the projected interurban service.

Board of Directors of the Badger Short Line recently organized to construct a railroad from Prairie Farm to Menominee, Wis., have

met to prepare incorporation papers for fillng the same with State Secretary. Actual construction work will then be taken up.

Advices from Oxford, Wis., state that the Johnson-Carey Construction Co., is making fine progress on the Northwestern line on the east side of the ridge in Oxford. Steam shovels are being used on the work.

The Chicago & Wisconsin Valley Ry. Co. has asked for a franchise at Madison.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A committee appointed by the City Council and Board of Trade of Belleville, has looked over the proposed route of the Canadian Northern Ry. through the city and has reported in favor of the plan of survey submitted by the company.

The Canadian Minister of Railways has approved the projected line of the Alberta Central Ry., of Red Deer, Alberta, from Red Deer east to Sounding Creek, a distance of 150 miles. The actual surveys are now in progress. At the last meeting the company secured the approval of its line west from Red Deer 70 miles and construction work on this section will begin immediately.

The city of Montreal has a plan under consideration to have the Grand Trunk Ry. abolish level crossings between Montreal and St. Henri, a suburb. A new viaduct suggested would be four miles long. Plans are not ready yet and the city commission may be asked to co-operate with the railroad company in its successful carrying out. It is estimated that the plan would cost the Grand Trunk about $8,000,000.

The Canadian Northern Ry. has under contemplation an expenditure of between $3,000,000 and $4,000,000 in Montreal in the near future, in connection with the establishment of suitable passenger terminals in that city.

The Temiskaming & Northern Ontario Ry., S. B. Clement, Chief Engineer, North Bay, Ont., is having over 100 miles of its line resurveyed with a view to rebuilding in order to be prepared for heavy traffic. This is the first section from the Grand Trunk terminus at North Bay to New Liskeard which was built for local traffic before there was any mines at Cobalt and Gowganda and before the Grand Trunk Pacific was contemplated.

Nat Boyd has been awarded the contract for extending the Greenway and Wakopa Branch of the Canadian Northern Ry. to Deloraine.

The Goose Isle branch of the Canadian Northern is to be pushed on 25 miles north, paralleling the C. P. R. line to Teulon. It will be eventually pushed on to Fisher River, affording an outlet for the country lying along the Washow and Fisher rivers, which is now being rapidly settled up. Engineers are now out locating the line.

The Pacific Coast Mining & Development Co. has been formed to develop the mines in the Portland Canal District in British Columbia controlled by D. D. Mann, vice president of the Canadian Northern Ry. The development work will be in charge of H. E. Knobel. Mr. Knobel and H. A. Grant, who will have charge of the proposed 20-mile railway to be built from tidewater at Stewart, B. C., have gone to Stewart preparatory to beginning work.

Advices from Edmonton, Alta., state that Jean Revillon, Paris, France, rival of the Hudson Bay Co., of North Canada, has applied to the Alberta Legislature for a charter to construct a railroad from Edmonton to Grand Prairie, on the Peace River, via Sturgeon Lake, a distance of 250 miles.

The Canadian Public Works Department has awarded the Dominion Dredging Co., Ottawa, a $60,000 contract for dredging in Quebec. Other successful bidders at different points were: L. Cohen & Son, W. J. Poupore and the General Construction Co.

Plans have been filed by the Canadian Pacific Ry. Co. at the city registry office at Ottawa, Ont., involving an outlay of about $1,000,000 for an underground line through the city connecting the Central station near the foot of the Rideau canal with the company's Union station in the northwestern part of the city. The company proposes to acquire from the dominion government the bed of the Rideau canal from the "deep cut" to Sapper's bridge, a distance of about half a mile, and after diverting the water in the canal to the Rideau river to run its railway line along the course of the waterway, paralleling the present railway entrance to a point opposite the new station. From there it is proposed to construct an underground tunnel from near the postoffice under the same to a point on Wellington street near the waterworks aqueduct property and thence on the street level to a connection with the C. P. R.'s present lines at the Union station.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The National Railways of Mexico have commissioned J. S. Hall to prepare plans for a large general office building and terminal station to be erected in the City of Mexico. It is proposed to make this terminal station the largest and finest south of St. Louis. At present the several railroads entering Mexico City belonging to the National Railways of Mexico have their own stations and terminals. These include the old National, the Mexican Central, the Interoceanic and the Hidalgo and Northeastern. It is claimed that by concentrating these several terminals into one great station and directing the affairs of the several lines composing the system from one set of general offices a great saving in cost of operation and maintenance can be had. The location for the proposed central station and terminals is said to have been selected, but pending a final deal for the property public announcement of its situation is withheld. The architect also prepared the preliminary plans for the terminal buildings that are being erected at Vera Cruz by the Vera Cruz Terminal Co. at a cost of about $6,000,000.

Work is to be started shortly on the construction of the gas plant and distributing system at Guadalajara for the Guadalajara Gas Co., a holding corporation of the Gas Operation & Construction Co., of Los Angeles, Cal. George H. Eckert, of San Francisco, and W. A. Aldrich, of Grand Rapids, Mich., gas engineers, are now in Guadalajara to take charge of the work of installing this system.

The Mexico Northwestern Ry. Co. has made a survey of a line for a branch road from San Antonio station to Cusihuiriachic. B. H. Bryant, Casas Grandes, Chihuahua, Mexico, is Chief Engineer.

The Arizona, Mexico & Gulf of California R. R., has been incorporated and proposes the construction of a railroad to Port Lobos, on the Gulf of California from a connection with the Southern Pacific in Arizona by way of the Snora Alter District. The line will be about 200 miles in length. Benjamin P. Cheney, Boston, Mass., is interested in the project which is capitalized at $13,500,000.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is reported to be planning to build a line from Ryder, N. Dak., to Elbowwoods on Fort Berthold reservation, 40 miles distant. Application has been made to the government for permission to enter the reservation.

The Wheeling Rapid Transit Co. is reported to have awarded a contract to MacArthur Bros. Co., New York and Chicago, for the construction of its projected electric railway to Wheeling, W. Va., construction work on which must be started by May 15 under the terms of the franchise.

An ordinance is before the City Council of Hastings, Neb., to grant a franchise to the Omaha, Western & Lincoln Interurban Co. for the use of certain streets for street railway purposes. The Omaha, Western & Lincoln is a reorganization of the Omaha & Nebraska Central, which went through a receivership several months ago. The latter road had secured right of way for almost the entire distance and some grading had been done when the company dissolved. Frank E. Scharff, Lincoln, Neb., is interested.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Greenfield, Ind.—Until 10 a. m., June 20, by County Commissioners, for the construction of a steel bridge over Blue River. C. H. Troy is Auditor of Hancock County.

Jeffersonville, Ind.—Until 11 a. m., June 6, by County Commissioners, for the construction of a bridge over Logan Creek. Peter Nachand is Auditor of Clark County.

Cleveland, O.—Until 11 a. m., May 21, by County Commissioners for constructing, according to report No. 2603, new bridge abutments on the River road in Mayfield township.

Cleveland, O.—Until 11 a. m., May 25, by Board of County Commissioners, for the construction of bridge, per Report No. 2615, extension on Columbia Road, Olmsted Township.

Cleveland, O.—Until 11 a. m., May 21, by County Commissioners, for constructing, per report No. 2611, a concrete bridge over the river on the River road in Brecksville township.

Cleveland, O.—Until 11 a. m., May 21, by Board of County Commissioners, for the construction, according to report No. 2602, of a concrete bridge on the River road in Brecksville township.

Cleveland, O.—Until 11 a. m., May 21, by Board of County Commissioners, for the construction of a bridge, per report No. 2601, on River road in Brecksville township. The structure will be of concrete.

Philadelphia, Pa.—Until noon, May 17, by Director of Public Works, for the construction of bridge on the line of Fox St. over Norristown branch of Philadelphia & Reading Ry. It will be a steel I-beam structure, incased in concrete on concrete abutments and piers, 60 ft. wide, and will have one 30-ft. and two 18-ft. spans. George R. Stearns is director.

Spartansburg, S. C.—Until May 25, by D. M. Miles, County Supervisor, for the construction of a steel bridge over the Enoree River, known as the Van Patton bridge.

Spartansburg, S. C.—Until 10 a. m., May 18, by D. M. Miles, Supervisor, for the construction of a bridge over Lawson's Fork, near Drayton Mills. Bids will be received for both steel and wood structures.

Lyons, Wis.—Until May 18, by Town Clerk, for the construction of a bridge across the Baraboo River at Metcalf's mill, about one mile above this place.

Winnipeg, Man.—Until 11 a. m., June 28, by Chairman, Board of Control, for the construction of concrete piers to be completed on or before the 15th of November, and for the erection of the steel superstructure and floors, with two lines of street railway tracks, to be completed on or before June 1, 1911.

Toronto, Ont.—Until noon, May 17, by G. R. Geary, chairman, Board of Control, for the construction of two reinforced concrete foot bridges, 34 ft. clear span, crossing over Chippewa Ave., Centre Island.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

San Francisco, Cal.—Until 3 p. m., June 15, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the installation of a heating plant, pumps, well, vacuum cleaning plant, electric wiring, alterations to building, etc., for the United States custom house and appraisers' stores building at San Francisco, Cal.

Washington, D. C.—Until 2 p. m., May 20, by Treasury Department, U. S. Life Saving Service, Washington, D. C., for the construction of improvements to the life saving station at Manistee, Mich.

Washington, D. C.—Until 2 p. m., May 17, by S. I. Kimball, General Superintendent, Treasury Department, U. S. Life Saving Department, Washington, D. C., for constructing two life saving stations, one at Chicamacomico, N. C., and the other at Kitty Hawk, N. C.

Key West, Fla.—Until noon, June 15, by J. R. Curry, Jr., Chairman, Board of County Commissioners, for the erection of an addition and repairs to the county jail building.

Fort Des Moines, Ia.—Until 3 p. m., June 3, by Constructing Quartermaster, for the installation of a steam heating plant in the hospital at Fort Des Moines, Ia.

Chicago, Ill.—Until 1:30 p. m., May 16, by Board of County Commissioners, for making certain changes in the boiler room at the Cook County Hospital, covering the labor and material necessary for the installation of a water heater, boiler feed, pumps, piping, etc. William McLaren is Superintendent of Public Service.

Brownstown, Ind.—Until 8 a. m., June 18, by Board of County Commissioners for remodeling, improving, and erecting additions to the county court house, located at this city. H. W. Wacker is Auditor of Jackson County.

Brownstown, Ind.—Until 8 a. m., June 18, by County Commissioners, for remodeling, improving and erecting additions to court house; also separate bids for heating, plumbing, and elec-

trical appliances. H. W. Wacker is Auditor of Jackson County.

Baltimore, Md.—Until 11 a. m., May 18, by Board of Awards, President, J. Barry Mahool, for alterations and improvements in south court of city hall.

Peru, Ind.—Until 2 p. m., June 20, by County Commissioners for the metal furniture and fixtures for new court house. Charles Griswold is Auditor of Miami County.

Peru, Ind.—Until 2 p. m., June 21, by County Commissioners for chairs, desks, tables, etc., for new court house. Charles Griswold is Auditor of Miami County.

La Moure, N. Dak.—Until 2 p. m., June 7, by C. J. Alister, County Auditor, for decorating the new court house for La Moure County.

Asbury Park, N. J.—Until 3 p. m., June 14, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Asbury Park, N. J.

Elizabethtown, N. Y.—Until 4 p. m., May 21, by R. B. Dudley and committee for the reconstruction and repair of the Essex County buildings at Elizabethtown, N. Y.

Middletown, N. Y.—Until 3 p. m., June 9, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Middletown, N. Y.

Cleveland, O.—Until noon, May 26, by H. F. Jordan, Clerk, Board of Education, 605 Euclid Ave., East Cleveland, for furnisihng labor and material for the construction of a two story school building, of brick.

Shamokin, Pa.—Until 3 p. m., June 13, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduit and wiring of the United States Post Office at Shamokin, Pa.

Charleston, S. C.—Until 11 a. m., June 11, by Bureau of Yards and Docks, Navy Department, Washington, D. C., for the construction of a water front substation, building No. 20, U. S. Navy Yard, Charleston, S. C.

Winnipeg, Man.—Until May 11, by Frank Lee, Division Engineer, for the construction of Canadian Pacific freight sheds at Brandon.

Toronto, Ont.—Until 9 a. m., May 25, by Hydro-Electric Power Commission of Ontario, Continental Life Bldg., Toronto, Ont., for the construction of transformer station building superstructure at Port Arthur, Ont.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Wilmington, Del.—Until noon, May 24, by Francis A. Price, County State Highway Commissioner, for building a macadam road in the county of New Castle and the state of Delaware. The work includes the following roads: State Road, commencing at the Kent County line and extending northward 2 miles; road from Mt. Pleasant to the Maryland line, a distance of 3.82 miles; road from Boyd's Corner easterly towards Port Penn, a distance of 1.51 miles; Naman's Creek Road from Casey's bridge to Philadelphia Turnpike, a distance of 3.194 miles.

Centerville, Ia.—Until 2 p. m., May 13, by Hall & Adams, City Engineers, for the construction of 25,930 sq. yds. of brick paving and 20,910 ft. curb and gutter.

Boise City, Idaho.—Until 8 p. m., May 28, by Board of Public Works, Karl Paine, President, for paving with either asphalt, bitulithic, vitrified brick, concrete or granitoid (with oil macadam along street car tracks) in the streets and parts of streets in Paving District No. 15, including approximately 160,000 sq. yds., with necessary excavation and gutters.

Coeur d'Alene, Idaho.—Until 4 p. m., May 16, by H. B. Wright, City Engineer, for the improvement of streets. The city's share of the work will cost $27,000.

Crawfordsville, Ind.—Until 10 a. m., June 7, by County Commissioners, for the construction of improvements on the highway in Madison township. Bennett B. Engle is Auditor of Montgomery County.

Fowler, Ind.—Until 1 p. m., June 6, by County Commissioners, for the construction of a road in Union township. Lemuel Shipman is Auditor of Benton County.

Lebanon, Ind.—Until 1 p. m., June 6, by Board of County Commissioners, for the construction of a gravel road in Eagle township, brick paving through Zionsville. B. F. Herdrich is Auditor of Boone County.

Peru, Ind.—Until noon, June 8, by County Commissioners for the construction of five gravel roads in Jefferson, Erie, Washington and Pipe Creek townships. Charles Griswold is Auditor of Miami County.

Vernon, Ind.—Until 11 a. m., June 6, by County Commissioners, for the construction of 1 1-5 miles of pike road in Geneva township. T. L. Thomas is Auditor of Jennings County.

Vernon, Ind.—Until 11 a. m., June 6, by County Commissioners, for the construction of 2 1-6 miles of pike road in Campbell township. T. L. Thomas is Auditor of Jennings County.

Tipton, Ind.—Until 10 a. m., June 6, by County Commissioners, for the construction of six gravel roads in Madison, Jefferson, Prairie, Liberty and Wildcat townships. J. F. Barlow is Auditor of Tipton County.

Wabash, Ind.—Until 1 p. m., June 7, by County Commissioners for the construction of six gravel roads in Wabash County. J. P. Noftzger is Auditor.

Williamsport, Ind.—Until 1 p. m., June 7, by County Commissioners for the construction of a gravel road in Medina Township.

Williamsport, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction of a gravel road in Pine township. Robert L. Winks is Auditor of Warren County.

Williamsport, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction of a gravel road on the Jordan-Steuben Township line. Robert L. Winks is Auditor of Warren County.

Williamsport, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction of a gravel road on the Pine-Liberty township line. Robert L. Winks is Auditor of Warren County.

Williamsport, Ind.—Until 1 p. m., June 6, by County Commissioners, for the construction of a gravel road in Steuben Township. Robert L. Winks is Auditor of Warren County.

Ironwood, Mich.—Until 5 p. m., May 24, by Jacob Nelson, City Clerk, for necessary grading and for furnishing all necessary labor and materials for the paving of portion of McLeod Ave., Aurora St., Norfolk St. and Ayer St. with tar macadam.

Jackson, Mich.—Until 3 p. m., June 7, by B. H. Klyce, City Engineer, for the construction of approximately 39,000 sq. yds. of pavement and 10,000 lin. ft. of curb. Official advertisement will be found elsewhere in this issue.

Augusta, Me.—Until 2 p. m., May 24, by Paul D. Sargent, State Commissioner of Highways, for the construction of a trunk line from Rockland to Rockport, Me., a distance of 5 4-10 miles.

Baltimore, Md.—Until 11 a. m., May 18, by Board of Awards, for grading, curbing, guttering and paving Grove St. from Edmondson Ave to Westwood Ave. Eugene F. Rodgers is Secretary, Board of Commissioners for Opening Streets.

Baltimore, Md.—Until noon, May 19, by State Roads Commission, Union Trust Bldg., Baltimore, Md., for the construction of sections of state highway aggregating 50½ miles in the following counties: Talbot—On the road between Skipton and Wye Mills, a distance of about 3.49 miles, in one section; stone macadam. Queen Anne's — On the road between Starkey's Corner and Church Hill, in one section of 1.97 miles, and one section on the road from Church Hill toward Chestertown, a distance of about 3.50 miles; stone macadam. Kent—On the road from Kennedyville to Locust Grove, in one section, a distance of about 3.23 miles; stone macadam. Baltimore—On the Belair road, from the city limits to Overlea, in one section, a distance of about 3.41 miles, and one section from Overlea to Necker, a distance of about 2.59 miles, and one section from Necker to Perry Hall, a distance of about 2.54 miles, stone macadam. Prince George's—On the Marlboro pike, from the District of Columbia line, in one section, a distance of 5.20 miles, to Meadows, including the repairs to the existing stone macadam road of about 6,900 ft. Charles —On the road between White Plains and the Prince George's County line, near Mattawoman, in one section, a distance of about 6.25 miles; gravel. Washington—On the National pike, from 2 miles west of Conococheague bridge toward Indian Spring, a distance of about 4.29 miles, in one section; stone macadam. Allegany—On the National pike between Standard Oil warehouse and the Pennsylvania railroad crossing, in one section, a distance of about 0.53 mile, and on the National pike between Six-Mile House and Allegany Grove, in one section, a distance of about 1.02 miles; stone macadam. Garrett—On the National pike, in Garrett County, from the Allegany County line toward Piney Grove, in one section, a distance of about 2.38 miles; stone macadam. St. Mary's—On the Mechanicsville-Leonardtown road, from Hellen toward Leonardtown, in one section, a distance of about 5.20 miles; bids will be received both for grading, bridging, and draining only, and for macadam construction. Carroll—On the road between Eldersburg and Gamber, in one section, a distance of about 5 miles; stone macadam. Harford—From the end of the stone road at Kalmia to McCann's Corner, a distance of 2.22 miles, in one section; stone macadam.

Baltimore, Md.—Until 11 a. m., May 11, by Board of Awards, for 645 yds. of vitrified brick pavement at Gay St. yard of the Water Board. Alfred M. Quick is Water Engineer.

Agricultural College, Miss.—Until 2 p. m., May 17, by D. W. Brown, Professor Civil Engineering, Agricultural College, for constructing a modern macadam road from Starkville to this place. According to plans the road will be 1½ miles, covered with broken stone, 24 ft. wide and 6 ins. deep.

St. Louis, Mo.—Until May 13 by Board of Public Works, for the pavement of 16 streets with asphalt, brick, granite, bitulithic, telford and wood blocks.

Webb City, Mo.—Until 5 p. m., May 16, by A. J. McKinzie, City Engineer, for the construction of about 16,000 sq. yds. of asphalted macadam pavement.

Billings, Mont.—Until 8 p. m., June 21, by J. D. Matheson, City Clerk, for creating Special Improvement District No. 53. The work includes aproximately 59,856 sq. yds. of creosoted block pavement. Official advertisement will be found elsewhere in this issue.

Laurinsburg, N. C.—Until noon, May 23, by Town Clerk, for the construction of about 2,500 sq. yds. of concrete sidewalk paving, with curb and gutters, according to plans and specifications. M. J. John is Mayor.

Concord, N. H.—Until 1 p. m., May 20, by H. C. Hill, State Highway Engineer, for the construction of 6,400 ft. of trap rock road in Keene, N. H.

Raymond, N. H.—Until 1 p. m., May 20, by H. C. Hill, State Highway Engineer, Concord, N. H., for the construction of a 2,000-ft. native stone road in this place.

Tilton, N. H.—Until 1 p. m., May 20, by H. C. Hill, Concord, N. H., State Highway Engineer, for the construction of a native stone road 8,000 ft. in length in this town.

Newton, N. J.—Until noon, May 12, by Loren T. Cole, Director of Board Chosen Freeholders, for grading and macadamizing public road located in Sandyston Township, Sussex County—Sec. 1, from Tuttle's Corner to Pine Hill and village of Layton, 2.36 miles; Sec. 2, from first section, Pine Hill, toward village of Bevans, .91 of a mile, to the Flatbrook bridge.

Montvale, N. J.—Until 8:30 p. m., May 28, by Mayor and Council for the grading and macadamizing of Grand Ave., Middletown Road and Blue Road, a total distance of 1.301 miles. Fred C. Linderman is Mayor and John B. Hering is Borough Clerk.

Montvale, N. J.—Until 9 p. m., May 28, by Mayor and Council for the grading and macadamizing of a portion of Magnolia Ave., a distance of about 1 mile. John B. Hering is Borough Clerk.

Montvale, N. J.—Until 9:30 p. m., May 28, by Mayor and City Council for the grading and macadamizing of Summit Ave., a distance of 4,100 ft. Fred C. Linderman is Mayor.

Somerville, N. J.—Until 10:30, May 26, by Board of Chosen Freeholders of the county for grading and macadamizing 7 roads in county aggregating 15 miles in length. Thomas E. Gibson is director of the board, Somerville, N. J.

Albany, N. Y.—Until 1 p. m., May 27, by S. Percy Hooker, chairman, State Highway Commission, for the improvement of the following highways:

County.	Road Number.	Approximate Miles.
Albany	849	1.10
Cattaraugus	5,066	2.94
Chautauqua	5,067	1.06
Chenango	5,057	.51
Clinton	5,056	2.28
Clinton and Essex	859	1.24
Cortland	5,058	2.01
Cortland	738	6.51
Delaware	145-R	1.00
Erie	5,061	1.08
Erie	525-A	.59
Erie	862	.97
Erie	863	1.06
Erie	866	2.01
Erie	751	7.07
Fulton	5,065	2.43
Herkimer	5,060	.77
Herkimer	5,064	1.57
Montgomery	864	.90
Niagara	5,063	2.50
Oneida	5,059	1.60
Orange	414	5.54
Orleans	393	3.61
Saratoga	5,062	2.74
Saratoga	611	6.64
Warren	843	.17
Warren	5,068	1.48
Wayne	860	3.48
Wayne	861	1.58
Westchester	865	3.01

Dunkirk, N. Y.—Until May 14 (postponement of date from May 3) by Common Council for paving Swan and Fox Sts

Cincinnati, O.—Until noon, May 20, by Board of County Commissioners for the improvement of the Biddinger Pike from Harrison to Butler County line in Harrison Township. Stanley Struble is president of the board.

Cleveland O.—Until 11 a. m., May 25, by Board of County Commissioners for the improvement of Independence Road No. 2 from Harvard Road to the property line between Henry Krapf and Peter Schmidt, a distance of 8,910 ft. The work includes grading and draining.

Delaware, O.—Until noon, May 21, by W. F. Whittier, County Surveyor, for the construction of Wheeler Road, in Brown and Oxford townships, and extending from Leonardsburg north to the Shoemaker Road, about 1½ miles long. The work includes grading, macadamizing and draining.

Delaware, O.—Until noon, May 21, by W. F. Whittier, County Surveyor, for the construction of Sherwood Road in Oxford and Troy townships from the Steam town road to Horse Shoe Road, a distance of about 1½ miles.

Galveston, Tex.—Until May 16, by County Auditor, John M. Murch, for the ditching, grading, culvert and surfacing and paving with rock

Grout Wash a Protection Against Frost.

The interesting statement is made in an article by Mr. W. D'Rohan in another column of this issue that: "A thick coat of grout wash is sufficient protection for concrete or plaster against a fairly heavy frost." Mr. D'Rohan bases his conclusion on experience with ditch lining of cement mortar laid at temperatures varying from 0° to 40° F. A coat of 1:3 grout ⅛ in. thick brushed over the surface of the plaster prevented injury from frost, although the grout coat itself was frozen and destroyed. The experience is new to us and we should be glad to hear from any of our readers who have data which bear out or tend to disprove Mr. D'Rohan's conclusion.

The Position of the Los Angeles Aqueduct Work in the Argument for the Superiority of Day Labor Construction of Engineering Works.

There have been few engineering works done by day labor under as competent and unhampered engineering direction as the Los Angeles Aqueduct. We make this statement advisedly. The men directing this work as chief and assistant chief engineers are acknowledgedly administrators of exceptional ability—this makes their reputation even more than does their technical ability and that ranks high. Both are confessedly economists in construction work. They have not been hampered by politics in their work, and more than this they are intolerant of political interference and by rank and attainment are independent of any necessity of deferring to, and, in large measure, free from demands to defer to, considerations of political subserviency or expediency.

We make these statements frankly and honestly for two reasons: First the record of these men on the Los Angeles Aqueduct work has been exploited by a contemporary well known for its predelection toward paternalism in public affairs as a fair proof of the economic merit of the principle of doing construction work generally by day labor; second in these statements lies not the proof of the merit of this principle but a most crushing proof of its general economic deficiency.

In another column of this issue we reprint a published defense by the assistant chief engineer of the aqueduct of the day labor plan of doing the bulk of the construction work and, incidentally, an argument in general support of the day labor system. In reading this article the query naturally arises as to how far its preparation was influenced by a demand to counteract popular inquiry aroused by a previously published article evidencing the expensiveness of day labor construction and as to how far it was a call to make public a great economic truth. However, the publication was justifiable for either reason. So much of this article as unqualifiedly evidenced the superior economy of day labor work was published in *Engineering News* of April 28, 1910, and used by that journal as a peg upon which to hang an iteration of its belief in the economic soundness of day labor work as "amply shown by the Panama Canal construction work."

Returning to the consideration of Mr. Lippincott's article in its entirety as published by us, there are a number of points that warrant comment. It is perhaps a little wide of the facts to assert that the report of Metcalf & Eddy was "extensively reviewed by engineering publications." Except for isolated fragments published here and there those parts of the report of Metcalf & Eddy, which bore on the relative cost of day labor and contract work, were extensively reviewed in only one engineering publication. ENGINEERING-CONTRACTING did extensively review the report, believing it to be a very important document on construction economics. Noting that Mr. Lippincott credits Metcalf & Eddy as engineers in "good standing" we pass the inference of the following clause and point out that their conclusions were confirmed by the independent studies of Mr. Samuel Whinery and of the commission which investigated the refuse disposal problem. Our issues of Dec. 22 and 29, 1909, and of April 6, 1910, furnish the details.

These several investigations, it will be noted, do not leave Metcalf & Eddy unsupported in their finding that force account work is the more expensive "in certain New England cities." New England cities do not stand alone, however, in supplying evidence of this kind. An investigation of day labor sewer work in Chicago by the Commission on City Expenditures (Eng.-Contg., Feb. 23, 1910) showed an excess cost of work of some 65 per cent. Reports of doing street work by force account and city plant in New Orleans, in Baltimore, in Brooklyn, and in Indianapolis have been published within a twelvemonth showing excessive costs of day labor work. Even the Panama Canal costs regarded as so noteworthy by the *Engineering News* are open to most successful criticism as being extravagant.

The kernal of Mr. Lippincott's argument for the superior economy of day labor work is in the comparative figures which he presents. We accept, as we must of course, these figures as correct. It will be noted that the comparison of day labor actual costs is made with contractors' bidding prices. The difference is $13.13 per foot for tunnels and $3.85 per foot for conduit. If the contractor could have done the work as cheaply as did the city forces, these amounts would have been his profits. Now a profit of $988,675 on a, say, $3,000,000 job—a profit of 33 per cent—is, to put it mildly, out of the usual run of "good things" that fall to the contractor's lot. No intelligent contractor bidding in open competition and with a fair knowledge of the conditions of the work would dare to figure on such a profit if he hoped to get the contract. To our mind the comparison of actual costs and bidding prices made by Mr. Lippincott indicates but one of two things, either inexperienced bidders or that these bidders were compelled to "go it blind" in making their bids. Mr. Lippincott indicates that the bidders were capable men in their line of business. Naturally, otherwise the comparison would have failed.

Did the bidders on this work know reasonably well the conditions that would be encountered? Did Mr. Lippincott know them? If they did then we beg leave to dispute Mr. Lippincott's opinion that the bidders who submitted prices fairly represented the skill and ability of the contracting business. If they did not know them, where is the fairness of the comparison and what is to be said of a preliminary engineering study which does not admit of estimating within 33 per cent of the cost of a $3,000,000 job? We have the aqueduct engineers' statements that exceeding care has been exercised in making studies leading to construction economies. Were these studies available to the contractors who bid on the work? If they were not, wherein is the fairness of using the contractor's bidding prices in comparison? They were not as the concluding paragraphs of Mr. Lippencott's article clearly shows. The *Engineering News* reads merit into this circumstance and sapiently remarks that "as the progress of excavation shows up the character of the material changes in design often become desirable." Verily, make the contractor bid a price for which he will build such a structure as may be designed when "the character of the material shows up," and then hold up that price as a horrible example when the engineer adopts a design which the contractor did not guess.

The bidding prices given by Mr. Lippincott show nothing more than that contractors were bidding in the dark on this work. They do not show at what cost the contractor could have done the work under the conditions as developed, nor do they show what prices he would have bid had he been able to forecast these conditions with reasonable assurance.

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

The actual figures of cost which have been published are few. A study of them does not show a single instance which cannot be met with contract costs as cheap or cheaper. We shall not take space to present the proofs at this time but anyone can find them by collating the costs of contract work published in this journal.

Turning to another feature of the article by Mr. Lippincott we call attention to his third paragraph. Mr. Lippincott says: "There is no reason why a municipality with large financial resources, capable of buying adequate equipment and paying reasonable salaries should not obtain as high-grade machinery and superintendents as any contractor." Theoretically there is not, but practically it is done so rarely that the exception proves the rule. This is a patent fact and Mr. Lippincott has indicated why in the opening sentences of the paragraph from which we quote.

It is not "superfluous" to discuss the question. The influence of politics, the accumulation of inefficients, the stagnation coming from irresponsibility of action and the want of the spur of oversight sharpened by danger to financial life are the conditions under which day labor work must ordinarily be done, and if discussion is "superfluous" at all it is superfluous as relating to such ideal conditions as Mr. Lippincott names for the Los Angeles aqueduct work.

But let us suppose that there is no reason why a municipality should not "obtain as high a grade of machinery and superintendents as any contractor," there remains the fact that the city cannot purchase the vital influence toward efficiency that arises from the knowledge that compensation depends directly on the money saved by increasing efficiency, that financial ruin may be the price of any lack of foresight and of alertness in watching expenditures and output. These are the vital influences of contract work. Pride in one's work, honesty and honorableness, desire for reputation and rank are not such vital influences toward efficiency with the rank and file of men who do and direct our engineering works. Few professional men take a less sordid view of their work than do engineers, but the "bubble reputation" is none the less iridescent when viewed with the eye of solvency.

The records of day labor work almost invariably show it to be more costly than contract construction. In the rare instances where it has not been more costly or in the still more rare instances where it has been less costly it has been due to the employing of contract business methods and management and the elimination of every factor and influence that ordinarily characterize day labor construction. Such success as day labor work on the Los Angeles aqueduct will show is due to this fact alone.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Some Notes on Methods of Constructing Concrete Lined Shafts.

Concrete has been used successfully for lining both circular and rectangular shafts mostly for mine workings. It provides a fireproof, reasonably water-tight and very permanent lining and is a quick and economic construction. Methods of construction vary, depending on the method of sinking which is influenced by the nature of the material penetrated and the amount and depth of water encountered. The following are methods that have been employed successfully.

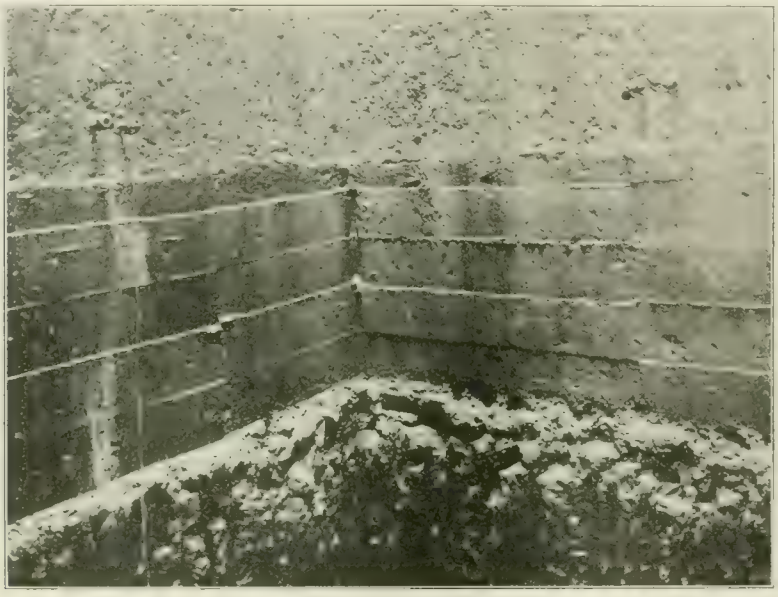

Fig. 1.—View Inside Smith Shaft Showing Seal Between Concrete Lining and Ledge Rock.

Smith Shaft, Cleveland-Cliffs Iron Co.—Diamond drill borings showed 60 ft. of water bearing quicksand, gravel and boulders overlying ledge rock. The requirements were a water-tight plumb shaft and a water-tight joint at ledge level. The decision was to sink to ledge rock by the pneumatic process a reinforced concrete caisson, the walls of which would constitute the shaft lining. The outside dimensions of the caisson were 21⅓x 17⅓ ft., and its walls were made 3 ft. thick at the bottom and 1½ ft. thick at the top. The concrete was started on a shoe of two layers of 12x12-in. timbers beveled on the inside and shod with heavy angle iron. The shoe timbers were heavily bolted vertically and horizontally and the shoe was anchored to the concrete by 1 to 1¼-in. square rods passing from the bottom up through the shoe and the concrete walls and spaced about 18 ins. apart. These anchor rods formed the vertical reinforcement of the walls, the horizontal reinforcement consisted of similar rods spaced 6 to 8 ins. apart vertically. The horizontal reinforcement was designed to take the earth and water pressure and the vertical reinforcement to anchor the sections of wall from pulling apart during sinking. At a point 6 ft. above the cutting edge the concrete walls were notched inside to receive a working chamber roof of 12x12-in. timbers. Steel working shafts and air locks were provided.

The method of sinking was as follows: The timber shoe was first assembled in position on the surface and the inside forms built on top to a height of 10 ft. All other forms were built apart from the shaft in interchangeable sections 6 ft. high; the material was 2x8-in. tongue and grooved plank. The walls were built to a height of 18 ft. before sinking was begun; sinking was done without air to a depth of 5 ft., then water was encountered and compressed air was used. The method of sinking proper was the usual pneumatic caisson method. As fast as the caisson sunk the walls were built upward; it was endeavored to keep the walls always 18 ft. above the surface to permit the use of three sections of forms, the lower section being removed as it reached the ground and placed on top. The caisson went down the first 40 ft. by its own weight, it was then loaded as necessary by piling sand on the working chamber roof. The caisson was sunk to rock in one month; the rock was found to have a slope of 3½ ft. in 20 ft.; to level this off and go down 2 ft. further to escape a seam required another month.

When level rock was reached the top inside timber of the shoe was cut away and the wall concrete carried down to the rock. This concrete was allowed to set under air pressure for 3 days, then pressure was gradually removed. There was no leakage at the joint; the total leakage of the walls was 650 gals. per 24 hrs. Figure 1 is an inside view of the shaft showing the joint concrete. The shaft was built by the Foundation Co., Chicago, Ill.

Kidder Shaft Cleveland Cliffs Iron Co.—This shaft penetrated waterbearing quicksand, gravel and clay overlying a broken and seamy ledge rock at a depth of 104 ft. It was decided to sink a circular shaft and to this end plans were drawn for a cylindrical reinforced concrete caisson 24 ft. in diameter mounted on a steel shoe of the same diameter.

The shoe construction deserves notice and is indicated by the sketch Fig. 2. On the outside of the bottom there is a ⅝-in. steel plate 30 ins. high. To this were fastened 12 brackets carrying a conical inside sheeting. This conical inside sheeting extended up about 10 ft. until the diameter contracted to 10 ft. and on this opening was built a 10-ft. cylindrical steel shaft. This shaft was built up as the sinking progressed as was the outside wall of reinforced concrete which formed the shaft lining. Inside and outside forms were used for the concrete wall. The outside forms consisted of three rings 24 ft. in diameter and each 5 ft. high. Each ring consisted of six sections, each made up of ½-in. steel plate with angles in all four edges all curved to the proper arc. Bolt holes in the angles permitted the six sections to be connected up to form a complete ring and, also, the rings to be connected to each other. The inside forms were

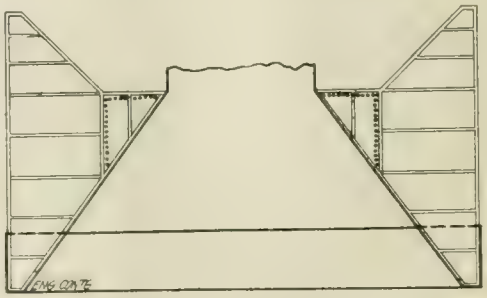

Fig. 2.—Sketch Showing Steel Shoe for Kidder Shaft Caisson.

also made in three rings, but the sections were built of 2x6-in. tongued and grooved pine lagging fastened to three curved 4x4½-in. steel angles and the diameters of the rings varied with the thickness of the walls at different heights. These wall thicknesses were as follows:

Depth, feet.	Thickness. Ft	Ins
0 to 17	4	0
17 to 50	3	6
50 to 82	3	0
82 to 113	3	6

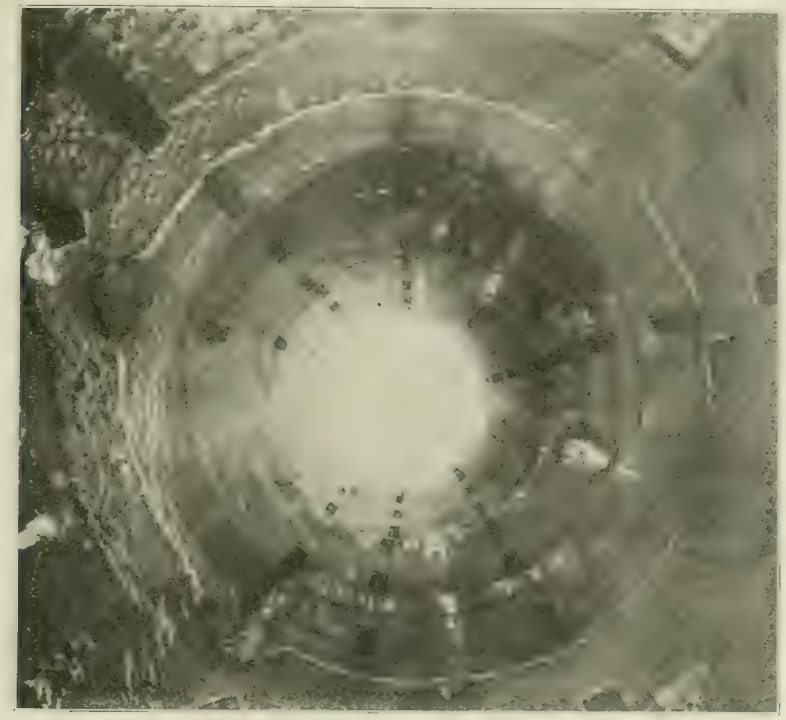

Fig. 3.—View Looking Up Through Concrete Lined Circular Kidder Shaft.

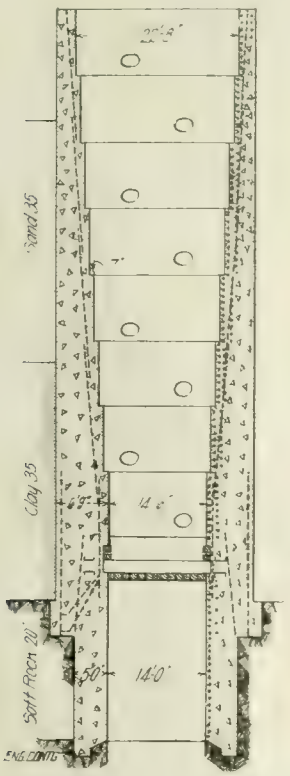

Fig. 4.—Transverse Section of Woodward Colliery Shaft.

The wall was reinforced with horizontal rings and vertical bars.

The method of sinking was as follows: The shoe was set up with two sections of steel shaft riveted to the top of the arm and the outside wall built up to a height of 15 ft. A clam-shell bucket was then operated inside the steel shaft and the caisson sunk by its own weight, the walls being kept built up well above ground. Dredging continued to a depth of 87 ft. where a stratum 2 ft. thick of hard clay was encountered. After dredging for several hours this clay stratum was pierced in one place and through this opening the underlying quicksand rushed in, causing a slump which extended to the surface and threw the caisson some 6 ins. out of plumb. A steel roof was then bolted to the top of the shaft, an air lock was placed and sinking continued by the pneumatic process until solid rock was met at a total depth of 113 ft., or 103 ft. below water level. An air pressure of 45 lbs. was required at the greatest depth and two 40-min. shifts were a day's work. The joint between concrete and rock was made by filling in the wedge with concrete. Figure 3 is a view looking up through the Kidder shaft. The total time of sinking this shaft was from Aug. 15, 1908, to Jan. 15, 1909, or five months, or at the rate of 22.6 ft. per month, including lining. The shaft was built by the Foundation Co., Chicago, Ill.

Woodward Colliery Shaft, Wilkesbarre, Pa.—This shaft penetrated quicksand, gravel and clay overlying sand-slate rock at a depth of 79 ft. Water level was normally 15 ft. below the surface, but highwater in the nearby Susquehanna River raised it to surface level. The plan adopted was to sink a reinforced concrete caisson with a steel cutting edge. Figure 4 is a transverse section of the caisson, which was 59½ ft. long outside. Two transverse partitions of reinforced concrete divided the shaft into three compartments. The caisson had its corners rounded to a radius outside of 6⅓ ft. The shoe consisted of a circumferential plate 32 ins. high and ¾ in. thick set vertically. At a height of 8 ins. above the bottom edge of this plate an inside horizontal shelf plate was connected by angles and brackets to the vertical plate. The method of construction was as follows:

A pit was excavated to a depth of 15 ft. with scrapers and on its level bottom was erected the steel shoe. Using three rings of outside forms and three corresponding rings of inside forms the concrete walls were then built to well above the timber deck level as shown by Fig. 4. Sinking was then begun by excavating in the open inside the caissons the water amounted to a maximum of 1,200 gals. per minute until clay was entered, after which no water was encountered until rock was reached when highwater in the river gave enough additional head to cause a flow under the edge of the caisson which required a large pumping plant to handle.

The sinking was done in two 10-hour shifts per 24 hours, working a foreman and 16 men in each shift. The spoil was loaded into buckets and hoisted by derricks on top. An excavation of 90 to 100 cu. yds. per shift was considered good progress. No serious trouble was had, but care had to be exercised, in keeping the caisson plumb. No use was made of the wood deck, which had been planned for in case sinking by compressed air had to be resorted to.

When rock was reached and after lowering

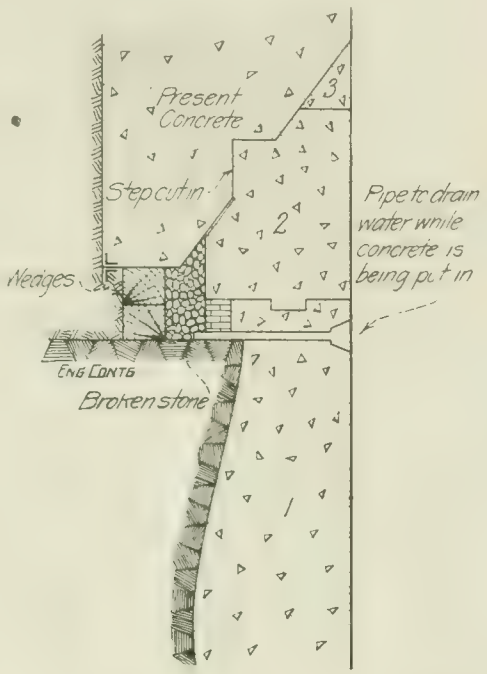

Fig. 5.—Details of Seal, Woodward Colliery Shaft.

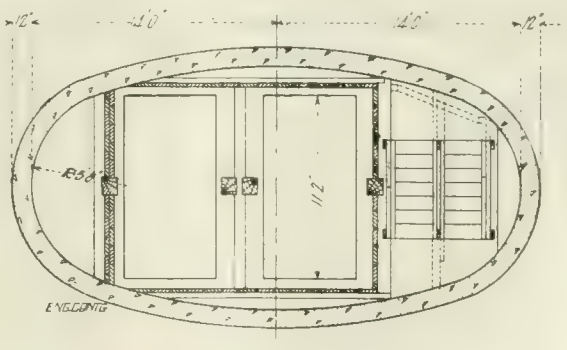

Fig. 6.—Section of Mine Hoisting Shaft, Filbert Mine.

the flood water previously mentioned, the first task was to seal under the cutting edge. This was accomplished by means of blocks and wedges as shown by the detail Fig. 5. The next step was to take out the rock for a depth of some 20 ft. below the cutting edge of the caisson and build the underpinning wall

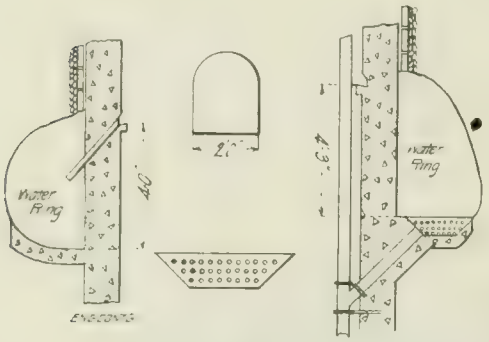

Fig. 7.—Details of Water Ring in Ventilating Shaft, Filbert Mine.

shown by Fig. 4. A channel cut 5 ft. deep all around the edge was first made. This permitted the core to be blasted out without danger of jarring the wood packing loose or breaking back underneath it. Ordinary blasting methods were then employed, taking out the rock in 5-ft. benches, until the level of the bottom of the underpinning wall was reached, when a second channel cut 5 ft. deep was made and the core removed. This permitted the underpinning wall to be started on a dry bench which was not likely to be broken down by subsequent shaft sinking.

In starting the underpinning wall the rock bench or shelf was recessed as shown by Fig. 4 and carefully cleaned. The wall was then carried up and the seal between it and the caisson concrete was made as follows: The brick dam and vent pipes were constructed as shown and the wall carried up to the level shown. Next the ring of concrete marked 2 in Fig. 5 was put in. After this concrete had set grout was pumped into the pipes shown until everything was tight. Then the joint between the concrete ring 2 and the caisson concrete was caulked and the closing ring 3 of concrete was put in. The work as described was done by the Foundation Co. of New York City, as contractors.

Filbert Mine Shafts, H. C. Frick Coke Co.—Two shafts of the general form shown by Fig. 6 were sunk through rock. The main shaft had the cross-section shown by Fig. 6 and was 550 ft. deep with a 15-ft. sump. The ventilating shaft is 14x34 ft. inside the lining and is 581 ft. deep with a 9-ft. sump. The tops of both shafts have copings of massive concrete which form foundations for head frames. This copings extend down to rock some 19 ft. The general method of construction was to sink the shaft a certain depth and then construct the lining upward, then sink another lift and line it upward, repeating the operation till the shaft was completed.

The sinking was done using 60 per cent gelatine and firing maximum shots of from 150 to 200 lbs. The cut or sump holes were 12 ft. deep and those of the side rounds were 10 ft. deep. The muck was hoisted by derricks, the good stone for crushing picked out and the remainder taken in dump cars to spoil banks. An average of 5 men on top and 12 men on the bottom working 8-hour shifts was employed.

In concreting the successive heights hitches were cut in the rock walls about 10 ft. above the bottom and in them were placed dead logs to support the forms. The first ring of forms was set up, the buntons placed, a platform built at the level of the top of the form and the concrete placed. A second ring of forms was then erected on the first, the working platform was raised and concreting resumed. This process was repeated until the lining was completed. Three rings of forms were used, the lowermost being removed and placed on top as the work advanced. A 1:2.5:1½ in. stone concrete was used. Concreting was started in the main shaft when it had reached a depth of 65 ft. and in the ventilating shaft when it had reached a depth of 115 ft. Afterward the lining was placed in 50-ft. sections. The average time for completing a 50-ft. section was six 24-hour days, working 9 men at the top and 4 men at the bottom. When concrete was placed in cold weather warm mixing water was used and the sand and stone were heated with steam jets.

To make the joint between the top of one section and the bottom of the completed section above the following procedure was employed. In beginning each section the floor at the bottom of the form ring was not set horizontal but was laid with a down pitch of 45° toward the rock side of the shaft. The top of the section below was brought up to within 6 ins. of the sloping bottom of the section above and this 6-in. ring was concreted with a special mixture of cement, screenings and crusher dust in the proportions of 1½:2. Grout wash was used to perfect the bond between the old and new concrete. The thickness of concrete lining varied from 12 to 33 ins.

The forms were of steel and were made by the Blaw Collapsible Steel Centering Co., Pittsburg, Pa. They were made in rings 5 ft. high and each ring was divided into convenient sections for handling. To allow for the placing of buntons notches were cut in the top edge of each ring. A force of 4 men on top and 6 men on the bottom was required to handle the forms. Forms were left in place a minimum of 72 hours.

A feature of the work was the provisions for handling water during and after construction. To handle the water after construction a water ring was constructed in each shaft. Figure 7 shows the details of the water ring for the ventilating shaft. A circumferential nich was cut in the rock wall as shown and lined with concrete to have a trough-shaped bottom having a fall right and left around the wall to a low point, where a drainage pipe was inserted through the lining. To bring the water coming from the rock to the water ring vertical tile pipes were placed behind the lining. To collect the water flowing down the face of the lining a circular groove was molded in the face just above the water ring, as shown by Fig. 7; a pipe through the lining into the water ring caught the water from the low point of the groove.

The following is a summary of the quantities and progress: From both shafts 50,000 cu. yds. of materials measured loose were taken; the increase over the calculated yardage in the solid was 135 per cent. The materials required for the 650 cu. yds. of concrete were: 8,217 bbls. of cement, 4,410 tons of crushed stone and 2,528 tons of sand. It is interesting to compare the calculated and actual yardages of concrete required per vertical foot of shaft. They were as follows:

Thickness of wall, ins.	Calculated amount Cu. yds.	Actual amount Cu. yds.	Percentage. Increase.
	Main Shaft.		
12	2.66	4.6	73
15	3.36	5.0	49
18	4.08	6.4	57
24	5.56	9.0	62
	Ventilating Shaft.		
12	3.10	5.40	74
15	3.92	5.62	43
18	4.74	5.84	23
24	6.45	9.50	47

The progress of work, including excavation and lining complete, was as follows: The main shaft requiring 565 ft. of excavation and 539 ft. of lining was completed in 46 weeks, making an average progress of 48 ft. per month. The ventilating shaft requiring 591.2 ft. of excavation and 561 ft. of lining was completed in 62 weeks, making an average progress of 37.2 ft. per month. The following summary gives the principle figures regarding the work on both shafts:

Item.	Main shaft.	Ventilating shaft.
Total depth, ft.	565	591.2
Total weeks worked.	46	62
Av. depth sunk per week.	..	9.5
Av. depth lining placed per week.	12.3	9.1
Av. depth completed per month..	48	37.2
Inside dimensions, ft.	..	14x34
Area, sq. ft.	..	390
Av. thickness lining, ins.	16	17
Av. concrete per 5-ft. ring, cu yds.	28	33

Conclusion.—We are indebted for the information from which the above description has been prepared to the Foundation Co., Chicago and New York, for the Smith, Kidder and Woodward shafts, and to an article by A. F. Allard and H. S. Patterson in *Mines and Minerals*, April, 1910, for the Filbert mine shaft. An article describing the method and cost of constructing a concrete lined shaft was published in ENGINEERING-CONTRACTING for March 2, 1910.

Method of Constructing Concrete Slope Paving Under Water Lachine Canal, Canada.*

The work described comprises 5 miles of concrete slope wall constructed under water by means of a special plant designed for this purpose. It was part of the Lachine Canal improvement in Canada. Originally this canal had been slope paved with stone taken from the excavation as shown at A Fig. 1. Owing to disintegration of some of the stone and increased wave action due to steam propulsion, large sections of this wall were destroyed. In 1908 work was begun replacing this old wall with a wall of heavier courses of limestone, starting with a bottom thickness of 3 ft. and decreasing in thickness 1 in. per 1 ft. of slope. The construction is shown at B Fig. 1. As this wall had to be built in the dry and as only about 3 weeks in April each year were available for dry work, the progress was slow. To hasten reconstruction a plan was devised in 1904 to use concrete as shown at C Fig. 1 and by Fig. 2. This plan was to use a belt of concrete 8 to 12 ft. wide and about 1 ft. thick, placed in the middle section of the wall leaving in any rip-rap below which was in good condition and running the concrete

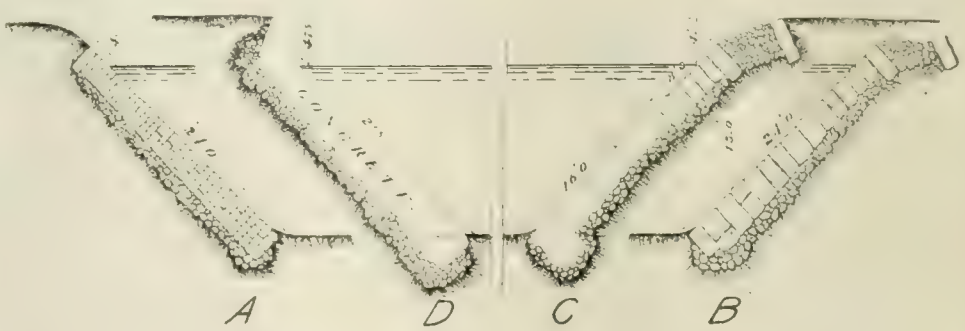

Fig. 1.—Sketches Showing Successive Forms of Slope Paving for Lachine Canal.

all the way down to firm foundations in columns 5 ft. wide at intervals of about 24 ft. c to c as shown by Fig. 2. From the concrete belt upward the limestone rip-rap as originally designed was to be used. This construction gave a good wall and more of it in a limited time, but not enough to meet the demands.

The method of doing the work in the dry

*Rearranged and condensed from a paper by H. R. Lordly presented to the Canadian Society of Civil Engineers, March 17, 1910.

had proved too slow, and some more rapid system had to be devised. It was then proposed that the walls should be laid entirely in concrete, except the revetment, and that the whole work should be done without unwatering the canal and during the period of navigation. Under-water-concrete work had already been done in some minor cases on the canal, but in lining the prism walls below water with concrete a different problem arose.

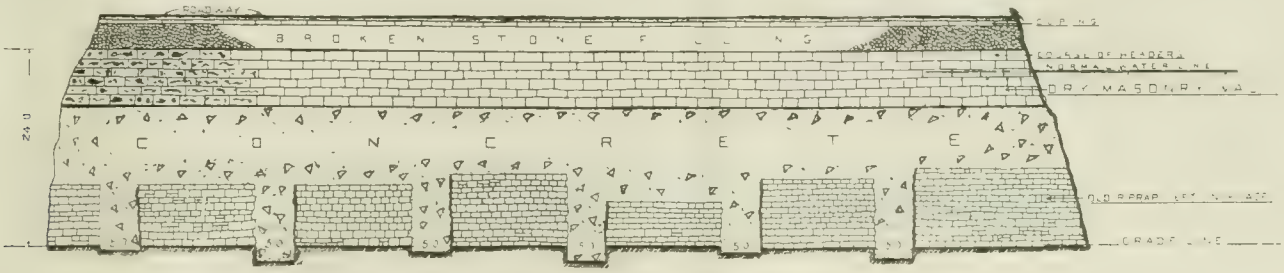

Fig. 2.—Elevation of Slope Wall Having Midheight Band of Concrete Supported by Columns.

Navigation was to be maintained; the current in the canal of about one mile per hour and the wash of passing vessels had to be provided for. The face of the wall is 24 ft., slope 1 to 1. The thickness of concrete required 18 ins., and, as mold boards would have to be used, there was a danger of the concrete clogging between the form and the projections of the old masonry wall, thus creating large voids. A method of preventing the clogging and forcing the concrete down in place had to be devised.

After some preliminary discussion, the contractors for the original work, Messrs. Haney, Miller, Quinlan & Robertson came forward with an offer to do the work under the above conditions, and agreed to build the following plant: Six molds, or forms, 100 ft. by 24 ft. face; a mixing plant, with a ram and box that would carry the concrete down between the wall and the forms; a lifting scow; a diving plant, etc., etc. The plant was calculated to do 200 yds. per day.

It was proposed to prepare the toe of the walls during the spring unwatering. The forms were to be floated to the work, during the period of navigation, placed by the aid of the lifting scow and divers, and heavily loaded at the bottom to remain in position. Each form would be kept in place until the concrete was set sufficiently hard to permit of its removal, and would then be moved to the head of the line in order to continue the work. The designing of the forms and plant was placed in care of Mr. A. T. Gibson, the chief assistant engineer for the contractors. While erecting and removing the forms was also required. In designing the mixing and laying plant, which was to be on scows, some important points had to be considered.

(1) The scows must be narrow and lay parallel (longitudinally) to the banks in order not to obstruct navigation.

(2) The ram carrying the box with movable bottom to deposit the concrete required to be operated on a slope of 45°.

(3) Its tendency to move with the wave undulations had to be overcome.

(4) The ram had also to be so designed that it could be moved past any obstructions on the banks, electric current poles, telegraph poles, etc.

(5) The operating machinery of the ram required to be under perfect control and but little agitation of the water behind the forms created by its action.

In addition to the above, a supply bin, an automatic hoist and measure, to feed the mixer, had to be designed to suit the requirements of the work. A diving outfit and lifting scow, anchors for the molds, etc., were also required. It will be thus seen that the conditions were many and somewhat difficult to overcome.

Molds.—The molds were constructed of heavy timber, each mold being 100x22 ft., additional width being added at the top by placing longitudinal plans on the part out of the water. Figure 3 gives a good idea of the method of construction and the details of the longitudinal trusses to give stiffness to the framework. The heavy timbers were British Columbia fir. A platform or cradle was provided about 5 ft. from the bottom of the mold to hold iron rails for ballast. The entire plan was carefully carried out, and, as will be seen later, the molds were perfectly successful and rigid enough to be kept in nearly perfect alignment.

Mixing and Depositing Plant.—Figure 4 gives the general arrangement and details of the mixing plant. The plant is shown in place and ready for operation. It will be noticed that the scow is a narrow one, and that the overhang platform carrying the mixer and receiver hopper is partly counterbalanced by the stone and sand bin. The bin had both a sand and stone compartment, the material being taken from the barges alongside by a clam operated by a stiff leg derrick placed at the other end of the scow.

Measuring Car.—The measuring car, about 32 cu. ft. capacity, is shown in three positions, and its method of operation is well worth a careful examination. After being fed by the chute while in its lowest position, the cement being placed in from the side by hand, the car ascends the double-rail track and turns completely upside down. (See position 2 and 3). The intermediate position between 2 and 3 would show the rear wheels, first in the air, free from any rail, and next engaging the rail, which carries it while dumping. This apparatus, as designed by Mr. A. T. Gibson, was one of the most efficient parts of the plant.

The feed car dumped into the mixer hopper, and, after the materials were mixed, the concrete was dumped into a receiving hopper, from which the box on the ram was supplied. This supply hopper held about three batches of concrete, and allowed the mixer to be run almost continuously without depending on the speed of the ram, which was at times likely to be irregular.

The face mold is shown in place, in this sketch, with its loading ballast and lower layer of concrete in process of filling in. The ram is in its highest position, the box being ready to receive its supply, about 12 cu. ft., from the hopper. It will be noted that the strain on the ram arm is taken by a wire cable, operated with block and tackle by means of a winch from the frame above the mixer. A part of the frame is omitted from the sketch in order to show the measuring car.

Ram and Guide.—It will be remembered that one of the problems of this undertaking was to place the concrete between the old masonry wall and the forms for the concrete facing without clogging up the space near the top, and thus creating voids at the bottom of the wall. Had the thickness of the new wall been greater, or the surface of the old masonry

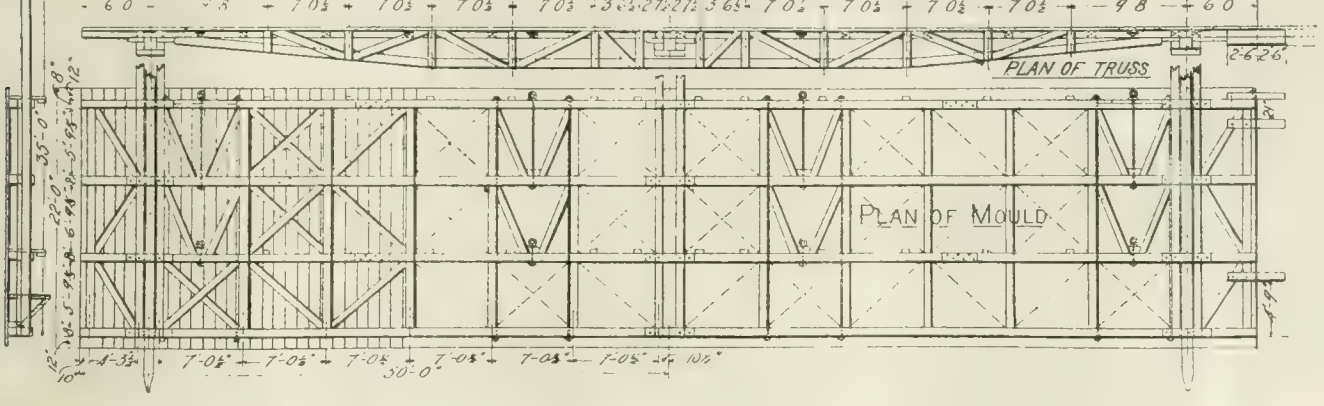

Fig. 3.—General Plans of Molds for Concrete Slope Walls.

the resultant pressure behind the forms would not be great, their large size, the flotation to be overcome and the force of the wash from passing steamers was sufficient to make the problem of their design and retention in place a difficult one. A special lifting scow for

wall, or the bank, been smoother, this difficulty would not have occurred. As a matter of fact, as results proved, there were places where the ram was not required.

In most of the work the guide was maintained at an angle of 45°, but it could be

adjusted to work nearer the vertical if required. The ram frame was made of timber, and the guide of 15-in. steel channels. The latter was carried in a gudgeon bearing attached to the inclined post support. The ram and box would drop by gravity, and was drawn back or controlled by a steel cable operated from the hoist.

The Plant in Operation.—The entire plant was ready for work early in June, 1907. In April the canal was unwatered for a portion of the month and gangs of men put on to prepare the slope wall, on the south side, for the new facing. All the loose stones were removed and the toe of the wall made ready to receive the bottom of the mold. Photographs were taken of any sections presenting unusual irregularities, and all the necessary data provided as to the condition and slope of the bank.

Placing the Molds.—The first section was started on the south bank, a few hundred feet above the Cote St. Paul Bridge, a location which, in so far as agitation of the water and limitation of working room were concerned, was the worst possible. The molds were floated opposite the site, raised up by the slings with the lifting derrick and lowered down in front of the bank. The diver then descended and checked the distance from the wall to the mold, guided the rail-ballast to place, and saw the toe properly braced with large flat stones lowered down for that purpose. The top of the mold was placed in alignment by setting off the given distance from the base line. In some places the top of the bank or revetment wall was so badly washed that it was not possible to take a line from it. The top of the mold was secured to the bank by timber braces and cables to anchor blocks placed at convenient points.

Operating the Ram.—After the molds were ready, the mixing scow was floated into place, the arm run out over the bank and moored at rest over the longitudinal beams arranged to slide it forward on, when the scow was moved. Tests were now made in lowering and raising the ram, and, beyond the usual stiffness expected in new machinery, everything worked satisfactorily.

Results of the Work.—An examination of the work, after unwatering the canal on the April following the first season's operations, showed satisfactory results, and several points are worth noting. First, that the placing of the concrete had been continued too late in the fall (to Oct. 24), and as a result of the condition of the water (its low temperature) the concrete of this section, compared with the other concrete, was found to be quite weak. The concrete placed in September had set up hard, and withstood the action of the ice when the water was let out of the canal in April, but the wall placed late in October had grooves cut into it by the ice sliding down, and on this account cost the contractors a considerable sum to refinish the surface.

Second, while some portions of the wall near the water-line had been acted upon by the wash of the waves from passing steamers, and looked rough, it was very hard and firm. The projecting stone from the ballast, particularly those pieces longer than 2 in., had secured such a grip in the wall that it was impossible to dislodge them. The lower portion of the face was quite smooth, but the slope made by each section of concrete laid, as the scow was moved ahead, was discernible. It showed that sections of over 8 ft. before moving the plant were too long. The top surface, usually flooded for a portion of the time after being finished, showed no signs of scumming, but a portion finished late in October one year, followed by rather severe cold in November, was found, after the snow had melted in the following spring, to have peeled to some extent. The warm sun of April, when the canal was unwatered, had the effect of hardening up any portions of the wall that had been delayed in hard set by the coldness of the water. Laitance, or scumming, of the concrete surface had not been found to any extent on this work, either in the locks, basins or in the general foundation work.

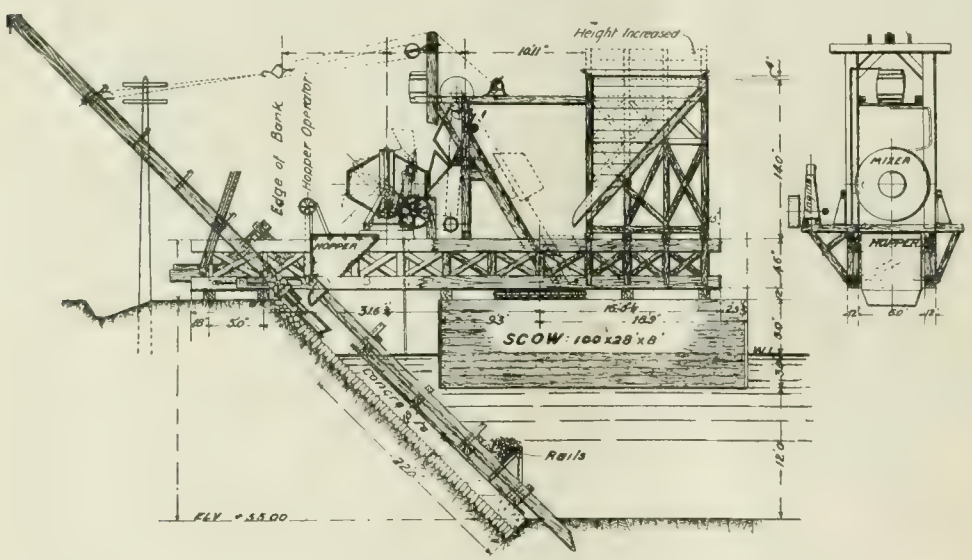

Fig. 4.—Plan Showing Plant for Constructing Concrete Slope Walls.

The information thus gained was made use of during the second season of the work. The scow was moved ahead about every 8 ft. and additional precautions taken to prevent the steamers creating such heavy wave action by making them slow down at a greater distance from the plant. The work was discontinued earlier in October, instead of waiting till the water had become too cold.

On examining the second season's operations on the following April, good results were found all along the wall, and the finish at the bottom was remarkably smooth. The ice had no injurious effect. The stone ballast was exposed in portions of the face, but only slight repairs were required. The action of the ice is one reason for making the concrete facing on the Lachine Canal so thick. About one mile of the concrete facing on the north side was laid with a view to stopping a heavy leakage through the bank. The result was entirely successful.

Cost of Operating the Plant.—An analysis of the cost of the work, to be of value to an engineer, must cover the details of the operating gangs required for each part of the plant, and give the results, the combined units accomplished, in a given time. The cost of materials, sand, stone, coal, oil, etc., will depend more or less on local circumstances, and need not be considered here. The general experience is that a large plant requires a number of extra men, not usually provided for when the plan is designed. It must also be remembered that the time spent in getting ready and laying up, if the operations go over more than one season, must not be overlooked, as in many cases this is an expensive item, and unusually so with a floating plant in this country. The gangs employed on this plant were as follows:

Lifting Scow:
1 foreman.
4 cranesmen.
1 driver.
2 assistants.

8 total.

Mixing and Depositing Plant:
1 hoist runner.
1 fireman.
3 trimmers for stone and sand barges.
1 mixer operator.
1 measuring and feeding materials to car.
1 car operator.
2 handling cement from barge to scow
1 opening cement bags.
1 feeding cement to car.
1 operator for ram.
1 operating door of bucket.
1 collecting empty cement bags.

15 total.

Men Employed on Bank and Scows:
1 carpenter.
4 helpers.
1 leveling concrete surface.
1 foreman sand, stone and cement barges.
10 laborers sand, stone and cement barges.

17 total.

Supervising Staff:
1 general superintendent.
1 master mechanic.
2 assistant mechanics.
1 carpenter foreman.

5 total.
55 grand total.

The transportation plant consisted of two tugs, eight or nine barges, including covered-in barges or scows for cement storage, and a barge for coal. The cost of this part of the outfit would be probably charged up to the cost of supplies, etc., and need not be considered here. A small repair gang was generally required, and kept on call for repairing the floating plant. This latter item is one that should be carefully considered and allowed for on similar plants. Some contractors, the author has observed, neglect this, but it was not so with the contractors for this work. One good carpenter and three or four helpers should be provided for the maintenance of a plant of this kind, even if new at the start.

The capacity of the plant averaged about 200 cu. yds. per day of 10 hours. This was sufficient to fill in behind about one length and a third of the forms used—that is, about 130 ft., lineal, of finished wall surface each day. The record is about as follows:

	Cu. yds.
1907, from June 5th to Oct. 24th	20,000
1908, from May 15th to Oct. 17th	30,000
1909, from May 12th to June 21st (finish)	6,000
Total	56,000

The time from the 1st of May in each year till the date of beginning work was spent in getting the plant in commission. This bears out the remarks previously made regarding the cost of getting ready and laying up floating plants.

On the completion of the work on the Lachine Canal the plant was removed to the Soulanges Canal, where the contractors had secured a contract for a similar piece of work. The slope of the walls, however, in the latter case was flatter than those on the Lachine Canal, but with some slight changes, the author is informed, highly satisfactory work was done.

Conclusions.—The three seasons' experience in laying concrete under water is sufficient to show that there is practically no limit to this class of work, provided the space can be confined and heavy currents overcome.

The "mix" should be, in the majority of cases, what might be termed a "wet putty mix," and experience shows that more washing out will occur if the "mix" has a tendency to be too dry rather than too wet. A few tests will show what percentage of water is best suited to the grade of materials used.

The author is indebted to Mr. A. T. Gibson, Toronto, the engineer for the contractors, and to Messrs. Haney, Miller, Quinlan & Robertson for permission to use the original drawings of the plant. The work was carried on under the supervision of the Department of Railways and Canals, through Mr. E. Marceau, the superintending engineer of the Quebec canals, and the author as engineer in charge of the Lachine Canal. Mr. Angus W. Robertson was the direct representative of the contractors on the site.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

A Central-Control, Electrically-Operated Car Haulage for Canal Work with Some General Costs.

A considerable part of the clay excavated from the North Shore Drainage Canal, Chicago, will in time be used by the National Brick Co. for making brick. This company has the contract to remove the spoil banks for a part of the canal through the city of Evanston, Ill., and also has a contract for excavating another part of the canal known as Section 8A. At present the work of excavation is going on at a rate required by the brick company to obtain only as much clay as it uses for the manufacture of brick. After the canal is completed the company will concern itself with the removal of the spoil banks left on other sections.

For the work of excavation proper, two 70-ton steam shovels are used and these are worked side by side in the cut and up against the dead end of the canal section. The distinctive feature of the plant is that the clay is hauled by motor-driven dump cars, moving in a continuous circuit and operated by a central-control electric haulage system. Car movements are controlled, except during dumping, by one man located in a tower in such a position as to command a general view of the work. This is one of the first applications of this system on contract work. It is claimed that the cost is not more than that of a haulage system of equal capacity equipped with locomotives (which latter would require at least three times the number of cars), while the cost of operation is materially lower than that for the locomotive haulage system. The equipment for this work consists of a power plant, 10 cars, and about a mile of narrow-gage track.

View on North Shore Channel Showing Spoil Car Operated by Central-Control Electrical Haulage.

The power plant consists of a 55-KW. generator belted to a 60-HP. engine. This plant supplies current for lights and for power. The current is carried on a third rail, of 12 lbs. section, which is placed in the center of the track. The tracks are of 30-lb. rail and 3-ft. gage.

The cars are of 3 cu. yd. capacity and their weight, when empty, is about 4,400 lbs. Each car is equipped with a single motor of about 12 HP. capacity and with contact shoes taking current from the third rail. The motors are of special design, and each has in connection with it a solonoid brake which forms a part of the electric control system. The brakes and controlling mechanism are operated by current taken from the third rail at a reduced voltage from that for normal propulsion.

The track arrangement on which these cars are operated is merely a double track with a cross-over at each end. At the loading end the track ends in a 30-ft. stub lying between the steam shovels. The loaded cars pass from here for a short distance on level grade, but in rising out of the canal cut the track is on a temporary trestle laid at a 12 per cent grade. The tracks pass along the bank of the canal to the brickyard and up again onto a trestle, where they are dumped by hand. A view of a car, taken in the early part of the canal work, is shown by the accompanying cut.

The novel feature of the haulage system is the control of all the cars by one man from a central point. The control of the cars consists of, starting them from the shovel, bringing them up the incline and along the top of the canal bank to the dumping platform and starting them on their downward trip. In case of emergency a car may be stopped or started on any portion of the track, but ordinarily the operation is continuous. Upon the down-grades the car is automatically governed as to speed, usually requiring no attention from the operator. The car by its momentum, on down-grade, becomes its own motive power and the motor becomes a generator. The motors are series wound and it is only necessary to reverse the armature connection to make them act as generators. A certain amount of resistance is mounted upon the car and so adjusted as to form sufficient electrical load upon the motor, working as a generator, to hold the car to a certain calculated speed. This operation forms the "dynamic brake" and will never allow a car under and condition to attain a greater speed on down-grade than this set speed. The conductor rail is divided into sections (separated by insulated joints), each section having independent connection with the controlling apparatus at the tower, or control station. Thus the cars on each section can be controlled independently of those on any other section. With more than one car on a section, however, all these cars are controlled as a unit. It is the duty of the tower man to keep the shovels supplied with an empty car at all times and so to distribute the empty cars on their return to the shovels that there will be continuous operation without "bunching" the cars.

The advantage of the operation of individual cars over that of trains is quite apparent. When one car is loaded it is not compelled to wait for the other cars to be loaded, as is the case where cars are hauled in trains. A car loaded at the shovel will be 1,000 ft. on its way before the next car is loaded. This makes it possible to keep all the cars working all the time and avoids keeping more than one car waiting for loading or unloading at any one time. It is claimed that this system operates with only one-third of the cars required when trains are used. Another advantage is that these cars, on account of their light weight as compared to a dinky engine required for a train, do not require as heavy rails nor so much labor to keep tracks in condition and ballasted as is required where engines are used.

The outlay for this equipment was about $28,000. During the first year the maintenance cost was abnormally high, due to the fact that no electrical man had been employed to look after the equipment. During the second year, however, a careful cost was kept on the maintenance and the cost given amounted to $505 for the entire year. The system used is the invention of Mr. F. E. Woodford, President Woodford Engineering Co., Chicago, Ill.

Method of Constructing Shield Driven Cast Iron Lined Tunnels Under the North River With Itemized Records of Labor Force, Wages and Time of Various Operations.*

The description relates to the construction of 12,255 ft. of circular cast iron lined tunnel driven by shields and compressed air. The main ruling type adopted for the tunnels under the river, and in the soft water-bearing ground for some distance on the shoreward side of the river lines, consists of two parallel metal-lined tunnels, circular in cross-section, each tunnel being 23 ft. outside diameter, and the two tunnels 37 ft. apart from c. to c. The metal lining is of cast iron (except for a few short lengths of cast steel) and of the usual segmental type, consisting of "rings" of iron, each ring being 2 ft. 6 ins. in length, and divided by radial joints into eleven segments, or "plates," with one "key," or closing segment, having joints not radial but narrower at the outside circumference of the metal lining than at the inside. The whole structure is joined, segment to segment, and ring to ring, by mild-steel bolts passing through bolt holes in flanges of all four faces of each segment. The joints between the segments are made water-tight by a caulking of sal-ammoniac and iron borings driven into grooves formed for the purpose on the inner edges of the flanges. The clearances between the bolts and the bolt holes are also made water-tight by using grummets or rings of yarn smeared with red lead, having a snug fit over the shank of the bolt and placed below the washer on either end of each bolt. When passing through ground more or less self-sustaining, the space outside the iron lining (formed by the excavation being necessarily rather larger than the external diameter of the lining itself) was filled with grout of 1:1 Portland cement and sand forced by air pressure through grout holes in each segment. These holes were closed with screw plugs before and after grouting. Table I shows the chief quantities of work in the river tunnels.

Methods of Construction.—First, it may be well to point out the sequence of events as they developed in this work. These events may be divided into six periods: (1) Excavation and iron lining: June, 1903, to Nov., 1906; (2) Caulking and grummeting the iron lining: Nov., 1906, to June, 1907; (3) Surveys, tests and observations: April, 1907, to April, 1908; (4) Building cross-passages and capping pile bores: April, 1908, to Nov., 1908; (5) Placing the concrete lining: Nov., 1908, to June, 1909; (6) Cleaning up and various small works: June, 1909, to Nov., 1909. The tunnels were under an average air pressure of 25 lbs. per sq. in. above normal for all except periods 5 and 6, during which times there was no air pressure in the tunnels. All the work will be described in this paper except that under Period 3.

Manhattan Shield Chambers.—The Manhattan shield chamber construction will be first

*From a paper by H. B. M. Hewett and W. L. Brown, Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 690.

TABLE I. QUANTITIES OF WORK IN SUBAQUEOUS TUNNELS.

Description, Quantity, Length, Etc.		Type. Manhattan shield chambers.	Cast iron, ordinary pocketless.	Cast iron, ordinary pocket.	Cast iron, heavy pocketless.	Cast steel, ordinary pocketless.	Total.
Length, in feet.		50.00	4,374.99	2,146.3	5,522.05	152.66	12,235.00
Excavation, in cubic yards.	Total	1,884	67,344	33,038	85,001	2,349	189,616
	Per linear feet	31.9	15.4	15.4	15.4	15.4	.....

described. During the progress of excavation the location of the New York shield chambers was moved back 133 ft., and when the location had been finally decided, there was a middle top heading driven all through the length now occupied by the shield chamber. Narrow cross-drifts were taken out at right angles to the top heading, and from the ends of these the wall-plate headings were taken out. Heavy timbering was used, as the rock cover was only about 6 ft., and the whole span to be covered was 60 ft. The process adopted was to excavate and timber the north side first, place the iron lining, and then excavate the south side, using the iron of the north side as the supports for the north ends of the segmental timbering of the south. The only incident of note was that on Oct. 20, 1904, the rock at the west end of the south wall-plate heading was pierced. Water soon flooded the workings, and considerable disturbance was caused in the New York Central railroad yard above. The cavity on the surface was soon filled in, but to stop the flow of mud and water was quite a troublesome job.

The excavation was begun on May 24, 1904, and finished on May 15, 1905. The segments were placed by an erector consisting of a timber boom supported by cross-timbers running on car wheels on longitudinal timbers at each side of the tunnel. Motion was transmitted to the boom by two sets of tackle, and the heavy (5,000-lb.) segments were easily handled. The erection of the lining was started on Feb. 4, 1905, and finished on June 14, 1905.

While the shield chambers were being excavated, bottom headings were run along the lines of the river tunnels and continued until the lack of rock cover prevented their being driven further. These were afterward enlarged to the full section as far as possible. The typical working force (ten-hour shifts) in the shield chambers was as follows:

Drilling and Blasting:	
1 Foreman at	$3.50
6 Drillers at	3.00
6 Drillers' helpers at	2.00
1 Blacksmith at	3.50
1 Blacksmith's helper at	2.25
1 Powderman at	2.00
1 Waterboy at	2.00
1 Nipper at	2.00
1 Machinist at	3.00
1 Machinist's helper at	1.80
Mucking:	
1 or 2 Foremen at	3.00
16 Muckers at	2.00

Erection of Shields.—The tunneling shields consist essentially of two parts, the structural steel work and the hydraulic fittings. The former was made by the Riter Conley Manufacturing Co., of Pittsburg, Pa., and put up by the Terry & Tench Co., of New York city; the hydraulic fittings were made and put in by the Watson-Stillman Co., of New York city.

On the New York side, the shields were built inside the iron lining of the shield chambers, hence no falsework was needed, as the necessary hoisting tackle could be slung from the iron lining; at Weehawken, however, the erection was done in the bare rock excavation, so that timber falsework had to be used. The assembly and riveting took about two weeks for each shield; the riveting was done with pneumatic riveters, using compressed air direct from the tunnel supply.

After the structural steel had been finished, the shields, which had hitherto been set on the floor of the chambers in order to give room for working over the top, were jacked up to grade; this involved lifting a weight of 113 tons. While the hydraulic fittings were being put in the shields were moved forward on a cradle, built of concrete with steel rails embedded, on which the shield was driven for the length in which the tunnel was in solid rock.

The installation of the hydraulic fittings took from 4 to 6 weeks per shield. The total weight of each finished shield was about 193 tons. The typical force (ten-hour shifts), working on shield erection was as follows:

Shield Erection. (Terry & Tench.)	Per day.
1 Superintendent at	$15.00
4 Foremen at	5.50
1 Timekeeper at	2.50
2 Engineers at	4.50
34 Iron workers at	4.50
7 Laborers at	2.25
Hydraulic Work: (Watson-Stillman Co.)	
4 Mechanics at	4.00
General Labor: (O'Rourke Eng. Cons. Co.)	
1 Inspector at	4.00
1 Foreman at	4.00
8 Laborers at	2.00
1 Engineer at	2.50

After the shield was finished and in position, the first two rings of the lining were erected in the tail of the shield. These first rings were then firmly braced to the rock and the chamber lining; then the shield was shoved ahead by its own jacks, another ring was built, and so on.

The description of the actual methods of work in the shield-driven tunnels can now be given; this will be divided generally into the different kinds of conditions met at the working face, for example, Full Face of Rock, Mixed Face, Full Face of Sand and Gravel, Upper River Bulkhead, and Full Face of Silt. The last heading is the one under which by far the longest length of tunnel was driven, and, as not much has hitherto appeared descriptive of the handling of a shield through this material, considerable space will be devoted to it.

Full Face of Rock.—As much as possible of the rock excavation was done before the shields were installed. On the New York side, about 146 ft. of tunnel was completely excavated, with 71 ft. of bottom headings beyond that, and at Weehawken, 58 and 40 ft. of tunnel and heading beyond, respectively. This was chiefly done to avoid handling the rock through the narrow shield doors. Test holes were driven ahead at short intervals to make sure that the rock cover was not being lost, but nevertheless, at Weehawken, on Feb. 14, 1905, a blast broke through the rock and let the mud flow in, filling the tunnel for half its height for a distance of 300 ft. from its face.

Throughout the rock section the shield traveled on a cradle of concrete in which were embedded either two or three steel rails. In the portion in which the whole of the excavation had been taken out, it was only necessary to trim off projecting corners of rock. In the portion in which only a bottom heading had been driven, the excavation was completed just in front of the shield, the drilling below axis level being done from the heading itself, and above that from the front sliding platforms of the shield. The holes were placed near together and drilled short, and very light charges of powder were used, so as to lessen the chance of knocking the shield about too much. In this work the small shield doors hampered the work greatly, and it might have been well to have provided a larger bottom opening which could have been subdivided or partly closed when soft ground was met; on the other hand, the quantity thus handled was small, owing to the fact that the greater part of the rock was excavated before the shields were installed. The space outside the lining was grouted with a 1:1 mixture of Portland cement and sand. Large voids were hand-packed with stone before grouting. The details of grouting will be described later.

A typical working gang is given herewith. Two such gangs were worked per shield per 24 hours, 10 hours per shift. All this work was done under normal air pressure.

General:	Per mo.
½ Tunnel superintendent at	$200.00
	Per day.
1 Assistant tunnel superintendent at	$5.00
1 General foreman at	5.00
½ Electrician at	3.50
½ Electrician's helper at	3.00
½ Pipefitter at	3.00
½ Pipefitter's helper at	2.75
Drilling:	
1 Foreman at	5.50
3 Drillers at	4.00
3 Driller's helpers at	3.00
1 Nipper at	2.50
½ Waterboy at	2.50
½ Powderboy at	2.75
Mucking:	
1 Foreman at	3.50
8 Muckers at	2.75
Erecting Iron and Driving Shield:	
1 Erector runner at	4.00
3 Iron workers at	3.00

The duties of such a gang were as follows: The tunnel superintendent looked after both shifts of one shield. The assistant or "walking boss" had charge of all work in the tunnel on one shift. The general foreman had charge of the labor at the face. The electricians looked after repairs, extensions of the cables, and lamp renewals. The pipefitters worked in both tunnels repairing leaks in pipes between the power house and the working faces, extending the pipe lines, and attending to shield repairs, and in the latter work the erector runner helped. The drillers stuck to their own jobs, which were not subject to interruption as long as the bottom headings lasted. One waterboy and one powderboy served two tunnels. The muckers helped the iron men put up the rings of lining, as well as doing their own work. The iron men tightened bolts, whenever not actually building up iron. The list does not include the transportation gang, which will be described under its own heading.

The rate of progress attained was 4.2 ft. per day per shield where most of the ex-

cavation had been done before, and 2.1 ft. where none had been done before. When the shields had got far enough away from the shield chamber, and before rock cover was lost, the first air-lock bulkhead walls were put in.

The specifications required these walls and all their fittings to be strong enough to stand a pressure of 50 lb. per sq. in. Accordingly, all the walls were of concrete, 10 ft. in thickness, except the first two, which were 8 ft. in thickness, and grouted up tight. There were three locks in each bulkhead wall capable of holding men, namely, the top or emergency lock which is set high in order to afford a safe means of getting away in case of a flood; this lock was used continuously for producing the lines and levels into the tunnels. It was very small and cramped for this purpose, and a larger one would have been better, both for lines and emergencies. This lock was directly connected with the overhead platform (also called for in the specifications) which ran the whole length of the tunnels. Side by side, on the level of the lower or working platform of the tunnels, were the man lock and the muck lock. In addition a number of pipes were built in to give access to the cables and for passing pipes, rails, etc., in and out.

After each tunnel was about 1,200 ft. ahead of the first walls, a second wall was built just like the first, and no others were put in, so that altogether there were eight walls. This second wall not only gave an added safeguard to the tunnel, but enabled the air pressure at the working face to be divided between the two walls, and this compression or decompression in stages, separated by a spell of walking exercise, was found to be very good for the health of those working in the air.

Mixed Face.—When the rock cover became so thin that it was risky to go on without the air pressure, the air pressure was turned on, starting with from 12 to 18 lb. which was enough to stop the water from the gravel on top of the rock. At first, when the surface of the rock was penetrated, the soft face was held up by horizontal boards braced from the shield until the shield was shoved. The braces were then taken out and, as soon as the shield had been shoved, were replaced by others. As the amount of soft ground in the face increased, the system of timbering was gradually changed to one of 2-in. poling boards resting on top of the shield and supported at the face by vertical breast boards, in turn held by 6 by 6-in. walings braced both through the upper doors to the iron lining and from the sliding platforms of the shield. The latter were in their forward position before the shield was shoved, the pressure being turned off and the exhaust valves opened just before the shove began. As the shield went ahead, the platform jacks gradually exhausted and thus held enough pressure on the face to keep it up. Fig. 1 is a sketch of this method.

In driving through mixed ground a typical working gang was about as follows:

General:	Per mo.
⅓ Tunnel superintendent at	$300.00
	Per day.
1 Assistant tunnel superintendent at	$5.00
1 General foreman at	5.00
½ Electrician at	3.50

Erecting Iron and Driving Shield:	
1 Erector runner at	3.25
3 Iron workers at	3.00

The average rate of progress was 2.6 ft. per day. In this case there were three such gangs, each on an 8-hour shift.

Full Face of Sand and Gravel.—This condition of affairs was only met at Weehawken. Two systems of timbering were used. In the first system, Fig. 1, the ground was excavated 2 ft. 6 ins. ahead of the cutting edge, the roof being held by longitudinal poling boards, resting on the outside of the skin at their back end and on vertical breast boards at the forward end. When the upper part of the face was dry, it was held by vertical breast boards braced from the sliding platform and through the shield doors to cross-timbers in the tunnel; the lower part, which was always wet, was held by horizontal breast boards braced through the lower shield pockets to cross-timbers in the tunnel. This system worked all right as long as the ground in the top was sandy enough and had sufficient cohesion to allow the polings to be put in, but, when the upper part was in gravel, thus making it impossible to put in the longitudinal polings or the vertical breasting, the second system came in. Here the excavation was only carried 1 ft. 3 ins. (half a shove) ahead of the cutting edge, and the longitudinal polings were replaced by transverse boards supported by pipes which were placed in the holes provided in the shield to accommodate some telescopic poling struts which had been designed but not made. These pipes acted as cantilevers, and were in two parts, a 2½-in. pipe wedged tight into the holes and smaller pipes sliding inside them. After a small section of the ground had been excavated, a board was placed against it, one of the pipes was drawn out under it, and wedges were driven between it and the board. These polings were kept below the level of the hood, so that when the shield was shoved they would come inside of it; in addition, they were braced with vertical posts from the sliding platforms. The upper part of the face was held by longitudinal breast boards braced from the sliding platform by vertical "soldier" pieces. The lower part of the face was supported by vertical sheet-piling braced to the tunnel through the lower doors. Sometimes two rows of piling were used, but generally one, as shown in Fig. 1. Notwithstanding the fact that the breasting was only 1 ft. 3 ins. ahead of the hood, the shield was moved its full stroke of 2 ft. 6 ins. the ground around the cutting edge of the hood being scraped away by men working bars in the place from which the temporary breast boards at the circumference had been removed. The back pressure on the sliding platform jacks, when the exhaust valves were only partly open, offered a good deal of resistance, and held the face as long as the movement of the shield was continuous.

On one occasion, when for some reason the shield was stopped with the shove only partly done, and the exhaust valves had not been shut off, the platforms continued to slide and allowed the face to collapse; the shield platforms and doorways, however, caught the falling sand and gravel and the flow choked itself.

As soon as the rock surface was penetrated and the sand and gravel were met,

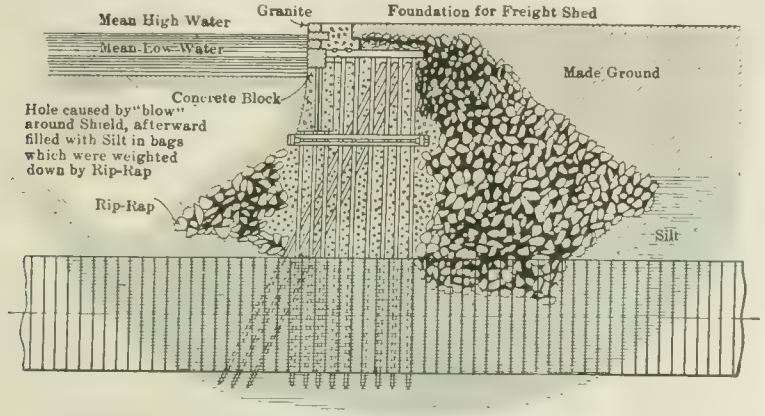
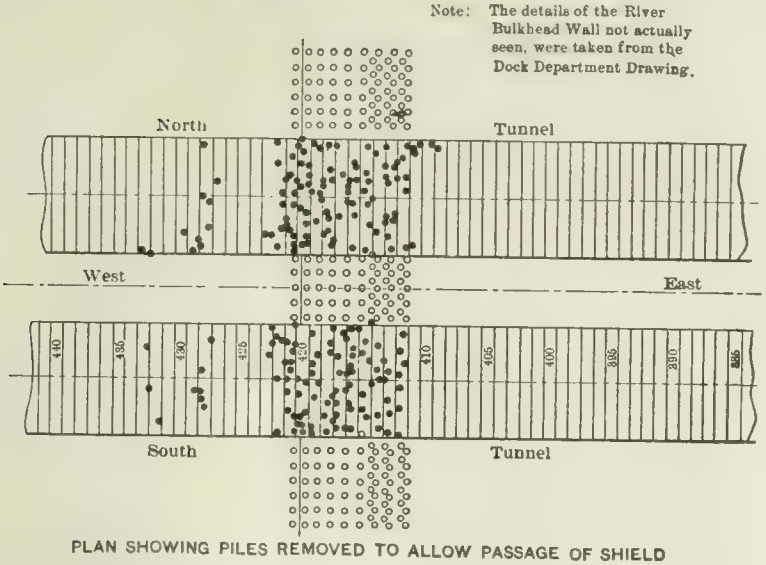
tions were not nearly as good. The heavy masonry bulkhead was supported on piles and rip-rap, as shown in Fig. 2. The line of the top of the shield was about 6 ft. above the bottom of the rip-rap, the spaces between the stones of which were quite open and allowed a free flow of water directly from the river. As soon, therefore, as the cutting edge of the shield entered the rip-rap there was a blow, the air escaping freely to the ground surface behind the bulkhead and to the river in front of it. Clay puddle, or mud made from the excavated silt, was used in large quantities to plug up the interstices between the stone in the working face, the air pressure being slightly greater than



CROSS-SECTION OF RIVER BULKHEAD WALL ON AXIS OF NORTH TUNNEL



PLAN SHOWING PILES REMOVED TO ALLOW PASSAGE OF SHIELD

Fig. 2.—Sketch Showing Method of PassingTunnels Under Bulkhead Walls.

that needed to keep out the water holding it in place. The excavation of the rip-rap was a tedious affair, for it had to be removed one stone at a time and the spaces between the newly exposed stones plugged with mud immediately. One man stood ready with the mud while another loosened the stones with a bar. When the shield had advanced its own length in the rip-rap, another point for the escape of the air was exposed at the rear end of the shield. This loss was closed at the leading end of the last ring with mud and cement sacks.

As long as the shield was stationary it was possible, by using these methods and exercising great care and watchfulness, to prevent excessive loss of air; but, while the shield was being shoved ahead, the difficulties were much increased, for the movement of the shield displaced the bags and mud as fast as they were placed, and it was only by shoving slowly and having a large number of men looking out for leaks and stopping them up the instant they developed that excessive loss of air could be prevented. In erecting the iron lining, as each segment was brought into position it was necessary to clean off the leading surface of the previous ring and the adjacent portion of the tail of the shield; this was always accompanied by a slight "blow," and for some time the air pressure in the tunnel dropped from 25 to 20 lbs. that is, from greater than the balancing pressure to less, every time a segment was placed, and on two occasions the "blow" became so great that the tunnel pressure was reduced considerably further, and in consequence the water from the river rushed in and was not stopped until it had risen about 4 ft. in the tunnel invert. On such occasions the surface of the river was greatly disturbed, rising more than 20 ft. in the air in a sort of geyser. A large quantity of grout (about 2,500 bbls. of cement and a similar quantity of sand in the North Tunnel and 1,000 bbls. in the South Tunnel) was used at this point; it was forced through the tunnel lining immediately behind the shield, greatly reducing the loss of air and helping to bind the rip-rap together.

When the shield had traveled 25 ft. through the rip-rap, the piles which support the bulkhead were met. One hundred of these which were spaced at 3-ft. centers in each direction, were cut out of the path of each shield in a distance of 35 ft. The presence of the piles caused considerable extra labor, as each pile had to be cut into several pieces with axes to enable it to be removed through the shield doors, otherwise they presented no difficulties. It was not necessary to timber the face, as the piles supported it most effectively.

When the river line had been passed, the "blow" still continued, and as there was no heavy ground above the tunnel the light silt was carried away into the water by the escaping air. At one time the cover over the crown of the tunnel was reduced to such an extent that for a distance of 30 ft. there was less than 10 ft. of very soft silt, and in some places none at all. Therefore, the shield was stopped and the air pressure reduced until it was less than the balancing pressure; the blow then ceased, and about 28,000 cement bags filled with mud were dumped into the hole (the location made it impossible to dump them *en masse* from a scow). They were then weighted down with rip-rap. This sealed the blow, and the work was continued without any further disturbance from this source. Just before the blow reached its maximum it was found that two of the piles which had been encountered were directly in the path of one of the proposed screw-piles. It was therefore decided to pull these, and this was done with two 40-ton hydraulic jacks supported by the upper sliding platforms and acting on a horizontal timber which was connected to the piles by tie-rods and chains. The working force here was similar to that employed in the sand and gravel section previously described.

In Full Face of Silt.—A full face of silt was first met under the New York Central Railroad freight yard on the New York side. Up to this point the ground passed through had been either solid rock or a mixed face of rock and gravel. In both of these the full excavation had to be taken out before the shield could be shoved, and the soft ground had needed timbering. When the rock, gravel, and hardpan gave place to a full face of silt, the timber was removed, all the shield doors were opened, and the shield was shoved into the ground without any excavation being done by hand ahead of the diaphragm. As the shield advanced, the silt was forced through the open doors into the tunnel. After the work had gone on in this way for some time, taking in about 90 per cent of the full volume of the tunnel excavation per foot forward, the air pressure was raised from 20 to 22 lbs. The result was that the silt in the face got harder and flowed less readily through the shield, and the amount taken in fell to about 65 per cent of the full volume. This manner of shoving at once caused a disturbance on the surface and the railroad tracks above the tunnel were raised, so that the pressure was lowered to 16 lbs. then the muck got softer and the full volume of excavation was taken in; after a while the pressure was again raised to 20 lbs.

The forcing of the shield through the silt resulted in a rising of the bed of the river, the amount that the bed was raised depending on the quantity of material brought into the shield.

If the whole volume of excavation was being brought in, the surface of the bed was not affected; when about 50 per cent was being taken in, the surface was raised about 3 ft.; if the shield was being driven blind, the bed was raised about 7 ft.

The number of open doors was regulated so as to take in the minimum quantity of muck consistent with causing no surface disturbance. On the average, in the North Manhattan Tunnel, all the doors were open, but in the South Tunnel there were generally only five or six out of the total nine.

In front of the bulkhead wall at Manhattan the tunnels were under Pier No. 72. This structure was supported on wooden piles, some 80 ft. or more in length, which came down below the tunnel invert. The piles which lay directly in the path of the tunnels, with a few exceptions, had been pulled. In driving the tunnels through this section, great care had to be taken not to disturb the piles on either side of the tunnels, as they supported a heavy trestle used in disposing of the excavation from the open cut in the terminal yard. To avoid such disturbance, a large portion of the total excavation had to be taken through the shields.

The first shield which passed the river bulkhead was the south one at Weehawken. As soon as this line was crossed the silt was found to be much softer than behind the wall, in fact it was like a fluid in many of its properties. The fluidity could be changed by varying the tunnel air pressure; for example, when the air pressure was made equal to the weight of the overlying material (water and silt), the silt was quite stiff, and resembled a rather soft clay; but when the air pressure was from 10 to 15 lbs. per sq.

it lower, it became so liquid that it would flow through a 1½-in. grout hole in the lining, in a thick stream, at the rate of from 10 to 50 gals. per min. as soon as the plug was taken out. This was the point to which the contractor had long looked forward, as he expected to be able to close all his shield doors and drive the rest of the way across without taking in a shovelful of muck, as had just been done under the Hudson River, on the South Tunnel of the Hudson and Manhattan Railroad Company's Tunnels between Morton Street, New York City, and Hoboken, N. J. The doors were shut and the shield was shoved; the tunnel at once began to rise rapidly, notwithstanding that the heaviest possible downward leads that the clearance between the iron and the shield would allow were put on. At the same time, the pressures induced in the silt by the shield shouldering the ground aside caused the iron lining to rise about 2 in. as soon as the shield left it, and also distorted it, the horizontal diameter decreasing and the vertical diameter increasing by about as much as 1¼ in.

gang per shift of 8 hours per shield was as follows:

	Per mo.
General:	
⅓ Tunnel superintendent at	$300.00
	Per day
1 Assistant tunnel superintendent at	$6.00
1 General foreman at	5.00
½ Electrician at	3.50
½ Electrician's helper at	3.00
1 Foreman at	4.00
2 Pipefitters at	3.50
2 Pipefitters' helpers at	3.25
Mucking:	
1 Foreman at	4.00
6 Muckers at	3.00
Erecting Iron and Driving Shield:	
1 Foreman at	4.00
1 Erector runner at	3.50
4 Iron workers at	3.00
3 Laborers at	3.00

Three such shifts were worked per day and the air pressure averaged 25 lbs. per sq. in.

The increase in the number of pipefitters was due to the greatly increased speed, and also the steadily increasing length of completed tunnel. The three laborers in the erection gang spent their whole time tightening bolts. The rate of progress in the silt under the river per ring of 2½ ft. was 3 hrs. 21

tunnels in silt, a short description will be attempted, this description falling into three main divisions, namely, Shoving the Shield, Pushing Back the Jacks, and Erecting the Iron Lining.

Shoving the Shield.—This part of the work is naturally very important, as the position of the shield determines within pretty narrow limits the position of the iron built within it, hence the shield during its forward movement has to be guided very carefully. On this work certain instructions were issued for the guidance of the foreman in charge of the shield. These instructions were based on results of "checks" of the shield and iron's position by the engineering corps of the Company, and comprised, in the main, two requirements, namely, the leads that were to be got, and the quantity of muck to be taken in. The "lead" is the amount that the shield must be advanced further from the iron, on one side or the other, or on the top or bottom, as measured from the front face of the last ring of iron lining to the diaphragm of the shield. These leads are not necessarily

R. Tracks; R, Portable R. R. Tracks; S, Glass Bull's Eye; T, Cast Steel Cutting Edge; U, Inverted Rail for Trailing Platform; V, Electric Light Box; W, Pressure Gage; X, Movable Hood.

An anxious discussion followed these phenomena, as the effects had been so utterly unexpected, and a good many different theories were advanced as to the probable cause. It was thought that the hood of the shield might have something to do with the trouble. The shield was stopped, the hood removed, the doors were shut, and the driving continued. The same trouble was found, and it was impossible to keep to grade. Work was stopped, and the question was thoroughly debated; finally, on Jan. 31, 1906, the chief engineer directed that one of the shield doors be opened as an experiment and 50 per cent of the excavation taken in.

The effect was instantaneous, the shield began to come down to grade at once, and it soon became necessary to close the door partially and reduce the quantity of muck taken in in order to prevent the tunnel from getting below grade. The other troubles from distortion, etc., ceased at the same time.

It was soon found that a powerful aid in the guidance of the shield was thus brought to hand, for, if high, the shield could be brought down by increasing the quantity of muck taken in, if low, by decreasing it. From this time forward, the quantity of muck taken in at each shove was carefully regulated according to the position of the tunnel with regard to grade and the nature of the ground. The quantity varied from nothing to the full volume displaced by the tunnel, and averaged 33 per cent of the latter.

To regulate the flow, the bottom middle door was fitted with two steel angles behind which were placed 6 6-in. timbers. In this way the opening could be entirely closed or one of any size left. The muck flowed into the tunnel in a thick stream, and, by regulating the rate of shove, it could be made to flow just as fast as it could be loaded into cars.

In driving through the silt, the typical

min., exclusive of all time when work was actually suspended. For a considerable part of the time only two 8-hour shifts were worked, owing to a shortage of iron caused by the change in the design of the lining, whereby the original lining was changed to a heavier one, and, as the work was also stopped for experiments and observations, the average of the actual total time, including all the time during which work was suspended, was 5 hours 32 min. per ring, or 10.8 ft. per day.

The junction of the shields under the river was made as follows: When the two shields of one tunnel, which had been driven from opposite sides of the river approached within 10 ft. of each other, the shields were stopped, a 10-in. pipe was driven between them, and a final check of lines and levels was made through the pipe. Incidentally, also, the first through traffic was established by passing a box of cigars through the pipe from the Manhattan shield to that from Weehawken. One shield was then started up with all doors closed while the doors on the stationary shield were opened so that the muck driven ahead by the moving shield was taken in through the other one's doors. This was continued until the cutting edges came together. All doors in both shields were then opened and the shield mucked out. The cutting edges were taken off, and the shields moved together again, edge of skin to edge of skin. The removal of the cutting edge necessitated the raising of the pressure to 37 lbs. As the sections of the cutting edges were taken off, the space between the skin edges was poled with 3-in. stuff. When everything except the skins had been removed, iron lining was built up inside the skins, the gap at the junction was filled with concrete, and long bolts were used from ring to ring on the circumferential joint. Finally, the rings inside the shield skins were grouted.

In order to make clear the nature of the work done in building these shield-driven

true leads from a line at right angles to the center line, as the iron may have, and in fact usually does have, a lead of its own which is known and allowed for when issuing the requirements for the shove.

The foreman, knowing what was wanted, arranged the combination of shield jacks which would give the required leads and the amount of opening on the shield door which would give the required amount of muck. To see how the shield was going ahead, a man was stationed at each side at axis level and another in the crown. Each man had a graduated rod in which the marks were so distinct that they could be read by anyone standing on the lower platform. These rods were held against the shield diaphragm, and, as it advanced, its distance from the leading end of the last ring could be seen by the man in control of the jack valves. If he found that he was not getting the required leads, he could change the combination of jacks in action. As the time of a shove was often less than 10 min., the man had to be very quick in reading the rods and changing the jacks. If it was found that extensive change in the jack arrangement was wanted, the shove could be stopped by a man stationed at the main hydraulic control valve; but, as any such stoppage affected the quantity of muck taken in, it was not resorted to unless absolutely necessary.

If the quantity of muck coming in was not as desired, a stop had to be made to alter the size of the opening, and if, while this was being done, the exhaust valves were not closed quite tight, the silt pressure on the face of the shield would force it back against the iron. This fact was sometimes taken advantage of when a full opening did not let in the desired quantity, for the shield could be shoved, allowed to return, and shoved again.

The time taken to shove in silt varied greatly with the quantity of material taken in; for shoving and mucking combined, it

averaged 66 min., with an average of 13 cu. yds. of muck disposed of, or about 5 mins. per cu. yd. of material.

Pushing Back the Jacks.—This was a simple matter, and merely consisted in making the loose push-back connection to each jack as it had to be sent back. Some of the jacks became strained and bent, and had to be taken out and replaced. Where there was silt pressure against the face of the shield, the hydraulic pressure had to be kept on until the ring was erected. In such cases, only two or three jacks could be pushed back at a time, and only after a segment had been set in position, and the pressure taken on it, could the next jack be pushed back, and so on around the ring. The time between the finish of the shove (hydraulic pressure turned off) and the placing of the first segment, was occupied in pushing back the bottom jacks and cleaning dirt off the tail of the shield, and averaged about 14 min.

Erecting the Iron Lining.—As soon as the shove was over, the whole force, when in silt, set to work at building up the iron and then tightening the bolts so that the shield could be shoved again. A section of the tunnel with bolting and working platform is shown on Fig. 3.

In the early part of the work, when the ground was being excavated ahead of the shield, the whole force, with the exception of those working in front of the shield, was engaged in erecting the iron, but, as soon as this was done, most of the men returned to the mucking, and only the iron workers continued to tighten up bolts. On the other sections, where the shield was shoved into the silt without excavating ahead, as soon as the shove was completed, the whole force was engaged in the erection of the iron and the tightening of the bolts, until they were so tight that the shield could be shoved again for another ring.

The iron was brought into the tunnel on flat cars, two segments to the car, and was lifted from the car and lowered into the invert of the shield by a block and fall and chain sling. The bottom three or four segments were pushed around into position with the erector, the head simply bearing against the longitudinal flange without being attached to the segment; the upper segments, however, were attached to the erector, by using the expanding bar and the erector head designed by Mr. Patrick Fitzgerald, the Tunnel Superintendent. This was found to be a most convenient arrangement.

The single erector attached to the center of the shield was able to erect the iron as fast as it could be brought into the tunnel, and even when the weight of the segments was increased 25 per cent (from 2,060 to 2,580 lbs.) it always proved equal to its task, although occasionally one of the chains in the mechanism broke and delayed the work for an hour or so; but the sum of all the delays from this cause and from breaks and leaks in the hydraulic line only averaged 13 min. per ring. The operating valve which was first used was a four-spindle turning valve, but this was replaced by a sliding valve which was found to be much more satisfactory, both in ease of operation and freedom from failure.

As the iron was put into place, two of the middle bolts in each longitudinal flange and two in each circumferential one were pulled as tight as possible, and the others put in loosely; then, as soon as the ring was in position, as large a force as could be conveniently worked at one time was engaged in tightening the bolts. The shape of the tunnel depended on the thoroughness of the tightening of the bolts, and the shield was never shoved until the bolts in all the longitudinal flanges had been thoroughly tightened. In addition, all the bolts in the circumferential flanges below the axis were tightened, and at least three of the six in each segment above. After the shield had been shoved ahead, the bolts were found to have slackened, and, where the daily progress was four rings, or more, it was necessary to have a small gang of men always at this work.

In order to get at the bolts, special platforms were necessary, and throughout the greater part of the work, a traveling platform was used. This enabled the men to reach handily all parts of the seven leading rings. This platform was supported and moved forward on wheels fixed on brackets to the tunnel, and was pulled forward by connecting chains every time the shield was shoved. In the early part of the work it was not possible to use platforms, because, in order to maintain the correct circular shape of the iron lining, it was necessary to put in temporary horizontal turnbuckles at axis level. These, however, were very convenient for supporting the planks which were used as a temporary bolting platform for the sides of the tunnel, and a temporary platform resting on 6 6-in. timbers across the tunnel enabled the bolts in the crown of the tunnel to be reached, while the 6 6-in. timbers were left in to support the emergency platform previously described, which extended the entire length of the tunnel.

The time taken to erect the iron lining became shorter and shorter as the tunnel organization became more perfect and the force better trained, so that, whereas, in the early part of the work, it frequently took 6 hours to erect a ring, in the latter part, when the work was nearing completion, it was a common occurrence to erect a ring in 30 min. The average time in the "heavy iron" section, which included the greater part of the work under the river, was 1 hour 4 min. for the erection of the ring and 40 min. for tightening the bolts after that had been completed, so that the total time spent by the whole gang on erection and bolting averaged 1 hour 44 min. per ring, exclusive of the time spent by the small gang which was always engaged in tightening the bolts. The average time spent in erecting and bolting, for the whole length of the tube tunnels, was 2 hours 15 min. per ring.

The average time taken for each operation at all the working faces is given in Table II. The work has been subdivided into the different kinds of ground encountered. The progress, as shown by the amount of work done each month by each shield, is given in Table III.

Air Pressure.—The air pressure varied from 17 to 37 lbs. Behind the river line it averaged 17 lbs. and under the river 26 lbs. Behind the river lines the pressure was generally kept about equal to the water head at the crown, except where at Weehawken, as previously described, this was impossible. In the silt the pressure was much lower than the hydrostatic head at the crown, but if it became necessary to make an excavation ahead of the shield, for example at the junction of the shields, the air pressure required was about equal to the weight of the overlying material, namely, the water and the silt, as the silt, which weighed from 97 to 106 lbs. per cu. ft. and averaged 100 lbs. per cu. ft., acted like a fluid.

A ½-in. air line was taken direct from the working chamber to the recording gages in the engine-room, which enabled the engine-room force to keep a constant watch on the air conditions below. To avoid undue rise of pressure, a safety valve was set on the air line at each lock, set to blow off if the air pressure rose above that desired. The compressor plant was ample, except, as before described, when passing the gravel section at Weehawken.

Records were kept of the air supply, and it may be said here that the quantity of free air per man per hour was in general between 1,500 and 5,000 cu. ft., though in the open gravel where the escape was great it was for a time as much as 10,000 cu. ft. For more than half the silt period it was kept between 3,000 and 4,000 cu. ft., but when it seemed proved beyond doubt that any quantity more than 2,000 cu. ft. had no beneficial effect on health, no attempt was made to deliver more, and on two separate occasions for two consecutive weeks it ran as low as 1,000 cu. ft. without any increase in the number of cases of bends.

The amount of CO_2 in the air was also measured daily, as the specifications called for not more than 1 part of CO_2 per 1,000 parts of air. The average ranged between 0.8 and 1.5 parts per 1,000, though in exceptional cases it fell as low as 0.3 and rose to 4.0. The air temperature in the tunnels usually ranged from 55° to 60° F., which was the temperature also of the surrounding silt, though at times, in the earlier parts of the work when

grouting extensively in long sections of the tunnel in rock, it varied from 85° to 110° F.

Grouting.—Grout of one part of Portland cement to one part of sand by volume was forced outside the tunnel lining by air pressure through 1½-in. tapped and plugged grout holes formed in each segment for this purpose, wherever the ground was not likely to squeeze in upon the metal lining as soon as this was erected. That is to say, it was used everywhere up to the river line; between river lines it was not used except at the New York bulkhead wall in order to fill voids in the rip-rap, and at the point of junction of the shields where the space between the metal lining and the shield skins outside it was grouted. Cow Bay sand was used, and it had to be screened to remove particles greater than 1/10 in. in diameter, which would choke the valves. For later grouting work, namely, in the top of the concrete lining inside the metal lining, Rockaway Beach sand was used. This is very fine, and did not need screening; it cost more, but the saving of screening and the non-blocking of valves, etc., resulted in a saving.

The grout pipes were not screwed directly into the tapped hole in the segments, but a pipe containing a nipple and valve was screwed into the grout hole and the grout pipe screwed to the pipe. This prevented the waste of grout, enabled the valve to be closed and the grout pipe disconnected, and the pipe to be left in position until the grout had set. In the full rock section, 20 or 30 rings were put in without grouting; then the shield was stopped, the last two or three rings were detached and pulled ahead by the shield, a masonry stopwall was built around the outside of the last ring left in, and the whole 20 or 30 rings were grouted at one time. In the landward silt and gravel each ring had to be grouted as soon as the shield had left it, in order to avoid the flattening caused by the weight coming on the crown while the sides were as yet unsupported. The grout was prevented from reaching the tail of the shield by plugging up the space with empty cement bags, assisted by segmental boards held against the face of the leading ring by U-shaped clamps, fitting over the front circumferential flange of the ring and the boards, and tightened by wedges. The air pressure varied between 70 and 100 lbs. per sq. in. above normal.

The force consisted of one pipe fitter and one or two laborers employed part of their time. When a considerable length was being grouted at a time, as in the full rock section, many laborers were employed for a short period.

National Fire Protection Association.—The fourteenth annual meeting of the National Fire Protection Association will be held at the Hotel La Salle, Chicago, on May 17, 18 and 19. On the first date the reports presented for discussion will be those of the committees on manufacturing risks and special hazards, devices and materials, automatic sprinklers, fire protection coverings for window and door openings, hose, hydrants and valves, pumps, private fire supplies from public mains, and standard hose couplings and hydrant fittings. On the second day the committee reports for discussion will be those on signaling systems, cold storage warehouses, automobile garages, building codes and fireproof construction. On the third day the committees reporting will be those on theater construction and equipment, pneumatic conveyors of stock and refuse, and high-pressure fire service systems. There will also be a number of addresses at this meeting by architects and delegates to various conventions interested in fire protection work.

According to announcement reported to have been made by R. S. Lovett, President, Phoenix & Eastern Ry., construction work will be resumed on the gap between Winkleman and Carlos, Ariz., as soon as the Secretary of the Interior approves the plans for the construction of the line through the Box or Gila Canyon.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Methods of Resurfacing Worn Out Macadam Roads in New Jersey.

During the past year the Commissioner of Public Roads of New Jersey has given special attention to the repair of old macadam roads. In the recently issued report of Frederick Gilkyson, Commission, Mr. E. M. Vail, Assistant State Supervisor of Public Roads, describes the methods employed, as follows:

The method giving the best general satisfaction is to sweep the loose dirt from the stone bed to the shoulders, scarify or break up the surface of the upper course of stone, then spread and shape the old material to form a proper crown of the same curvature as the surface of the finished road, using a little new material where necessary.

Old roads are usually worn more in the center than at the edges of the stone bed; hence when the loosened stone is raked toward the center to form the crown, a shoulder of dirt is formed for the new stone which is to be added later. The shoulders are then cleaned and shaped for their entire width, the gutters properly attended to and the shrubbery and overhanging limbs of trees trimmed to at least twelve feet above the road at all points. It is especially necessary that this work be done in advance of the spreading of the new stone, so that the new work may be kept clear of dust and dirt of all kinds.

The roadway, having been thus prepared, is ready to receive whatever kind of resurfacing the specifications call for. One method is to spread a cushion of clean, sharp sand, followed by new, clean 1½-in. stone, cubical wooden blocks being used to insure a uniform depth. After rolling once, hot asphaltum binder is applied, followed by a light coat of clean ¾-in. stone, enough to keep the roller from picking up the stone. This first application of binder and ¾-in. stone is sometimes followed by another applied in the same manner.

In cases where the old material is properly rolled and shaped, as explained above, no depressions or irregularities appear in the new work, but the 1½-in. stone shows on the surface with just enough ¾-in. stone and asphaltum oil to fill the voids and bind the whole together.

It is frequently necessary to take up an excess of binder appearing on the surface by spreading a light layer of ¾-in. stone and screenings, carefully broadcasting it with shovels where needed. If sand is used to fill a part of the voids between the stones, it is very important that it be shaken down out of sight before the asphaltum binder is applied or the binder will not adhere to the stones.

Some local engineers and supervisors do not yet realize the importance of having each course of stone uniform in size and the same depth in all parts, and therefore allow the contractor to dump the new stone on the hard, dusty surface of the old road where it will not properly bind.

If the loose dirt has not been swept away or scarified and rattled down among the old stone by rolling, it mingles with the new stone and prevents the asphaltum binder from adhering.

The additional stone necessary to build up a crown on an old flat surface costs more than scarifying and reshaping, because the depth of the new stone varies, perhaps, from 1 to 6 ins.

The amount of asphaltum binder required varies according to the depth of loose stone to be treated. When too little is applied, dust will soon work in and render it impossible to properly bind the stone even with an additional amount of binder. An excess of binder will result in soft, spongy spots, from which melted asphalt will ooze on a hot day. It will therefore be readily seen that in a section varying from 1 to 6 ins. in depth it is almost impossible to determine the amount of binder required. In some cases only enough extra dirt is borrowed from the side of the road to form a narrow shoulder for the new stone instead of reshaping the entire shoulder to the gutter line as suggested. This causes an abrupt drop from the edge of the stone, which is liable to upset a vehicle.

The process just described is what is known as the penetration method, and gives very good results when exactly the proper material is obtained, heated and carefully applied in the right quantity. On account of the extreme care necessary from start to finish with the penetration method, it has been thought advisable on some of the more important roads to adopt the mixing method, even after considering the additional first cost.

For the mixing method the foundation and shoulders, or box, as it is commonly called, is formed in exactly the same manner as for penetration. Coarse stone, thoroughly coated by some one of the various mechanical methods, is then spread, cubical wooden blocks being used to aid in getting a uniform thickness before rolling, for when the roller has passed once over it, the material has set firmly together and it is difficult to fill up any slight depressions or roll down bumps.

This first course is followed by a thin second course of small stone coated in the same way, which is intended to fill up any spaces between the coarse stone and make a watertight road. In some processes even a third coat, consisting of treated stone dust, is lightly scattered or broomed on to make a finished surface.

Since most of the work to be performed, with money apportioned the various counties from the motor vehicle fund, will be by contract, it will be necessary for contractors who would successfully compete for this work, and, in fact, all state aid work, to provide themselves not only with standard 10-ton rollers, the regular wide-tired wagons and small tools, but a scarifier and a suitable outfit for asphaltum work. One roller and one scarifier have occasionally been made to do the work for two or three small jobs located in the same district. While we should encourage small contractors in every possible way, it is not fair to county or state to put up with the annoyances and delays consequent upon such work, and every contractor is now expected to set apart a full set of tools for each particular job contracted for.

Notes on Road and Street Work.

Effect of Moisture on the Wear of Macadam Roads.—At Valley Forge Park, near Philadelphia, there is no water supply for sprinkling purposes, and as a result the five miles of telford and macadam roads in the park are dependent upon precipitation for moisture. The rate of speed in the park for motor cars is ten miles per hour. In the woods where the roads never become entirely dry the effect of the motor traffic is not serious except at sharp turns, but out in the open, where there are stretches of road that are entirely without shade from sunrise to sunset, the motor cars even at that low speed are doing a great deal of damage.

Telford-Concrete Road.—The Pennsylvania State Highway Commission has put in several sections of concrete roads in locations where the road bed was liable to be subjected to washing by floods or high water. In one case a cloud burst tore off a section of the road leaving the telford exposed, and to meet such

a condition should it occur again, a concrete surfacing was applied. The concrete was made in a 1-3-5 mixture and was applied on top of the telford to a depth of 4 ins. It was then rolled and tamped until the slush came on top; ¼-in. to ¾-in. rock screenings free from dust were applied on top, and tamped until about half the stone was embedded in the slush. After this the surface was covered with screenings containing about 5 per cent of dust. On one portion of the road there was expansion joints; while on the other portion there was none. Mr. J. W. Hunter, State Highway Commissioner, states that the section without expansion joints is today the better section of the two.

Repairing and Resurfacing Tar Treated Roads.—The Metropolitan Park Board of Massachusetts has done much work in repairing and resurfacing roads that had previously been treated with tar preparations. Some of the roads in the Metropolitan Park District of Boston, particularly the Revere Beach Drive, have been re-treated three times, and the last surface has proved very satisfactory. Successful work seems to depend on preventing an excess of the tar compound collecting in the worn spots and depressions in the surface. The method used by the Metropolitan Park Board is to fill the holes or depressions with ¾-in. stone before applying tar compounds. This size stone will fill holes as shallow as ½ in. very nicely. After the road has been swept thoroughly, a sufficient quantity of ¾-in. stone is put in each little depression, care being taken that an excess of stone is not used. Considerable care is required to prevent this, as there is always a tendency with an untrained man to put in too much.

Tar-Construction for Residential Streets, Having Light Traffic.—The following method of Construction was adopted last summer at Cheltonham, England, for several miles of road carrying a light but continuous traffic in main residential thoroughfares. The road was scarified and a coat of new broken stone spread in the usual manner. This was steam-rolled with the application of a little water to bring up the binding material from the old road below in order partially to bind the new macadam. When the metal presented a clean and even surface and before the binding material from below reached the top, a thin layer of ¼-in. tarred chippings was spread over and swept into the interstices, and the road was again steam-rolled until thoroughly consolidated. A layer of tarred shippings, ¾-in. to ¼-in. gage, about ¾-in. thickness, was then spread and rolled to a finished surface. This was afterwards tar-painted with a view to making the road practically waterproof. The cost over and above the ordinary water-bound macadam road was at 19 cts. per square yard. Most of the roads made in this manner have been tolerably clean during the winter months and they are practically dustless. In one or two cases this method of construction proved unsatisfactory, but the work as a whole proved satisfactory during the trying winter months. The above note has been taken from an article by Mr. J. S. Pickering, Borough Surveyor, in a recent issue of The Surveyor.

Repairing a Road Curve With Large Size Stone.—In a recent discussion of a paper before the Western Society of Engineers Mr. W. H. Dean gave the following description of a method used by the Board of Local Improvements of Chicago in repairing a worn macadam surface. The work was done on Evanston Ave., at Devon Ave., Chicago, about a quarter of a mile west from the lake. The street has a limestone macadam surface. Automobiles come down from the north, from Evanston, at a high rate of speed, and at Devon Ave. turn a sharp corner. There are street car tracks on a curve on the southwest side of the street, leaving only a narrow roadway in which to turn, and the road is subject to hard usage. The limestone macadam surface was worn through very considerably about the curve, into a deep hole, and a great amount of dust was raised. To repair this, a large size of crushed granite, 3 or 4-in. size, was put in, bonded with gravel and loam. It was put in at a difficult time of year in this respect, in that it was freezing weather. It has been down about two years and has worn splendidly. There is scarcely any dust there and almost no sign of wear. It is a little bit rough, but otherwise it has made a splendid corner. On the rest of the road, except where it has been resurfaced, the limestone has been worn very considerably.

Road Work in Connecticut in 1909.—During 1909 a total of 82.9 miles of gravel and macadam state roads were completed. Of this total 29.19 miles were gravel roads, the average width paved being 14 to 16 ft. and the average thickness of the completed pavement being 8 in. The average cost per mile for the gravel roads was $5,591.42. A total of 53.71 miles of macadam and telford macadam roads, 14 to 16 ft. average width, were completed in 1909. The average thickness of the completed pavement was 7 in. and the average cost per mile was $9,625.44. In addition there was 16.31 miles of grading completed in 1909. The average width was 14 to 16 ft., and there was 6 in. hardening, the average cost per mile being $5,681.28. Mr. James H. MacDonald is State Highway Commissioner. The above costs include all grading, culvert and bridge work, etc. The state road work unfinished and under contract at the beginning of the year was as follows:

	Miles.	Cost.
Macadam	62.55	$594,448
Gravel	32.16	238,395
Grading	20.04	110,675

The work projected for this year is as follows:

	Miles.	Estimated cost.
Gravel	50	$275,000
Macadam and telford macadam	100	950,000
Grading	50	275,000

Comparative Bidding Prices on Plain and Bituminous Macadam.—The following comparative bidding prices on plain and bituminous macadam are taken from the recently issued report of the Commissioner of Public Roads of New Jersey:

Road.	Depth macadam, ins.	Ordinary macadam. Per sq. yd.	Bituminous macadam. Per sq. yd.
			Mixing method.
Walnut Ave., Union Co.	8	$0.75	$1.10
Gladstone, Morris Co.	.	.62	.95
Brownes Corner, Camden Co.	.	.90	1.17
			Penetration method.
Beattystown, Warren Co.	.	.56	$0.62
Plainsboro, Middlesex Co.	6	.73	.90
Jamesburg, Middlesex Co.	8	.73	.85

It will be noted that the average additional cost of this type of construction is 31⅓ cts. per square yard, or $2,570 per mile, for a 14-ft. road when the material is mechanically mixed before application to the road, and 12½ cts. per square yard, or $1,000 per mile, for a 14-ft. road when the bituminous material is applied by the pentration method. It is estimated that these roads will cost little or nothing for repair and maintenance during their first two years, and after that period the cost of maintenance will not exceed $250 per mile, while the average yearly cost for the proper maintenance of a macadam road is $400 per mile.

Berm Ditches for Surface Drainage.—In many places along a road berm ditches are of very great assistance in maintaining the highway. This is an open ditch, usually at the top of the bank, alongside the road, the object being to intercept surface water coming from territory beyond the ditch, and preventing it from soaking into or washing down the face of the bank. The sliding of banks, especially those of a clayey nature, is a frequent source of trouble, and in many instances a very expensive one. This sliding is in nearly all cases caused by the material of which the bank is composed becoming saturated with water from the lands lying back of it, and by cutting off this surface water by means of a berm ditch before it reaches the bank, troubles of this kind are in many instances entirely obviated. Instances are rare where it will be found necessary to dig a berm ditch deeper than 3 ft., and in very many cases 2 ft. is sufficient. When the underlying soil is hard-pan, hard clay, or any other impervious material, the ditch must be cut down to, and a little way into, the hard material in order to effectually prevent water passing to the face of the bank. The above note has been taken from a recently issued bulletin of the Bureau of Town Highways of the New York State Department of Highways.

Laying Macadam on a Soft Foundation.—In the construction of a macadam road on clay subsoil small material is sometimes placed at the bottom. This was done in the case of macadam road built in Chicago; the method employed was described by Mr. A. C. Schroder in a recent discussion of a paper before the Western Society of Engineers. The foundation of the street to be improved being entirely of clay, a portion of the roadway was covered with stone, ranging in size from 2 to 2½-in. in the largest dimension—the intention being to finish the macadam roadway in the manner customarily followed in Chicago. The frequent rainfalls during the progress of the work caused the clay foundation to become quite soft, so that the rolling of the surface with the steam roller proved entirely unsatisfactory, as it simply churned up the materials to such an extent that the roadway could not be brought to a surface sufficiently unyielding to receive the finishing material of granite macadam. To obviate the difficulty and to allow the work to be completed without delay, the experiment was made of using a layer of cinders 4 to 6 ins. in depth, spread over the clay, and forming a subgrade. Upon this the crushed stone was spread and rolled in the usual manner, and it was possible to finish the work satisfactorily and without delay. The cinders apparently acted as a mattress, directly overlaying the clay and preventing the churning up of the clay and stones. In the same discussion Mr. L. W. Page described an experience of the Massachusetts Highway Commission with quicksand. About 14 or 15 years ago, when the commission was building a road on the Island of Martha's Vineyard, they struck quicksand, and dumped load after load of rock into it which disappeared. Finally, one of the commissioners suggested that unbleached cotton be spread over the quicksand and the stone put on top of it. Accordingly several bolts of unbleached cotton were spread over the quicksand, and the division lines covered with another layer, after which a load of stone was dumped on it. It settled down about 0.75 to 1 in. and stopped. More stone was dumped and it was rolled by a steam roller. The road has been in use for 15 years and no settlement has occurred.

Sand-Clay Road Construction in Kansas and Some Data on Its Cost.*

In the construction of a sand-clay road it is a difficult problem to select a proper clay for the binding material; laboratory tests will assist in determining what to expect from different clays, but it is much better to check your laboratory test by building only a few miles of road at a time until you have a chance to see the practical test demonstrate the worth of the clay. The properties of clay, which are of the greatest importance in road construction, are plasticity and the property of slaking when they first become wet after having been uncovered. The most plastic of these materials are technically called "ball clays." A lump of such clay immersed in water will usually preserve its form a long time.

*Abstract of a paper by W. S. Gearhart, State Highway Engineer of Kansas, read at the 1910 meeting of the Missouri Highway Engineers' Association.

Non-slaking clays, although they are very sticky when wet, generally readily mix with water. There are other clays, however, which will immediately fall to pieces when immersed as a lump of quicklime will do. This is due to the rapid absorption of water in the porous structure of the clay. These are known as slaking clay and are more easily mixed with other materials than the more plastic ball clays and this is of course to their advantage for road building but, on the other hand, they often have inferior binding powers.

There is still another physical characteristic of clay of great importance in the construction of roads. Many clays shrink when dry. This shrinkage is the measure of their expansion and expansion renders the sand-clay mixture unstable. When water removed by evaporation is restored to the sand-clay mixture, its entrance is accompanied by a simultaneous expansion which separates the grains of sand. This property is inherent in the clay and cannot be overcome, but by using less clay its destructive action can be modified in a measure. The best kind of clay for this construction is one which slakes sufficiently easily to enable the lumps to be readily broken up and which, at the same time without being too plastic, has sufficient binding power to cement the grains of sand and form a smooth impervious road surface.

The available materials should also be tested in order to secure a clay having the least possible shrinkage. The best method is to examine the roads in which this material is found. The best wearing surface of the sand-clay road is obtained when the voids in the sand are entirely filled with a good binding clay. Any excess of clay above the amount required to fill the voids in the sand is a detriment.

In constructing a sand-clay road on a sandy subsoil, adequate permanent drainage should be provided and the road well crowned. Shoulders should be thrown up to confine the clay as it is deposited. The work should begin at the end of the road nearest the supply of clay and the clay deposited in layers from 6 to 12 ins. deep and from 10 to 18 ft. wide, depending upon the volume and kind of traffic to be carried. The large lumps should be broken up while dry and the whole surface smoothed up and 2 to 4 ins. of sand placed on top. The sand and the clay should then be thoroughly mixed and puddled with water by plowing and harrowing with a disk harrow. If the water is not available it is well to wait until after a prolonged rain to do the mixing and puddling. Dry mixing has generally been unsuccessful.

If sufficient funds are not available to do the mixing and puddling by machinery it may be left for the traffic to do it. If this method is followed a muddy road will result for some time, however, and it will require probably two years to get the road in good condition. When the clay balls, add more sand and if the surface loosens during the dry weather add more clay, or better use a clay with good binding power.

A first-class sand-clay road on a clay subsoil can be constructed in the following manner: After the road has been graded and properly crowned and ample drainage provided, 4 ins. of the surface for the width to be treated should be pulverized by plowing and disking and then a layer of sand 6 to 8 ins. deep placed upon it and the sand and clay thoroughly mixed comparatively dry by plowing and harrowing. After a prolonged rain puddle the road with a harrow and shape it up well while wet, stop the traffic if necessary until the surface has become dry, but the road should be thrown open to use as soon as practicable. No sand-clay road is in proper condition when first constructed and it will require careful attention for two years. It should be dragged after every rain.

The sand-clay road is more resilient than an ordinary macadam road and generally costs less to construct and maintain than any other except an earth road.

So far as I have been able to learn, the first sand-gypsum road in Kansas was constructed in 1892 near Kinsley in Edwards County by John DeMain. In this county gypsum is found in large quantities in the flats and sand hill beds. Its composition is about 1 part of gypsum to from 3 to 5 parts sand. In appearance it resembles a sand lime mortar of the same proportions. In some of the beds large deposits of gravel are found with the gypsum which add very much to its road making value.

In 1892 five miles of sand-clay road were constructed; in 1898, five miles; in 1902, five miles, and since that time ten miles more have been completed, making a total of 25 miles. These roads were all built 16 ft. wide. The gypsum was placed 8 ins. deep in the middle and about 6 ins. at the sides. The average haul of the gypsum was ½ mile. Three dollars per eight-hour day was paid for teams. The traffic was left to do the mixing and the cost has been $350 per mile, or 3.72 cts. per square yard, and the cost of maintenance with a King drag is $10 per mile per year. For the original construction there was no doubt a large amount of labor donated which is not reported. Before the roads were treated 50 bus. of wheat was the maximum load for four horses. Now 100 bus. can be hauled with ease. I was recently over these roads in an automobile and in a good many places the cyclometer registered 40 miles per hour.

In 1905 and 1906 4½ miles of sand-gypsum road was constructed south of Syracuse in Hamilton County. This road is 16 ft. wide and the gypsum was placed 8 ins. deep. Three dollars and fifty cents per day was paid for teams and the average haul was three miles. The traffic did the mixing of the sand and gypsum and the cost was $500 per mile, or 5.3 cts. per square yard, and the cost of maintenance with the King drag is $5.50 per mile per year. On account of the long haul and the low cost, I believe there must have been considerable labor donated, but none is reported. In dry weather the surface grinds up some and blows away. From my observations of the sand-gypsum roads I believe that this trouble can be overcome by treating the surface with a good grade of road oil.

Immediately after a rain the road is a little slippery and this can practically be eliminated by placing a little sand on the surface. A 1,000 lb. was a big load over this sand road before it was improved, but now 3,000 lbs. is a very ordinary load.

During the summer of 1906 Prof. Albert Dickens, of the Kansas State Agricultural College, oiled one mile of very bad sand road in Finney County, south of Garden City. The amount of oil required varied from 3.7 to 6.06 gals. per square yard. This road has proven very satisfactory, even though it has been sadly neglected.

In 1909 five miles of sand-gypsum road was constructed two miles on the north end and three miles on the south end of the oiled road. On the north end a very heavy clay was used which contained about 20 per cent of gypsum and 15 per cent of gravel, and it has made a very fine road. The south end of the road was constructed with what is called gypsum, but it is really a silt very much like the Arkansas river sediment. It lacks binder and is mushy when wet and blows away when dry.

TABLE I IS A SUMMARY OF THE COST OF THE ROAD FOR THE DIFFERENT MILES.

TABLE I.

	Width, feet	Depth of gypsum, inches	Average haul, miles	Cost per sq. yd., cents.	Cost per mile
1st mile	12	8	1¼	7.92	$ 510
2nd mile	8	10	1¼	18.72	880
3rd mile oiled	18			11-19	*1,480
4th mile	8	10	2½	37.45	1,760
5th mile	8	10		18.72	880
6th mile	8	10		15.00	704

*Average.

The road was left for the traffic to mix the materials and $50 per mile has been spent in dragging, shaping up and repairing the weak spots. The road is dragged after every rain and high wind. A 6,000 lb. load on a wagon with 2-in. tires is often seen on this road. It used to be a three-hours drive over these six miles with two horses in a buggy.

At Ashland in Clark County along the Cimarron River there was four miles of sand road which was one of the worst stretches of road in the state. This sand was so fine and there was so much of it that in a dry time it was a heavy drag for a team with an empty wagon and to get through it at all with a load necessitated not less than four hours, and the journey had to be made by very slow stages and the horses rested every few hundred yards. A toll road company was incorporated a number of years ago with a capital of $5,000 to construct a sand-clay road through these sand hills. A good quality of clay was found at distances ranging from a 100 yds. to a mile from the work. The road was well crowned and from 8 to 10 ins. of clay placed upon it and well dragged down. The weather was very dry during the construction and for some time trouble was experienced with chuck holes cutting through the clay, but after the first good rain no further trouble was experienced.

The road is maintained by collecting tolls of 5 cts. per mile for automobiles, 2¾ cts. per mile for wagons, 2 cts. per mile for light vehicles and 2 cts. per mile for cattle per head. A man and team is constantly employed to drag and refill the worn places and collect the tolls. After every rain the road is dragged with a King drag one or more times, which keeps the surface smooth and the road well crowned.

The work of preparing the road bed, hauling and distributing the clay and putting the road in good condition costs from $800 to $1,000 per mile. A great deal more than this per mile has been spent for bridges, toll house, tools and other accessories, but the traffic is heavy and the tolls collected not only pay the expenses of upkeep and maintenance, but will ultimately reimburse the company for the outlay in first cost.

Tests of Hollow Concrete Blocks.—The Maryland Geological Survey has conducted a series of tests for the National Hydraulic Stone Co., of Baltimore, on hollow concrete blocks made in proportions of 1 part cement to 8 parts of aggregate, the latter consisting of unscreened sand and crushed stone. The blocks were made in the factory of the above company on a Fisher hydraulic stone press, manufactured by the Fisher Hydraulic Stone & Machinery Co. This press rams the blocks under a pressure of 200 tons. The tests were made in one of the laboratories of Johns Hopkins University and in general followed the tests prescribed in the standard regulations for hollow concrete blocks of the National Association of Cement Users.

Absorption tests were made on two samples of faced and two of rough blocks. These were immersed, face down, in ½ in. of water, and weighed after being immersed 30 minutes, 4 hours and 48 hours. The absorption is expressed as per cent of weight of water to the weight of the dry block. The specimens each weighed about 3,000 grams when dry. The absorption was as follows:

Immersion	30 min.	4 hours.	48 hours
1. Faced block	1.3	2.6	3.9
2. Faced block	2.4	3.3	4.2
3. Rough block	0.3	1.1	1.8
4. Rough block	0.3	0.9	1.4

Transverse tests were likewise made upon four specimens. The dimensions of the specimens, the maximum load carried, and the

TRANSVERSE TESTS.

Specimen	b	d	l	W	R
1	9	3	6	4,780	531
2	9	3	6	6,041	671
3.	9	3⅛	6	7,440	762
4.	9¼	3¼	6	5,650	917

modulus of rupture are given in the accompanying table. The modulus of rupture was figured from the formula $R = 3Wl \div 2bd^2$, in which l is the distance between supporting knife edges in inches, W the maximum load in pounds, b the width, d the depth, and R the modulus of rupture. All dimensions are given in inches.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Day Labor Vs. Contract Work on the Los Angeles Aqueduct.*

Editor *Pacific Outlook*.

Dear Sir:—In your issue of December 11, 1909, you publish a copy of an article which appeared in ENGINEERING-CONTRACTING reviewing a report by Metcalf and Eddy, consulting engineers of Boston—this report having been made to the Boston Finance Commission on the relative economy of doing public work by contract or by municipal day labor, called "force account." The finding is that force account work is the more expensive method in certain New England cities.

The entire tenor of the article is to the effect that all public work should be done by contract. The report by Metcalf and Eddy has been extensively reviewed by engineering publications. The firm of Metcalf and Eddy are engineers in good standing, but it should be remembered that ENGINEERING-CONTRACTING is a paper that is devoted to the interests of the contractors of the United States.

Much municipal work has been done in the past without adequate supervision and economic management, men of low efficiency often gradually accumulating in a permanent organization. When public work is performed politically, there is no limit to the extravagant costs that may result, just as there would be under contract work resulting from collusion, and a discussion thereof is superfluous. The question, therefore, resolves itself into one of whether municipal work can be organized on business principles. There is no reason why a municipality with large financial resources, capable of buying adequate equipment and paying reasonable salaries, should not obtain as high grade machinery and superintendents as any contractor. Manufacturers take pride in selling their equipment to a municipality or to the federal government, and advertise such sales extensively. Most young men, and particularly ambitious young engineers seeking experience and reputation, desire connection with large public organizations in an official capacity, provided the job is clean, and they are usually willing to work at less wages than they would for an individual.

Let no one think that the engineering direction of public work under contract is a flowery bed of ease. It requires as much detailed supervision and vigilance as if the work were carried on by an organization reporting directly to the engineer. Often when contractors encounter great difficulties and unexpected expenses, the municipality and the engineer are left to finish the work. This was illustrated in the case of the Outfall Sewer in Los Angeles and at the Laguna Dam which was started for the Reclamation Service by one of the largest contracting firms in the United States. Conversely, if the work proves unexpectedly easy, the municipality would not share in the resulting good fortune. It is often a case of "heads I win and tails you lose."

There is more temptation for a contractor, no matter how honorable he may be, to skimp his work for which he is paid a fixed sum, than for a municipality to slight its own work under the force account system. Pieces of work on which the costs are very uncertain, such as tunnel driving and foundation work, are those best suited to the force account system, because a good contractor must assume all unfavorable conditions as occurring, and bid accordingly.

When public work is let by contract, it must be as the result of advertising and the law usually compels the award to the lowest bidder or to the lowest responsible bidder. In our own street work, it must be the lowest bidder or all bids must be rejected. The lowest bidder may be a bidder with bad judgment as to probable costs, and while his bid may be protected by bond, the bond is of little practical value. I have never known of collection on a contractor's bond.

The greatest advantage that the contractor enjoys is that he can purchase materials and employ men quickly, whereas municipal officers are seriously incumbered with formalities, designed to prevent fraud, but which are an expensive handicap to an honest administration.

The Los Angeles Aqueduct is in charge of a non-partisan and most efficient board of public works. About 95 per cent of the work is being done by force account. There is not a political appointee in the entire organization. The engineers are energetic young men, ambitious to make reputations and are promoted on merit. The bonus system is applied where possible, and the results so far obtained have been most satisfactory.

The Jawbone Division is 22 miles in length and is the heaviest on te Aqueduct. Consequently, it was one of the first to be opened for construction. In order to determine whether this work should be done by contract or by force account, bids were called for; these were compared with the engineers' estimates and finally all bids were rejected and the engineering department ordered to construct the work by force account. Mr. A. C. Hansen was placed in charge as division engineer.

The Jawbone Division is now 80 per cent completed. It is possible, therefore, to make a comparison between the cost of the work done by the municipality and the prices bid by the contractors. It will be appreciated, however, by any person who has had experience in construction work that the unknown elements of the cost for "extra work" done by the contractor are most important ones, which do not appear in a bid but which are covered by the force account cost figures which are here presented.

These "cost figures" are reliable; each piece of work is made the subject of detailed study. All charges for general expense, equipment, housing, sanitation, administration, etc., are included. The analysis was made by Mr. O. E. Clemens, in charge of the cost-keeping department of the Aqueduct.

Of the 217 miles of Aqueduct, including three hydro-electric plants and one cement plant, all work is being done by force account with the exception of 11 miles of valley work.

One feature of this work which has been effective in securing good results is the issuing of monthly cost and progress bulletins covering every structure. These show unit costs of similar work at different places, giving credit to those in immediate charge and advertising their results, whether good or bad, throughout the entire organization each month.

COST ANALYSIS.

Five bids were received July 27, 1908, for the construction of the Jawbone Division, as provided in Specification No. 33. These bids, with the exception of the lowest, were submitted by large and experienced contracting firms from various parts of the United States. The unit prices of the low bidder are shown under the tables of costs.

As stated elsewhere, the estimated quantities shown on the original specifications have been somewhat modified to meet conditions developed during construction, the tunnel footage having been materially increased and conduit footage decreased. The comparisons of costs have been based on the quantities as now established. The estimated cost of engineering, in case the work has been let by contract, has been added to the contractor's bid. This expense under the force account system has also been included in the costs shown.

The following plant, according to Specification No. 33, was to be installed or built by the city for the free use of the contractor. The cost of this has been eliminated from this analysis:

Compressor plants.
Main water pipe lines.
Roads and trails.
Power lines and transformer stations.
Main telephone lines.

The charges for electric energy which would have been made to the contractor have been included in force account costs. The comparison of costs is made on tunnel and conduit work, the cost of culverts being disregarded, as they represent a very small percentage, and have averaged less than the bid.

Total Quantities in Lin. Ft.:

	Tunnel.	Conduit.	Total.
Section 1	19,636	23,809	43,445
Section 2	21,332	5,326	26,658
Section 3	22,830	10,088	32,918
Total	63,798	39,223	103,021

Contractor's Bid.

Completed and Lined Tunnels.

	Feet.	Rate per ft.	Total.
Section 1	19,636	$22.50	$ 441,800.00
Section 2	21,332	36.70	782,884.40
Section 3	22,830	33.30	760,239.00
Total	63,798	Av. $31.11	$1,984,923.40

Conduit Excavation:

	Ft.	Av. yardage.	Price cu. yd.	Total.
Section 1	23,809	5.9	$1.066	$149,744.32
Section 2	5,326	5.2	1.625	45,004.70
Section 3	10,088	5.0	1.175	59,267.00
Total	39,223	Av.	$6.48	$254,016.02

Conduit Lining and Cover:

	Feet.	Rate per lin. ft.	Total.
Section 1	23,809	$6.721	$160,020.29
Section 2	5,326	7.00	37,282.00
Section 3	10,088	6.876	69,363.09
Total	39,223	Av. $6.80	$266,665.38

Under the specifications, cement, tunnel timbers and reinforcing steel were to be furnished to the contractor free, at the nearest railroad station. This represents a cost to the city as follows:

Cement, per lin. ft. of tunnel and conduit	$2.70
Tunnel timbers, per lin. ft. of tunnel	.62
Steel, per lin. ft. of conduit	.27

In case the work had been let by contract, it would have been necessary to maintain an engineering staff with clerks and inspectors, at the expense of the city, for the period of 2½ years involved in the contract. This cost would have been $3,715 per month, equal to a total of $111,450, or an average cost per foot of aqueduct of $1.08. The total cost of engineering and supervision, under the force account system adopted, is included in the unit costs given.

ESTIMATED COST OF WORK TO CITY OF LOS ANGELES, IF DONE BY CONTRACT.

Tunnels:	
Bid per foot completed	$31.11
Timbers per foot	.62
Cement per foot	2.70
Engineering and inspection	1.08
Total per foot	$35.51
Conduit:	
Bid—Excavation per foot	$ 6.48
Lining per foot	6.80
Cement per foot	2.70
Steel per foot	.27
Engineering and inspection	1.08
Total per foot	$17.33

Above costs do not allow anything for depreciation on instruments and equipment used by the city on this work.

ACTUAL COST BY FORCE ACCOUNT.

The total amount of work to be done, and footage completed to Jan. 1, 1910, is as follows:

	Total footage.	Amount done.	Pct. done.
Tunnel excavation	63,798	61,515	96½
Tunnel lining	63,798	33,805	53
Conduit excavation	39,223	33,868	86
Conduit lining	39,223	16,100	41

Detail of Tunnels:

Class of Work:	Total expended.	Amount built. Ft.	Unit cost.
Excav. and timbering	$780,360.00	61,515	$12.76
Lining	229,727.00	33,805	6.80
Total per foot of completed tunnel			$19.50

*Reprinted from a communication from J. B. Lippincott, Assistant Chief Engineer Los Angeles Aqueduct, to the "Pacific Outlook" of April 2, 1910.

Detail of Conduit:

Class of Work:	Total expended.	Amount built. Ft.	Unit cost.
Excavation	$121,521.50	33,868	$ 3.60
Lining	117,561.50	16,100	7.30

Total per foot of completed conduit.....$10.90

Equipment, Pipe Lines, Etc., for the Entire Footage:

Miscellaneous equipment, exclusive of compressor plants, main pipe lines, main telephone lines and roads	$150,000.00
Branch pipe lines total cost	20,000.00
Local telephone system, total cost	4,000.00
Buildings, including wiring for lights	53,000.00
Total	$227,000.00

Assuming no salvage on this plant, we have $227,000 divided by 103,021 equals $2.20, average cost per foot for entire division.

MAINTENANCE AND OPERATION TO JAN. 1.

The general maintenance and operation charges on water supply, roads, telephones and division administration amounts to 3½ per cent of total construction charges, or 68 cts. per ft. for tunnels and 38 cts. per ft. for conduit. The charges for the field engineering and supervision are included in the construction costs given.

TOTAL COSTS BY FORCE ACCOUNT.

Tunnels:	
Excavation	$12.70
Lining	6.80
Maintenance and operation	.68
Equipment	2.20
Total	$22.38
Conduit:	
Excavation	$ 3.60
Lining	7.30
Maintenance and operation	.38
Equipment	2.20
Total	$13.48

COMPARISON.

Tunnels:	
Cost by contract	$35.51
City costs	22.38
Saving per foot	$13.13
Conduit:	
Cost by contract	$17.33
Saving per foot	$ 3.85
City costs	13.48
63,798 feet x $13.13	$837,667.00
39,223 feet x 3 85	151,008.00
Estimated total saving on Jawbone Division	$988,675.00

This estimated saving is conservative, as the work to be completed will cost less per unit than that done previously, owing to the nature of the ground and the improvement in the organization. Salvage values of plant, also extra work which we have done and charged to construction (which would have been billed as "extra work" by any contractor) would have a tendency to increase this estimate.

One of the most advantageous features of force account work is the opportunity that it affords to make changes in the location of the line or in the design of the various structures, things which are very difficult to do when a municipality is bound by rigid contract. The economic studies that are made as the work progresses constantly offer suggestions for a change in route or changes in the detail location. The character of the materials which are encountered frequently demands a complete change in the design of a structure to be built. It is thus possible, under force account with good cost-keeping, to obtain the most economical results and the most stable work.

This change in construction is vividly illustrated by the fact that the first location of our line called for 28 miles of tunnels, whereas the line as it is now being built will contain 43 miles of tunnels.

Very truly yours,

J. B. Lippincott.

Method of Lining An Irrigation Canal With Cement Plaster, With a Discussion on Cement Plaster Versus Lime and Cement Plaster.

BY W. D'FOHAN.*

The Intake of Community Ditch, a canal of 650 sec. ft. capacity, is situated at Eldorado Springs, a favorite summer resort 29 miles from Denver, Colo. The ditch, some 45 miles long, is part of the Standley Lake System. It irrigates the lands lying directly north of Denver, and also acts as a feeder for Marshall, West and McKay Lakes, and other reservoirs of the Standley project.

From the headgates to the tunnel, a distance of 2,640 ft., and directly above the summer residences of Eldorado Springs, the ditch was lined with masonry, 6 ft. bottom, with sides sloping on an average of ½ to 1, to a height of 9 ft. The masonry work which was completed in March, 1909, was so carelessly done and without proper supervision that in September the ditch was practically useless. An examination of the work showed that the foundations for the masonry had not been prepared in any way whatsoever, the wall for the most part being laid on filled dirt without tamping. A 4-in. tile drain supposed to carry off all the seepage water from the various springs with which the ground abounds was laid as a switch back, while the masonry proper was pointed with mortar—in spots.

The results were, the wall settled, showing unsightly cracks, the seepage and spring water found its own way out underneath the floor which broke down, and the escaping water took the greater part of the pointing from between the stones. A spasmodic attempt was made to repair the worst places by using a lining of reinforced concrete 3 ins. thick, but as the shale excavated from the tunnel was used and it disintegrated on the application of water, the cure was as bad as the disease.

The reconstruction was begun in the latter part of September, 1909. Mr. J. G. Wood, Assistant Chief Hydraulic Engineer in charge, with Mr. W. D'Rohan, Superintendent of Construction. For the repairs, four plans were suggested and discussed: (1) A 3-in. reinforced concrete lining; (2) cleaning and repointing masonry; (3) plastering with lath reinforcement, and (4) plastering with cement plaster.

Owing to the very poor foundation it was deemed inadvisable to put any additional weight on it, thus disposing of the reinforced concrete lining. The masonry work was in such bad shape that repointing was out of the question, and finally since the plaster was to be subject only to slight compression, it was decided to use plain cement plaster.

The announcement of this decision was the cause of a lively discussion among the members of the engineering staff of the Denver Reservoir Irrigation Company, and many outside engineers were drawn into the argument. The main bone of contention was the advisability of substituting lime for part of the cement, but in the end the cement advocates prevailed, and cement plaster without the addition of lime was used.

The supporters of the lime theory advanced the argument that lime added to the plaster made a denser mixture, practically waterproof, was easier worked, more uniform in color and possessed greater adhesive strength and was much cheaper. In addition to the acknowledged universal practice, extensive quotations were made from reports of recent constructions where lime was added not alone to plaster but to concrete, with an idea of increasing the ultimate strength and making it waterproof. Among other authorities quoted was H. A. Reid, "Concrete and Reinforced Concrete Construction," p. 857. Dealing with concrete blocks, the author says:

Lime.—Lime is sometimes used to replace a portion of the cement. The most convenient form of lime for use in block-making is the dry-slaked or hydrate lime, now a common commercial article. No great saving results from its use, but its addition in the proportion of from one-quarter to one-half the cement used will cause the blocks to set more rapidly, make them lighter in color, and make the concrete denser and more impervious to moisture. In sand mixtures with the proportion of 1 to 4 or 1 to 5, at least one-third of the cement may be replaced with slaked lime without loss of strength.

The argument against the use of lime was substantially as follows: There are no hydraulic limes manufactured in the United States (Reid, pp. 7 and 8), while the commercial lime of the United States is "quicklime," which is chiefly calcium oxide (CaO), about which Trautwine says (p. 925, 1908):

General Remarks on Mortar and Lime.—On too great a proportion of public works, the common lime mortar may be seen to be rotten and useless, where it has been exposed to moisture; which will be carried by the capillary action of earth to several feet above the natural surface; or as far below the artificial surface of embankments deposited behind abutments, retaining-walls, etc. The same will frequently be seen in the soffits of arches under embankments. Common lime mortar, thus exposed to constant moisture, will never harden properly. Even when very old and hard, it absorbs water freely. Cement also does so, but hardens.

Most writers on cement testing, after relating numerous troubles from free lime in cement in the way of dangerous cracks, advise as follows:

Novices should make at least a score of boiling tests before they should consider themselves competent to pass upon a sample of cement. It is also recommended that they secure some quick lime, powder it very finely and mix it in varying proportions with a sample of cement of tested high grade. These mixtures will develop some of the troubles described above and will give the beginner experience in recognizing cement of actual poor quality.—Dragon Cement, p. 73.

In composition, hydraulic lime is practically the same as cement, and the best known American hydraulic lime is "Rosendale Hydraulic Cement."

Against the assertion that the addition of lime made a denser mixture, the specific gravity of hydraulic lime lies between 2.5 and 2.8, while that of Portland cement varies from 3.00 to 3.25 (Candlot's, "Ciments et Chaux Hydrauliques," p. 26, 1898), and since both are pulverized to the same degree of fineness, it is clear that any additional density can be more easily obtained by the addition of more cement than lime; while for waterproofing it is generally admitted that a rich and wet mixture properly proportioned gives a water-tight result.

A reinforced concrete water tank, 10 ft. inside diameter and 43 ft. high, designed and constructed by W. B. Fuller at Little Falls, N. J., has some remarkable features. It is 15 in. thick at the bottom and 10 in. thick at the top. The tank was built in 8 hours, and it is a perfect monolith, all concrete being dropped from the top, or 43 ft. at the beginning of the work. The concrete was mixed very wet, the mixture being 1 part cement, 3 parts sand, and 7 parts broken stone. No plastering or waterproofing of any kind was used, but the tank was found to be absolutely water-tight, although the mixture used has not generally been found or considered water-tight.—Gibson & Webb, p. 41.

The assertion of greater adhesive strength is thoroughly upset by the following table taken from Hodgson, "Cement Plaster":

ADHESIVE STRENGTHS OF LIME AND CEMENTS.

		Lbs. per sq. in.
Fat lime and sand	1 to 3	4¼
Common lias lime and sand	1 to 3	9
Common lias lime and sand	1 to 4	6¾
Portland cement and sand	1 to 4	23
Portland cement and sand	1 to 6	15½

This table shows the force required to tear apart bricks bedded in mortar made with the usual proportions of sand at the end of 28 days. The following table by Redgrave needs no comment:

COMPARATIVE STRENGTH OF GREY LIME AND PORTLAND CEMENT MORTAR, ALSO PORTLAND CEMENT MORTAR WITH THE ADDITION OF LIME AND MORTAR.

		Proportions.					
No.	No. of tests.	Sand.	Cement.	Lime.	Water.	Breaking strain on 2.25 sq. in. in lbs.	Breaking weight per sq. in. in lbs.
1	17	2.00	...	1.00	1.33	61.06	27.13
2	27	2.00	...	1.00	1.33	106.07	47.09
3	27	2.00	...	1.00	1.33	82.00	36.44
1	15	6.00	1.00	...	1.25	233.53	103.79

*634 22d St., Denver, Colo.

2	20	8.00	1.00	...	1.66	154.80	68.80
3	35	10.00	1.00	...	2.00	112.88	50.16

2	74	8.00	1.00	0.66	2.00	132.62	58.94
3	85	10.00	1.00	0.83	2.50	95.27	42.34
			Loam				
1	21	6.00	1.00	0.50	1.00	136.80	60.80
2	25	8.00	1.00	0.66	1.33	86.48	38.43
3	19	10.00	1.00	0.83	2.00	64.50	28.66

The question of cheapness is easily disposed of by consulting the market quotations. ENGINEERING-CONTRACTING of April 6, 1910, quotes cement f. o. b. Chicago, $1.05 per bbl. and lime in job lots under 500 bbls. f. o. b. New York, $1.00 to $1.85 per bbl.

A most interesting article in ENGINEERING-CONTRACTING Dec. 30, 1908, on Methods and Cost of Lining Ditches and Canals, after mentioning several instances of successful lining with cement plaster from ¼ in. to 1 in. in thickness, in California, makes special mention of the Gage Canal, which was lined with cement mortar, 1 to 4, ¾ in. thick at a cost of 3¾ to 4 cts. per sq. ft.

Mr. Irving, former Engineer of the Gage Canal Co., states in his report that after a test of ten years the lining more than justified their expectations. The cost of repairs after four years' use was very small, less than ½ of 1 per cent of the capital cost in four years.

The conditions for lining Community Ditch were more than favorable. Good sharp, clean sand was found just across the creek, and was brought into the ditch in ½ cu. yd. cars, at a cost of 25 cts. per cu. yd., and was used without screening. Cement which cost $1.36 per bbl. was brought by rail to within 500 yds. of the ditch, and the piped water supply for the cottages of Eldorado Springs lay along the ditch and needed only a few connections to attach a hose. The tracks and cars had not been moved, and were replaced in the ditch at a cost of $100, or less than 2 cts. per sq. yd. of plaster. The mortar was mixed in a ¼ cu. yd. Ransome mixer with gasoline power, gasoline costing 40 cts. per day, and a first-class mix was obtained. The engineer of the mixer, who was also timekeeper, received $3 per day.

The joints were first picked out, then the wall was thoroughly washed with the hose, when the joints were repointed with 1 to 3 mortar thoroughly rammed with chisel shaped sticks. The first coat of ¾-in. mortar, 1 to 3, was applied, care being taken to have the wall well wetted; this was put on with plasterers' and masons' trowels, then floated with wooden floats to insure absolute contact and drive out all air. After the first coat had its initial set, which varied from 4 to 6 hours, the second and final coat was applied and floated in the same manner, whatever rubbed off being gathered up and mixed with the next batch. The plaster was kept wet for two or three days afterwards.

Owing to the great difficulty in obtaining cement, 1909 being a banner year for the local cement factories, this work, which took little over four weeks' actual labor, was delayed until frost and snow intervened. The temperature varied from zero to 40° F. and the only protection used was a thick wash of cement and sand, 1 to 3, applied with a brush, about ⅛ in. thick. This peeled off in 8 or 10 days, leaving the plaster in first class shape.

Owing to the severe snow storms, work was abandoned in December, with the sides finished, and a ½-in. concrete coping intended to prevent any moisture getting in back of the plaster coat was but partially completed. The holes in the bottom were patched with 1:2:4 concrete, with the intention of renewing repairs after the irrigation season of 1910.

During the enforced stoppages in plastering, the laborers were employed in putting in stone drains to carry the seepage under and into the ditch.

Italian unskilled labor was used entirely. The men had no previous experience, and were encouraged by an offer of 25 cts. extra per day for the best workers, with the result that the plastering cost a total of 50 cts. per sq. yd. for everything. Of this, 4 cts. per sq. yd. mixed and conveyed to the plasterers, washing walls 1 ct. and track 2 cts.

An inspection on May, 1910, showed the ditch in splendid condition after five months' hard wear. The plaster shows no signs of pulling away and is especially strong where used on 900 ft. of concreting. Five contraction cracks have appeared at points of tangent and these have silted up. No expansion joints were used, as there were none in the masonry.

The conclusions to be drawn from the writer's experience on this and similar works, the very useful articles along similar lines in ENGINEERING-CONTRACTING, Dec. 2 and 30, 1908, and the discussion previously mentioned are:

(1) The addition of lime,—hydraulic, hydrated or otherwise—to cement plaster or concrete is neither economical nor beneficial.

(2) Cement plaster is the cheapest and most satisfactory method of lining and water proofing earthwork or masonry ditches.

(3) Cement plaster can be made permanent on masonry or concrete no matter how old by (1) thoroughly washing the surface to remove all dust and dirt; (2) having surface well soaked; (3) thoroughly floating to get plaster as dense as possible and insure good contact by expelling all air.

(4) With skilled superintendence common labor gives good results.

(5) No need for acid washes to insure a good bond.

(6) A thick coat of grout wash is sufficient protection for concrete and plaster against a fairly heavy frost.

Method and Cost of Constructing Two 18-in. Cast Iron Water Mains by Day Labor for the Fort William, Ontario, Water Supply.*

Supply Main to Reservoir.—The line, which was 10,200 ft. in length, was located to avoid solid rock as far as possible; 8,400 ft. was in a marly clay with occasional boulders, 6,000 ft. in muskeg and 1,200 ft. in solid rock. The grade line was kept at a minimum depth of 4 ft. 6 ins. to insure at least 3 ft. of cover. In the muskeg sections clay, on which the pipe was laid was found at a depth of about 4 ft.

One 18-in. gate valve was placed near the middle of the line and a second close to the reservoir. A check valve was also placed 50 ft. back from the reservoir and two 18-in. valves in the two bye pass lines leading from the supply main parallel to the east wall and past the reservoir to the two 18-in. pressure mains. A cluster of three 1-in. Brook's air valves at every summit and a 6-in., off 18-in., blow off at every depression, a drainage ditch on a 5-10ths grade being executed at each. Manholes of dry rubble were built over each air valve cluster and over the gate valves. The pipes were of standard specification, the limits of weight being from 1,800 to 1,950 lbs. per 12-ft. lengths.

The entire work was done by day labor, with Mr. Frank Stewardson as superintendent and general foreman. Wages paid were as follows:

Superintendent, per mo.	$150.00
Sub-foreman, per hr.	.40
Blacksmith, per hr.	.35
Calkers, per hr.	.30
Laborers, per hr.	.25

The cost of the work was as follows:

Item.	Total.	Per lin. ft.
Cleaning and grubbing	$ 160	$0.045
Trenching and backfilling rock, labor	1,698	
Materials	193	
Total	$ 1,891	$0.186
Earth, labor	4,504	
Tools and materials	725	
Total	$ 5,229	$0.512
Pipelaying, labor	1,065	0.105
Lead, yarn, tools	1,632	0.160
Total	$ 2,697	$0.265

Cast Iron Pipe:		
760,858 tons at $40	$30,691	....
13,812 sleeves, specials at 3 cts.	414	....
Total	$31,105	....
Less credits	183	....
Net total	$30,922	$3.030
Hauling pipe	2,130	0.209
Manholes, labor	162	....
Materials	54	....
Total	$ 216	$0.021
Valves	652	0.064
Grand total	$44,198	$4.332

Pressure Main From Reservoir.—This line was 12,520 ft. long, including bye-passes. Six inch, off 18-in., "blow-offs" were placed every half mile, as well as at depressions in order to facilitate emptying the pipe line for repairs. Three clusters of three 1-in. Crispin automatic air valves were placed about 4,000 ft. apart. This air valve is apparently an ideal one for its purpose. When the pipe is empty the ball float rests in a seamless brass cup, suspended by brass strips within the outside iron cylinder. There is ample clearance between the side of the cup and the inside of the cylinder. The inlet is at the bottom of the cylinder through an inch pipe, and the outlet at the top is fitted with a treated leather valve seat to form a tight seat for the ball when it floats, and so closes the valve. There are two small drip holes, which drain the cup and permit the ball to sit below the effect of any air rush, and also prevents the collection of sediment. The presence of this cup and the ample surrounding area removes any possibility, even with great air pressure, of the ball being raised to its seat until all the air has escaped. The cylinder being closed entirely, the valve can be kept below frost line and the air permitted to escape through a pipe attached to the outlet. One-inch globe valves were placed on the inlet pipe, between the main pipe and the air valve, to facilitate repairs to the air valves.

The pipe used was 18-in. diameter cast-iron pipe of standard specification, from 1,900 lbs. to 2,000 lbs. for all heads over 200 ft., and 1,800 lbs. to 1,900 lbs. for all heads less than 200 ft., excepting across the property of the Grand Trunk Pacific Ry., where no pipe of less than 2,050 lbs. was used. The pipes were manufactured at the new plant of the Canadian Iron Corporation in Fort William. The line was cut into three sections by two 18-in. geared gate valves.

As there was greater possibility of the territory through which this line passed becoming inhabited, the minimum depth for the invert of the pipe was fixed at 6 ft., but in deference to the wishes of the Grand Trunk Pacific Railway Co. the grade line across their property averaged a depth of 12 ft. A 12-in., off 18 ins., cross was placed for the future water requirements of the Grand Trunk Ry. A small Indian village having been established on the lower portion of the pipe line, three ½-in. fountains, discharging through a masonry head wall into a basin formed from a 2-ft. section of 18-in. pipe, were installed for public use.

It was decided that the sand and swamp portions of the line could be laid more economically during the winter, as at that season the movement of the sub-soil water is more sluggist and the depth of frozen ground obviated the use of sheet piling. These advantages were considered to more than compensate for the cost of shoveling snow and the difficulty of excavating frozen ground. Seven thousand feet of pipe were laid south from the river in February and March of the present year, at an average rate of 372 ft. per day. The upper section of the pipe was laid during May and June.

No unusual features developed during the progress of the work, the cost of which was as follows:

	Per lin. ft.	Total.
Clearing right of way	$0.008	$ 103.50
Excavating trench labor	0.423	5,294.10
Tools	0.028	356.25
Backfilling and tamping	0.104	1,297.34
Total		$ 7,051.19

*Rearranged from an elaborate paper by H. Sydney Hancock, Jr., presented to the Canadian Society of Civil Engineers on the new water supply system costing $500,000 for the city of Fort William, Ontario.

Cast iron pipe (18-in.)	$3.060	$38,310.87
Inspection at foundry	0.021	267.63
Pig lead	0.147	1,832.90
Yarn	0.003	37.15
Specials	0.041	541.56
Hauling material	0.048	607.20
Total		$41,570.61
Skidding and laying pipe, labor	$0.258	$ 3,228.02
Tools, lumber, plant	0.043	537.19
Accident	0.004	52.00
Total		$ 3,817.21
Culverts and road repairs	$0.021	$ 262.81
6 gate valves	0.080	1,007.00
8 blow off valves	0.015	186.43
9 air valves	0.012	151.08
Total		$ 1,344.51
Manholes, fountain, head walls, etc.	$0.057	$ 702.76
Engineering and supt.	0.090	1,131.20
Total cost of pipe line	$4.463	$55,880.29
Repairs and alterations at river crossing		$ 1,015.40
Total cost, Section IV		$56,895.69

In the above work common labor was paid 22½ to 25 cts. per hour, calkers 30 cts. per hour and a superintending foreman $150 per month. Cast-iron pipe cost $36.75 per ton at the local foundry, and specials $65 per ton. Pig lead cost $3.80 per 100 lbs., and yarn 8½ cts. per lb. Nearly half a mile of the line was inaccessible to teams, and as a consequence the cost of skidding and handling pipe was high.

Method of Repairing Steam Shovels on the Panama Canal.

There are 100 steam shovels in use, or ready for use on the Panama Canal work. From 40 to 50 of these are at work in the dry excavation of the Culebra cut. The repairs to this class of machinery are so extensive and the number of shovels here is so large that a machine shop at Empire was built for the especial purpose of repairing steam shovels.

In this shop all the work of repairing is done which is not possible to do in the field or which can be done by way of making ready for the field repairs at night. This shop employs on an average, 28 boilermakers, 10 blacksmiths, 88 machinists, and 202 negro laborers.

For night repairs a regular gang is organized and in the Culebra cut,—which is a stretch of 9 miles with 40 to 50 shovels,—this gang averages 31 boilermakers, 8 machinists and about 10 blacksmiths and 30 laborers. This cut is divided into three sections and the men are distributed according to the demands for that section.

One of the evolutions of the field repair work is a traveling machine shop, which is mounted on a car and hauled from place to place by a locomotive. This shop contains a forge, a drill, a shaper, and a lathe, all driven by compressed air, which is supplied by an air main at whatever point repair work is necessary.

The equipment further includes pneumatic drills and hammers that can be handled by one man, complete sets of machinists' and boilermakers' tools, and a 30-ton locomotive crane.

The largest single field repair made is changing boilers. This operation usually takes all night, but is done in time so that steam may be raised and the shovel ready to dig at starting time in the morning.

The most frequent big repair job done in the field, however, is changing a dipper stick. This is also completed without loss of time. A swing circle, or an A-frame can be put in between sunset and sunrise without taking the shovel from the bench, or trench in which it is working.

The jobs done, of course, require different lengths of time. This field repair gang works all the way from 3 to 13 hours a night, the average being about 7 hours. The work is done in all kinds of weather. By way of systematizing the repair operations it is possible to utilize most of the time of the men. Sometimes a gang will work from 5 to 7 p. m. on a shovel and then on other shovels till midnight or later. Meanwhile the crane will do its work at the first shovel, and after it has left, the men will return to finish the job.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Condensed Facts on the Panama Canal.

The following assembled facts and statistics of the Panama Canal are worth recording for the convenience of those who haven't the time or means to consult the more extensive descriptions and records. They give the very latest figures and are compiled on the authority of the Isthmian Canal Commission.

The Panama Canal.—The entire length of the canal from deep water in the Atlantic to deep water in the Pacific is about 50½ miles. Its length on land is about 40½ miles. In passing through it from the Atlantic to the Pacific, a vessel will enter a channel with a bottom width of 500 ft. in Limon Bay, follow this for about seven miles to Gatun, where it will enter a series of three locks in flight and be lifted 85 ft. to the level of Gatun Lake. It will sail at full ocean speed through this lake, in a channel varying from 1,000 to 500 ft. in width, for a distance of about 24 miles, to Bas Obispo, where it will enter the Culebra Cut. It will sail through the Cut, a distance of about nine miles, in a channel with a bottom width of 300 ft., to Pedro Miguel. There it will enter a lock and be lowered 30⅓ ft. to a small lake, at an elevation of 54⅔ ft. above sea level, and will sail through this for about 1½ miles to Miraflores. There it will enter two locks in series and be lowered to sea level, passing out into the Pacific through a channel about 8½ miles in length, with a bottom width of 500 ft. The depth of the approach channel on the Atlantic side, where the tidal oscillation does not exceed 1½ ft., will be 41 ft. at mean tide, and on the Pacific side, where the maximum oscillation is 23 ft., the depth will be 45 ft. at mean tide.

Gatun Dam.—The Gatun Dam, which will form Gatun Lake by impounding the waters of the Chagres and other streams, will be nearly 1½ miles long, measured on its crest, nearly ½ mile wide at its base, about 400 ft. wide at the water surface, about 100 ft. wide at the top, and its crest, as planned, will be at an elevation of 115 ft. above mean sea level, or 30 ft. above the normal level of the lake. The interior of the dam will be formed of a natural mixture of sand and clay, dredged by hydraulic process from pits above and below the dam, and placed between two large masses of rock and miscellaneous material, obtained from steam shovel excavation at various points along the canal. The top and upstream slope will be thoroughly riprapped.

The spillway is a concrete lined opening, 1,200 ft. long and 300 ft. wide, cut through a hill of rock nearly in the center of the dam, the bottom of the opening being 10 ft. above sea level. During the construction of the dam, all the water discharged from the Chagres and its tributaries will flow through this opening. When construction has sufficiently advanced to permit the lake to be formed, the spillway will be closed with a concrete dam, fitted with gates and machinery for regulating the water level of the lake.

Dams on Pacific Side.—The water level of Gatun Lake, extending through the Culebra Cut, will be maintained at the south end by an earth dam connecting the locks at Pedro Miguel with the high ground to the westward, about 1,700 ft. long, with its crest at an elevation 105 ft. above mean tide.

A small lake between the locks at Pedro Miguel and Miraflores will be formed by dams connecting the walls of Miraflores locks with the high ground on either side. The dam to the westward will be of earth, about 2,700 ft. long, having its crest about 15 ft. above the water in Miraflores Lake. The east dam will be of concrete, about 500 ft. long, and will form a spillway for Miraflores Lake, with crest gates similar to those at the spillway of the Gatun Dam.

Gatun Lake.—Gatun Lake will cover an area of 164 square miles, with a depth in the ship channel varying from 85 to 45 ft. Throughout the first 16 miles from Gatun, the width of the channel will be 1,000 ft.; then for 4 miles, it will be 800 ft., and for 4 miles more 500 ft., when the entrance to Culebra Cut, at Bas Obispo, will be reached. The water level in the cut will be that of the lake, and the bottom width of the channel will be 300 ft.

The Canal Zone.—The Canal Zone contains about 448 square miles. It begins at a point three marine miles from mean low water mark in each ocean, and extends for five miles on each side of the center line of the route of the canal. It includes the group of islands in the Bay of Panama named Perico, Naos, Culebra, and Flamenco. The cities of Panama and Colon are excluded from the Zone, but the United States has the right to enforce sanitary ordinances in those cities, and to maintain public order in them in case the Republic of Panama should not be able, in the judgment of the United States, to do so.

Of the 448 square miles of Zone territory, the United States owns about 322 square miles. Under the treaty with Panama, the United States has the right to acquire by purchase, or by the exercise of the right of eminent domain, any lands, buildings, water rights, or other properties necessary and convenient for the construction, maintenance, operation, sanitation, and protection of the canal, and it can, therefore, at any time acquire the 126 square miles within the Zone boundaries, which are now owned by private persons.

The Locks.—There will be 12 locks in the canal, all in duplicate; three pairs in flight at Gatun, with a combined lift of 85 ft.; one pair at Pedro Miguel, with a lift of 30⅓ ft., and two pairs at Miraflores, with a combined lift of 54⅔ ft. at mean tide. The dimensions of all are the same—a usable length of 1,000 ft., and a usable width of 110 ft. Each lock will be a chamber, with walls and floor of concrete, and water-tight gates at each end.

The side walls will be 45 to 50 ft. wide at the surface of the floor; will be perpendicular on the face, and will narrow from a point 24⅓ ft. above the floor until they are 8 ft. wide at the top. The middle wall will be 60 ft. wide, approximately 81 ft. high, and each face will be vertical. At a point 42⅓ ft. above the surface of the floor, and 15 ft. above the top of the middle culvert, this wall will divide into two parts, leaving a space down the center much like the letter U, which will be 19 ft. wide at the bottom. In this center space, which will be 44 ft. wide at the top, will be a tunnel divided into three stories, or galleries. The lowest gallery will be for drainage; the middle, for the wires that will carry the electric current to operate the gate and valve machinery, which will be installed in the center wall; and the upper will be a passageway for the operators. The lock chambers will be filled and emptied through lateral culverts in the floors, connecting with main culverts, 18 ft. in diameter, in the walls, the water flowing in and out by gravity.

The lock gates will be steel structures 7 ft. thick, 65 ft. long, and from 47 to 82 ft. high. They will weigh from 300 to 600 tons each. Ninety-two leaves will be required for the entire canal, the total weighing 57,000 tons. Intermediate gates will be used in the locks, in order to save water and time, if desired, in locking small vessels through, the gates being so fixed as to divide the locks into chambers 600 and 400 ft. long, respectively. Ninety-five per cent of the vessels navigating the high seas are less than 600 ft. long. In the construction of the locks, it is estimated that there will be used approximately 4,500,000 cu. yds. of concrete, requiring about the same number of barrels of cement.

No vessel will be permitted to enter or pass through the locks under its own power. Electricity will be used to tow all vessels into and through the locks, and to operate all gates and valves, power being generated by water turbines from the head created by Gatun Lake.

The time required to pass a vessel through all the locks is estimated at 3 hours, 1½ hours in the three locks at Gatun, and about the same time in the three locks on the Pacific side. The time of passage of a vessel through the entire canal is estimated as ranging from 10 to 12 hours, according to the size of the ship, and the rate of speed at which it can travel.

Excavation.—The total excavation, dry and wet, for the canal, as originally planned, was estimated at 103,795,000 cu. yds., in addition to the excavation by the French companies. Changes in the plan of the canal, made subsequently by order of the President, increased the amount to 174,666,594 cu. yds. Of this amount, 89,794,493 cu. yds. were to be taken from the Central Division, which includes the Culebra Cut. Active excavation work on a large scale did not begin till 1907, when 15,765,290 cu. yds. were removed. In 1908, over 37,000,000 cu. yds. were removed, and in 1909, over 35,000,000, making a total for the two years of over 72,000,000 cu. yds., or a monthly average for those two years of 3,000,000 cu. yds. The total for these two years was nearly one-half of the entire excavation for the canal. On April 1, 1910, the excavation exceeded 103,000,000 cu. yds., nearly the entire amount called for in the original plan. Records of all excavation to April 1, 1910, are appended:

	Cubic yards.
By French companies	78,146,960
French excavation useful to present canal	29,908,000
By Americans—	
Dry excavation	63,785,629
Dredges	39,420,037
Total	103,205,666
May 4 to Dec. 31, 1904	243,472
Jan. 1 to Dec. 31, 1905	1,799,227
Jan. 1 to Dec. 31, 1906	4,948,497
Jan. 1 to Dec. 31, 1907	15,765,290
Jan. 1 to Dec. 31, 1908	37,116,735
Jan. 1 to Dec. 31, 1909	35,096,166
Jan. 1 to April 1, 1910	8,236,279

There have been expended for pavements, water works, sewers, etc., in the cities of Panama and Colon about $2,500,000, and work under an additional appropriation of $800,000 is now in progress in these cities, making $3,300,000 in all. This sum will be returned to the United States treasury by water rates collected by the United States during a period of 50 years.

Canal Force.—On March 23, 1910, the total force of the Isthmian Canal Commission and Panama Railroad Company, actually at work, was 38,732, divided as follows:

	Gold.	Silver.	Total.
Isthmian canal commission	4,499	26,217	30,716
Panama railroad company (proper)	557	3,336	3,893
Panama railroad relocation	158	3,000	3,158
Panama railroad commissary	215	750	965
Total	5,429	33,303	38,732

The gold force is made up of the officials, clerical force, construction men, and skilled artisans of the Isthmian Canal Commission and the Panama Railroad. Practically all of them are Americans. The silver force represents the unskilled laborers of the Commission and the Panama Railroad. Of these, about 5,000 are Europeans, mainly Spaniards, with a few Italians and other races. The remainder, about 28,000, are West Indians, about 4,000 of whom are employed as artisans receiving 16, 20, and 25 cts., and a small number, 32 and 40 cts., an hour. The standard rate of the West Indian laborer is 10 cts. an hour, but a few of these doing work of an exceptional character are paid 16 and 20 cts. The larger part of the Spaniards are paid 20 cts. an hour, and the rest 16 cts. an hour.

Old French Buildings.—The Americans acquired from the French 2,150 buildings of various kinds. Of this number 1,537 have been placed in use. Their estimated value at the time they were turned over to the Americans was about $2,000,000. The Commission has spent on these buildings about $890,000, making their value today about $2,890,000.

Subsistence Department.—The Subsistence Department is divided into two branches—commissary and hotel. It does about $7,000,000 worth of business a year, two-thirds of this through the commissaries, and one-third through the hotels. It feeds, clothes and provides with necessities, approximately 50,000 persons. The department is self sustaining.

The commissary system consists of 13 general stores in as many Canal Zone villages, and three camps along the re-located line of the Panama Railroad. No goods are sold for cash, only coupons issued to employes being accepted in payment for purchases.

The hotel branch maintains the Hotel Tivoli at Ancon, and also 18 hotels for white gold employes, at which meals are served for 30 cts. each; 18 messes for European laborers, who pay 40 cts. per ration of three meals, and 17 kitchens for West Indian laborers, who are charged 30 cts. per ration of three meals. There are served monthly in the hotels for white gold employes, 188,000 meals; in the messes, 269,000 meals; and in the kitchens, 180,000 meals. The supplies for one month cost about $90,000; labor and other expenses, $21,000. The monthly receipts, exclusive of the revenue from the Hotel Tivoli at Ancon, amount to $112,000.

A cold storage and ice making plant, bakery, coffee roaster, ice cream factory, and similar plants, and a laundry, are operated at Cristobal, and warehouses are maintained there near the wharves, at which goods from the States are delivered. Every morning a supply train takes ice and foodstuffs to the towns along the line of the canal, the perishable goods being conveyed in refrigerated cars.

TABLE I.—EXCAVATION BY DIVISIONS, MAY 4, 1904, TO APRIL 1, 1910.

Divisions.	Amounted Excavated. Cubic yards.	Total.	Estimated Amount Yet to be Excavated Cubic yards	Total
Atlantic—				
Dry excavation	6,791,280		2,770,631	
Dredges	17,574,568	24,365,848	15,940,831	18,711,462
Central -				
Culebra Cut	45,624,605		32,417,690	
All other points	8,655,533	54,280,138	3,096,665	35,514,355
Pacific—				
Dry excavation	2,714,211		3,216,369	
Dredges	21,845,469	24,559,680	14,018,742	17,235,111
Grand totals		103,205,666		71,460,928

TABLE II—CANAL APPROPRIATIONS AND EXPENDITURES.

Appropriations.	
Payment to the New Panama Canal Company	$ 40,000,000.00
Payment to Republic of Panama	10,000,000.00
Appropriation for 1902	10,000,000.00
Appropriation for 1906	11,000,000.00
Deficiency for 1906	5,990,786.00
Appropriation for 1907	25,456,415.08
Appropriation for 1908	27,161,367.50
Deficiency for 1908	12,178,900.00
Appropriation for 1909	29,187,000.00
Deficiency for 1909	5,458,000.00
Appropriation for 1910	33,638,000.00
Total to date	$210,070,468.58

Classified Expenditures to March 1, 1910.	
Department of construction and engineering	$ 63,143,128.14
Department of construction and engineering, plant	22,471,687.32
Department of sanitation	10,884,410.18
Department of civil administration	3,926,853.36
Panama railroad second main track	1,107,910.78
Panama railroad relocated line	4,354,137.56
Purchase and repair of steamers	2,555,009.17
Zone water works and sewers	3,270,248.92
Zone roadways	1,429,752.67
Loans to Panama railroad company	3,718,567.03
Construction and repair of buildings	9,574,865.12
Miscellaneous	3,960,658.21
Total	$136,397,228.44

TABLE III—SCHEDULE OF EQUIPMENT.

Relocated Panama Railroad.—The new, or relocated line of the Panama Railroad is 46.2 miles long, or about 1 mile shorter than the old line. From Colon to Mindi, 4.17 miles, and from Corozal to Panama, 2.83 miles, the old location is used, but the remaining 36 miles are new road. From Mindi to Gatun, the railroad runs in general parallel to the canal, and the maximum grade of the line, 1¼ per cent, is in this stretch, where the ascent from nearly mean sea level to 95 ft. above is made. At Gatun, the road leaves the vicinity of the canal and runs east along the valley of the Gatun River to a point about 4½ miles from the center line of the canal, where it turns southward again, and skirts the east shore of Gatun Lake to the beginning of Culebra Cut, at Bas Obispo. In this section there are several large fills, and the maximum elevation of the line is reached, 110 ft. above mean sea level. Through Culebra Cut, the road will run on a berm on the east

TABLE IV—GENERAL CANAL STATISTICS.

Length from deep water to deep water	50½ miles.
Length on land	40½ miles.
Bottom width of channel, maximum	1,000 feet.
Bottom width of channel, minimum, 9 miles, Culebra cut	300 feet.
Locks, in pairs	12
Locks, usable length	1,000 feet.
Locks, usable width	110 feet.
Gatun Lake, area	164 sq. m.
Gatun Lake, channel depth	85 to 45 feet.
Excavation, estimated total	174,666,594 c. y.
Excavation, amount accomplished April 1, 1910	103,205,666 c. y.
Excavation by the French	78,146,960 c. y.
Excavation by French, useful to present canal	29,908,999 c. y.
Concrete, total estimated for canal	5,000,000 c. y.
Time of transit through completed canal	10 to 12 hours.
Time of passage through locks	3 hours.
Relocated Panama railroad, estimated cost	$7,125,000
Relocated Panama railroad, length	46.2 miles.
Canal zone, area	about 448 sq. m.
Canal zone area, owned by United States	about 322 sq. m.
French buildings, number acquired	2,150
French buildings, number used	1,537
French buildings, net value when acquired	$1,959,203
Value of utilized French equipment	$1,000,000
Canal force, actually at work	about 39,000
Canal force, Americans	about 5,500
Cost of Canal, estimated total	$375,000,000
Work begun by Americans	May 4, 1904
Date of completion	Jan. 1, 1915

side, 10 ft. above the surface of the water. From the south end of Culebra Cut, at Paraiso, it will run practically parallel with the canal to Panama. The maximum grade between Gatun and Panama is 0.45 per cent, and the maximum curvature is 6°. Where the railroad crosses the Gatun River, a bascule steel bridge is to be erected, and a steel girder bridge ¼ mile long with a 200-ft. truss channel span, is in use across the Chagres river at Gamboa. Smaller streams are crossed on concrete culverts. Near Miraflores, a tunnel 736 ft. long has been built through a hill. The cost of the new line is estimated at $7,225,000.

Cost of Crushing Stone for Concrtee Lining of Pennsylvania Railroad North River Tunnels.*

The stone worked was the trap rock spoil from the Bergen Hill Tunnel. The plant consisted of a No. 6 and a No. 8 Austin crusher driven by an Annex, single cylinder, horizontal steam engine of 120 HP. and was capable of crushing about 225 cu. yds. of stone per 10-hour day. The crushers and conveyors were driven from a countershaft, in turn driven from the engine by an 18-in belt.

The process of crushing was as follows: The stone from the pile was loaded by hand into scale-boxes which were lifted by two derricks into the chute above the No. 6 crusher. One derrick had a 34-ft. mast and a 56-ft. boom, and was worked by a Lidgerwood steam hoister; the other had a 23-ft. mast and a 45-ft. boom, and was worked by a "General Electric" hoist. All the stone passed first through the No. 6 crusher, after which it was lifted by a bucket conveyor to a screen, placed about 60 ft. higher than and above the stone bin. The screen was a steel chute pierced by 2½-in. circular holes, and was on a slope of about 45°; in order to prevent the screen from choking, it was necessary to have two men continually scraping the stone over it with hoes. All the stone passing the screen was discharged into a bin below with a capacity of about 220 cu. yds. The stone not passing the screen passed down a diagonal chute to a No. 3 crusher, from which, after crushing, it was carried back by a second bucket conveyor to the bin, into which it was dumped without passing a screen. The No. 3 crusher was arranged so that it could, when necessary, receive stone direct from the stone pile. The cars in which the stone was removed could be run under the bin and filled by opening a sliding door in the bottom of the bin. A track was laid from the bin to connect with the contractor's surface railway in the Weehawken Shaft yard and on this track the stone could be transported either to the Weehawken Shaft direct, for use on that side of the river, or to the wharf, where it could be dumped into scows for transportation to New York. The cars used were 3-cu. yd. side-dump, with flap-doors, and were hauled by two steam Dinky locomotives.

The average force employed was:

	Per day
1 foreman supervising at	$3.00
24 laborers loading scale-boxes for derricks at	1.75
4 laborers feeding crushers at	1.75
2 laborers watching screens to prevent clogging at	1.75
1 engineer driving steam engine at	4.00
2 engineers on derricks at	3.50
1 night watchman, watching the plant at night.	

Owing to the constant break-down of machinery, chutes, etc., inseparable from stone-crushing work, there was always at work a repair gang consisting of either three carpenters or three machinists, according to the nature of the break-down.

The approximate cost of the plant was:

Machinery	$ 850
Lumber	3,305
Erection labor	3,999
Total	$13,154

The cost of the crushed stone at Weehawken amounted to about $0.91 per cu. yd., and was made up as follows:

Cost of stone	$0.22
Labor in operation of plant	0.31
Plant supplies	0.11
*Plant depreciation	0.27
Total	$0.91

The crushed stone at the Manhattan Shaft cost about $1.04 per cu. yd., the difference of $0.13 from the Weehawken cost being made up of the cost of transfer across the river, $0.08, and transport from the dock to the shaft, $0.05.

*Extract from a paper by B. H. M. Hewett and W. L. Brown. Proceedings American Society of Civil Engineers, Vol. XXXVI. p. 690.

*Assuming that the scrap value of derricks and engines is one-half the cost, crushers one-third the cost, and other items nothing.

Review Index.

The following items and reviews were for lack of space held out of the Monthly Review Index for May 11, 1910. As it is our practice to index all articles within as nearly as possible 30 days from their publication, we continue the omitted items here.

BOOK REVIEWS.

Dust Preventives and Road Binders.—By Prevost Hubbard. New York: John Wiley & Sons. London: Chapman & Holl, Ltd. Cloth, 6 x 9 ins. 416 pp. $3.

Two of the most important problems which at the present time confront road engineers are the prevention or suppression of road dust and the preservation of roads. At the first International Road Congress in 1908 it was brought out that the solution of these problems lies in the treatment of both old and new roads with chemical substances known as dust preventives and road binders. To supply specific information relative to the chemical and physical characteristics of these dust preventives and road binders, which will enable the road engineers to select and specify materials best suited to his needs, and also to give the best method of applying such materials, is the purpose of Mr. Hubbard's book.

The conclusions presented in the book are based upon experience which the author has acquired both in the laboratory and in the field in the past five years of his service with the U. S. Office of Public Roads. That Mr. Hubbard is well qualified to write on these subjects is shown by the fact that during his connection with the office of Public Roads he has had under his personal supervision the examination of practically all varieties of road binders and their use under varying conditions in many parts of the United States.

The book is divided into 15 chapters and an appendix. A brief summary of these chapters will perhaps show the scope of the book.

Chapter I deals with the problems of dust prevention and road preservation. The relations between the two problems are discussed and methods of solving them given. Chapter II describes the classification of dust preventives according to their use and chemical characteristics. In Chapter III and IV the inorganic dust layers and road binders are considered in some detail both as regards their chemical and physical characteristics, methods of application and examination. Chapter V treats of a number of organic non-bituminous materials such as animal oils and fats, waste sulphite liquors, etc., with reference to their use as dust layers and road binders. Chapter VI deals with the chemical composition and constitution of bitumens. In Chapter VII bituminous material, including native bitumens, pyro-bitumens and artificial bitumens are described and classified with special reference to their use as dust preventives and road binders. Chapter VIII reviews the production and characteristics of petroleums, together with the products of manufacture which are of interest from the standpoint of road treatment. In Chapter IX the physical and chemical characteristics of the semi-solid and solid native bitumens are considered with especial reference to their use as road binders. Chapter X deals in some detail with the surface treatment and construction of earth, gravel and broken stone roads with oil and oil products. The methods of doing the work in order to obtain the best results are quite fully described. In Chapter XI the characteristics of various tars with relation to the treatment of roads is discussed and the methods of preparing them described. This chapter should serve as a working basis for future investigations and should prove of some service to the road engineer in enabling him to form a correct idea of the properties most essential in tars that are to be used as dust preventives and road binders. In Chapter XII the author describes the application of various kinds of the macadam road surfaces and the construction of bituminous macadam roads in general. Chapter XIII describes various tests for bituminous road materials and the interpretation of the results, which should enable the road engineer not only to make an intelligent examination of materials which he has occasion to use, but should also enable him to judge from such an examination as to the value of any given material for a given purpose. Chapter XIV deals with the methods of examination of road materials proposed or adopted by the American Society of Testing Materials, and the American Society of Civil Engineers. In Chapter XV the author develops the principles which should govern the selection and specification of dust preventives and road binders.

Bridge and Structural Design.—By W. Chase Thomson. New York: The Engineering News Publishing Co. Cloth, 6 x 9 ins. pp. 192; illustrated. $2.

In its first edition this book was one of the most useful to the practical working students and draftsmen that had been published in recent years. The present second addition presents the same practically useful matter entirely rewritten and considerably extended. As it stands the work is one of the most satisfactory of any we know of to place in the hands of the draftsman and designer in the office or the engineer having occasional bridge work to do in his general practice. The examples of typical structures in the latter portions in which the stresses are analysed, the numbers proportioned and the details carefully worked out are particularly valuable in practical information. The examples given embrace, each in a separate chapter, an office building, a simple roof truss, a roof truss supported by steel columns, a plate girder, a 50 ft. Warren highway bridge, a pin connected Pratt truss highway bridge. A concluding chapter gives coefficients for stresses in various types of trusses. The first five chapters treat of the general principles of design. The publishers' work on the book is excellent.

Modern Location of Standard Turnouts.—By C. M. Kurtz, Construction Department Southern Pacific Co., San Francisco, Cal. Published by the author. Leather, 4 x 6½ ins. 51 pp.; illustrated. $1.25.

This little volume contains a very large amount of valuable information for the use of civil engineers, transit men and draftsmen for the purpose of planning and staking out almost any kind of turnout curve. The author treats the switch problems in a novel and comprehensive way, making the main curve beyond the frog tangent and the frog tangent important factors to be considered in the lay out of sidings and switching yards. Very complete instructions for the guidance of transitmen are given whereby to stake out correctly any required combination, the book giving the necessary tables from which to select the values already computed for the various cases. There are five chapters in the book of which the first explains the new methods of the author; the second treats on turnouts from tangents; the third on turnouts from curves; the fourth on symmetrical Y-tracks, and the fifth describes the traverse method of solving switch problems.

Municipal Franchises.—Vol. 1. By Delos F. Wilcox. Engineering News Book Department, New York, N. Y. Cloth 5¾x8 ins.; 710 pp.; $5.

This book is an analysis and description of municipal franchises as they exist in American cities. The author gives an introductory analysis of the modes of acquiring franchise rights, of the nature of franchises and of the various possible means of restricting public utility monopolies under private operations. The several classes of municipal franchises are then taken up in order. In most cases a sketch is given of the history and importance of the utility and the special ways in which it is related to the city. There follows a description of typical franchises in actual operation in different cities. As indicated in the title given above the volume before us is the first volume of a two-volume

treatise. The utilities discussed in this volume are electric light and power, telephone, telegraph, electric signals and conduits, water supply, sewerage, central heating, refrigeration, pneumatic tubes, oil pipe lines and artificial and natural gas. In the second volume which is to follow, the various classes of transportation and terrestrial franchises will be discussed. This second volume will also contain the author's conclusions in regard to the taxation and control of public utilities.

PUBLICATIONS RECEIVED.

Public Service Commission; Second District; State of New York.—Second Annual Report. 1908. Albany, N. Y. Published by the Public Service Commission. Cloth; 6 x 9 ins.; Vol. I. 933 pp.; Vol. II. 716 pp.; Vol. III. 9½ x 12 ins. 318 pp.

The commission has supervision over 851 corporations, municipalities and individuals engaged in serving the public and the report is interesting to statisticians. Volume II. deals with uniform systems of accounts.

Standard Specifications for Cast Iron Pipe and Special Castings.—American Water Works Association, Charleston, S. C. J. M. Diven, Secretary. Paper. 6 x 9 ins. 33 pp.

This pamphlet should be in the hands of every water works official.

Representative Cement Houses.—Universal Portland Cement Co., Chicago, Ill. Paper. 6 x 9 ins. 130 pp.; illustrated. 50 cts.

This book has a handsome cover in colors and contains on every page a view of an attractive concrete or stucco house. The text is descriptive of the houses in a general way.

Paving Practice with Respect to Crowns of Roadway Pavements and Concrete Foundations.—By George C. Warren. Boston, Mass. Warren Brothers Company. Paper, 6 x 9 ins. 16 pp.

This pamphlet contains a paper, with all the discussion thereon, read by the author before the 1909 Little Rock, Ark., convention of the American Society of Municipal Improvements and reprinted from the proceedings of the society.

Notes on Going Value and Method for its Computation.—By John W. Alvord, Chicago, Ill. The author, Hartford Building. Paper, 6 x 9 ins. 95 pp.

This pamphlet contains a paper, with full discussion thereon, read by the author before the 1909 Milwaukee, Wis., convention of the American Water Works Association and reprinted from the proceedings. A valuable paper on the valuation of public utilities plants.

INDEX ITEMS.

A New Theory for Earth Pressure.—R. R. Aggs. Gaz., April 15, 1910. 8½ pp.

From a paper presented at the Western Society of Engineers by Chas. K. Mohler, engineer for the Loop Protective Association of Chicago. He departs from the text-book theory that if a wall is designed so that the resultant of the forces acting on the base cuts the base inside the middle third the wall is safe from overturning. This is, he says, safe for only one condition, viz., on a rigid or solid rock foundation. Formulas and diagrams are given.

The Salmon River Dam and Irrigation Project, Idaho.—Eng. Rec., April 2, 1910. 5½ pp.

Illustrates and describes structural details of concrete dam 463 ft. long on the crest. Gives lengthy general description of construction plant and methods with some useful details on the form work.

Cement Mill Accounting.—By T. B. Cornell. Am. Rec., April, 1910. 1¼ pp.

A system of distribution of operating accounts of a cement manufacturing plant.

Unreliability of the Cold Plunge Test for Cement.—Cem. & Eng. News, April, 1910. 1¾ pp.

A paper presented by Arthur C. Davis before the Institution of Civil Engineers.

Plaster, Overburnt Gypsum and Hydraulic Gypsum.—By M. Glasenapp. Cem. & Eng. News, April, 1910. 4 pp. Continued from March.

An essay describing the various products obtained by heating and calcining of native gypsum, based upon an extensive microscopical research intended to throw light upon the excellent properties of some kinds of burnt gypsum and to end the confusion existing in the classification of gypsum products. Illustrated with numerous photographs of miscroscopic sections.

Concrete Reinforcement. A Unit Truss.—By E. White, C. E. Conc. Eng., April, 1910. 3 pp.

A description, illustrated, of a series of six tests to determine the practicability of the principal of turning up reinforcing bars in a beam to take diagonal tension.

Concrete Barges at Panama. — Conc. Eng., April, 1910. 1 p.

A description. Illustrated.

The Ideal Specification for Cement.—By E. P. Goodrich. Contr., April 1, 1910. 1 p.

An argument for limiting the requirements of the standard specifications for cement.

How a Pier Was Built and Its Cost.—Contr., April 1, 1910. 2¾ pp.

Article condensed from a paper by T. Howard Barnes, read before the American Society of Civil Engineers. It gives the details of construction and cost of a pier at Bocas del Toro, Panama, for the United Fruit Company.

Results of Tests for Leakage Under Pressure of a Reinforced Concrete Pipe. — Eng.-Contg., April 27, 1910. ⅓ p.

Describes method of testing 11-ft. reinforced concrete conduit and gives results showing amount of leakage at various pressures up to 125 ft.

Method of Constructing Reinforced Concrete Trestles for Railways, With Some Costs.—Eng.-Contg., April 27, 1910. 2½ pp.

Describes and discusses economics of reinforced concrete standard trestle construction employed on the C., B. & Q. R. R. Some general costs are given.

Methods and Cost of Constructing Concrete Lock on the Illinois and Mississippi Canal.—Eng.-Contg., April 27, 1910. 3¼ pp.

Describes construction of lock and subsidiary structures, giving full details of plant, layout and methods and itemized costs.

The North Shore Channel of the Sanitary District of Chicago; Methods and Some Costs on Sections Four and Six.—Eng.-Contg., April 27, 1910. 1¼ pp.

Describes methods of excavation with drag line scraper excavators with records of output and estimates of cost.

Relative Cost of Municipal Work Done by Day Labor and by Contract.—By Harrison P. Eddy, Consulting Civil Engineer, Boston, Mass. Can. Engr., April 8, 1910. 3¼ pp.

A careful study, with tables and diagrams, of the labor conditions obtained in the sewer and water departments of the city of Boston.

Cost of Generating Electric Power for Operating the Elevated and Subway Cars in Manhattan, New York City.—Eng.-Contg., April 27, 1910. ⅔ p.

Itemizes equipment and gives full unit operating costs.

Applications of Descriptive Geometry to Mining.—By Joseph W. Roe. Min. Wld., April 23, 1910. 4⅓ pp.

Some of the principals involved are used unconsciously by the engineer in his everyday work. The author attempts (and very well) to recall some of the college text-book principals and place them before the reader in terms of everyday use. Different problems are worked out, i. e., finding the strike, the dip, depth of shaft, length of tunnel, limits of an ore dump, location of ridge for maximum capacity and other interesting problems with diagrams.

Personals.

Mr. Carl E. Plum has been reappointed City Engineer of Elgin, Ill.

Mr. C. B. M. Craig has been appointed City Engineer of Hancock, Mich.

Dr. Harvey W. Wiley, Chief of the Bureau of Chemistry of the Department of Agriculture, has been elected president of the United States Pharmacopoeial Convention, to serve a term of ten years.

Mr. W. A. Bowden, heretofore Designing Engineer of the Department of Railways and Canals of Canada, has been promoted to the position of Chief Engineer, with headquarters at Ottawa, Ont.

Mr. A. W. Genet, for a number of years a Superintendent of Construction for the MacArthur Bros. Co., of New York and Chicago, has gone into the general contracting business at Pittsburg, Pa.

At a meeting of the Commercial Club of Kansas City, Mo., on May 8, Mr. R. E. McDonnell, of the firm of Burns & McDonnell, Consulting Engineers, delivered an address on the value of an adequate supply of pure water for Kansas City.

Mr. George M. Merrill and Mr. Robert M. Sears have entered into a partnership under the firm name of Merrill & Sears, with offices at 274 Main street, Springfield, Mass., and will continue the civil engineering and surveying practice of George N. Merrill & Co.

Dr. B. E. Fernow, head of the Department of Forestry at the University of Toronto, has been selected to represent the Canadian Conservation Commission at the International Association of Forest Experiment Stations at Brussels, Belgium. Dr. Fernow will also represent the commission at the International Congress of Geology to be held shortly at Stockholm, Sweden.

The following changes in the engineering department of the Chesapeake & Ohio Ry. have been announced: Mr. F. I. Cabell, Engineer of Maintenance of Way at Richmond, Va., has been made Chief Engineer of Maintenance of Way. Mr. C. W. Johns, formerly Assistant Engineer of Maintenance of Way at Hinton, W. Va., has been made Engineer of Maintenance of Way of the West Virginia general division. Mr. F. B. Isaacs and Mr. L. B. Allen, Division Engineers, have been appointed Engineers of Maintenance of Way of the Virginia and Kentucky general divisions, respectively.

Mr. A. L. Harris, who recently resigned from the U. S. Reclamation Service after seven years' service as Assistant Engineer, has opened an office at Phoenix, Ariz., where he will engage in practice of engineering connected with irrigation works, hydraulic developments and structural work. During his service with the U. S. Reclamation Service Mr. Harris spent practically the whole time on or about the Roosevelt dam, under Mr. Louis C. Hill, supervising engineer. He designed the Granite Reef Dam near Phoenix and other power plants and irrigation structures in connection with the Salt River project.

Among the addresses to be delivered at the meeting of the Kansas State Municipal League at Wichita, Kan., on May 18 and 19, are the following: An address will be made by David E. Heinman, president of the League of American Municipalities. Mr. R. E. McDonnell, M. Am. Soc. C. E., of the firm of Burns & McDonnell, will give an illustrated lecture on sewage disposal, giving illustrations of the principal sewage purification works in American and European cities. The State Board of Health of Kansas will be represented by Mr. Deocon, who will speak on the relation of the Health Department to municipal officers.

Mr. Morril B. Spaulding, a Consulting Mining Engineer of New York City, was badly injured last week in an accident in an abandoned gold mine at Cheraw, S. C. Mr. Spaulding's right led was so badly crushed when an elevator crashed down a shaft in the mine that surgeons on May 12 amputated the member in an effort to save Mr. Spaulding's life. The accident occurred while Mr. Spaulding and several workmen were ascending from the pit of the mine. The car fell 100 feet when a rope broke, and one of the workmen was crushed to death at the bottom of the shaft. Mr. Spaulding was rescued after several hours, and was brought to New York for an operation. The mine had recently been purchased by a syndicate, and Mr. Spaulding had been engaged to make an examination of the property to determine the extent of the vein and the value of the ore.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on June 15 to secure eligibles from which to make certification to fill at least 50 vacancies in the position of surveyor, at $1,400 per annum each, in the Philippine service, and similar vacancies as they may occur in that service. Field expenses are allowed appointees when absent on duty from their permanent station. It will not be necessary for applicants to appear at any place for examination. Their eligibility for the position will be determined upon the evidence furnished in application Form 375 concerning their education, training and experience. Applicants qualified as follows will be acceptable as surveyors: (a) Senior year students in civil engineering who are attending recognized technical schools or colleges, and whose records are satisfactory; (b) persons who have had not less than three years' good experience in general land and topographic surveying and in addition thereto a good general education. Applicants should at once apply to the United States Civil Service Commission, Washington, D. C., for application Forms 2 and 375.

Walter C. Kerr, President of Westinghouse, Church, Kerr & Co., died May 8 at Rochester, Minn., where he had gone to undergo an operation for cancer. Mr. Kerr was born in St. Peter, Minn., in 1858. He was graduated from the mechanical engineering department of Cornell University in 1879, remaining, however, at Sibley College, Cornell, an instructor and later as assistant professor until 1883. In 1884 when the firm of Westinghouse, Church, Kerr & Co. was organized he became one of its officers. At one time Mr. Kerr was vice-president of the Westinghouse Machine Co., and at the time of his death he was a director of the Electric Properties Co. He was a member of the American Society of Mechanical Engineers, the Canadian Society of Civil Engineers and the Franklin Institute and an Associate of the American Institute of Electrical Engineers. He was also a member of the Engineers' Club of New York City, the New York Railroad Club and several others. Since 1890 he had been a trustee of Cornell University. Mr. Kerr's residence for the past fourteen years was at Dongan Hills, Staten Island.

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The Board of Water Supply of New York city is now calling for bids on one of the few remaining construction contracts in connection with the new Catskill water supply for New York city. This is Contract No. 80 and calls for the construction of the Breakneck tunnels, portions of the Hudson River division of the Catskill aqueduct, comprising about 710 ft. of plain concrete conduit, known as aqueduct in open cut or cut and cover aqueduct, 17 ft. high by 17 ft. 6 ins. wide inside, and a tunnel on the hydraulic gradient, about 1,055 ft. long, 17 ft. high by 13 ft. 4 ins. wide inside, connecting by a shaft about 590 ft. deep with a deep pressure tunnel 14 ft. inside diameter and about 700 ft. long. The work is located in the towns of Fishkill, Dutchess County, and Phillipstown, Putnam County, N. Y.—Congress has passed the bill establishing a bureau of mines and mining in the Department of the Interior The creation of the bureau was recommended two or three years ago by President Roosevelt and later by President Taft.—The city of Waterbury, Conn., is now calling for bids for the construction of a storage reservoir dam, which calls for a considerable amount of work. The principal items in the work are 30,600 cu. yds. of concrete masonry and 525,000 cu. yds. of rolled embankment. Bids are to be opened June 7.—Wenatchee, Wash., has just let a large sewer contract. Wetzel & Foster, Spokane, Wash., secured the contract at $227,000.—Several eastern railroads are about ready for bids on a considerable amount of construction work. Chief of these is the Boston & Albany R. R., which will be ready shortly to take bids for third tracking between Greenbush and Rensselaer, N. Y., and for constructing a tunnel at State Line.—A number of new steam and electric lines are planning to have construction work started soon. Among these may be noted the following: The Crosbyton-South Plains R. R., 120 miles of line, from Crosbyton, Tex., to Lubbock, Tex.; the Coeur d'Alene & Pend Areille Ry. for constructing 24 miles of branch lines for the Spokane International Ry.; the Scio-Lacomb & Jordan Valley R. R. of Scio, Ore., for about 15 miles of line; Prairie Farm & Southwestern Ry. for a number of miles of road from Prairie Farm, Wis., and the Southwestern New York Traction Co. for 15 miles of line from Bolivar to Wellsville, N. Y.—Among the railroad construction contracts let recently are the following: D. D. Morgan, for the grading and bridge building for the last 10 miles of the Laramie, Hahns Peak & Pacific R. R. at Hebron, Colo.; Lewis F. Shoemaker & Co., Philadelphia, Pa., for constructing a number of signal bridges in that city for the Philadelphia & Reading Ry.; the C. H. Sharp Contracting Co., Kansas City, Mo., for revising the grades of the Santa Fe Ry. between Temple and Coleman, Tex.; Donald Jeffry, for the construction of a section of the Chicago & Northwestern line between Tunnel City, Wis., and Raymore; the O'Boyle Construction Co., for the construction of 31 miles of railroad from Hawk Lake, Ont., to Hobon, which will connect the C. P. R. and the A. C. R.; P. V. Clark, Clinton, Ia., for building 15 reinforced concrete bridges for the Chicago & Northwestern Ry., four on the Anamosa division, one on the Iowa division and 10 on the Iowa and Minnesota; S. Dolman & Son, North Topeka, Kan., for building 2½ miles of line from Lawrence west for the Atchison, Topeka & Santa Fe Ry.,

The First "Waterproof" Roadway.

Asphalt pavements for streets were used in Paris as early as 1854, but there has always been more or less doubt as to when asphalt was first used in connection with highway construction. In a recent discussion of a paper before the Engineers' Club of Philadelphia Mr. T. Hugh Boorman stated that the first waterproofing application to an ordinary road was probably made in 1849 at the village of Travers in Switzerland. The discovery was made by accident: pieces of asphalt rock falling from carts traveling between the mines and the mastic works compressed under the wheels and produced a road surface so serviceable that it led to the construction of a macadam road of crude rock asphalt compacted with a roller, under the superintendence of Mr. Merian, a Swiss Engineer. This road was investigated in 1866 and found then to be in comparatively good condition. In the discussion of the same paper Mr. W. H. Fulweiler stated that he had found records that lead him to believe that the first "waterproof" road was made in the city of Nottingham, England, about 1842-44. The manager of the gas works at that place noticed that where the tar from the hydraulic main had been carried out by hand to the tar tank, the drippings which had spilled on the cinder walk had hardened, solidifying the path into an impervious pavement. He accordingly tried this method of mixing tar and clinker on a short stretch of road in front of his office. There is no information available as to how long this road lasted, but Mr. Fulweiler stated that there was a tar road built up in New Hampshire, in practically the same way as the Nottingham walk, with tar from a gas works, which had been down for about 28 years and was still giving pretty good service.

The New York 8-Hour Law and Its Working.

New York State, as is well known, has a somewhat drastic labor law, commonly called the 8-Hour Law, which prescribes the hours of labor, rate of wages, etc., for employees of contractors engaged in work for the state (including municipal corporations and commissions). The principal provisions of the law to be observed by the contractor are summarized in The Bulletin of the General Contractors' Association as follows: The contractor must pay the prevailing rate of wages for the locality where the work in its final form is situated, erected or used; he must employ only citizens of the United States, and where laborers are employed, preference must be given to citizens of the State of New York; he must pay his employees in cash and if the contractor be a corporation, the wages must be paid weekly for work performed up to a day, six days prior to pay day; the contractor must not permit or require a laborer, workman or mechanic to work more than eight hours in any one calendar day, except in cases of extraordinary emergency caused by fire, flood, or danger to life or property; he must not pay in scrip commonly known as "Store money orders"; he must not conduct a company store, if there be one at the time selling supplies within two miles of the place where the work is located. In the Annual Report of the State Department of Labor for 1909, the Commissioner of Labor reports on the working of the law as follows: "During the year the Department received and investigated 51 allegations of violations of the provisions limiting the hours of labor to eight a day. Of this number 29 were sustained and such action taken concerning them as the law directs. In 22 cases no violation was found. To establish a violation we must obtain proper and legal evidence in the shape of sworn statements from men who have been required or permitted to work in excess of eight hours in a given calendar day or days, or an admission from a person in authority representing the contractor or official engaged in the prosecution of the work under investigation. The law is observed quite satisfactorily upon the greatest public undertaking within our state, namely, the barge canal. An occasional complaint or rumor reached us that men employed by some contractors were working more than eight hours a day, but inquiry generally developed the fact that where excess labor had been performed, the work was clearly of an emergency character, or the violation so technical and incidental as not to justify any further action on our part."

Michael Elmore.

In the passing of Michael Elmore, president of the Elmore & Hamilton Co., the contracting profession loses one of its best known members. Michael Elmore was born in 1853 and had been in the contracting business for over 30 years. In the early part of his contracting work he had much to do with the construction of many of the principal railroads of the west, including the Union Pacific, Missouri Pacific, Northern Pacific and the Oregon Short Line. In 1903 he came east and was engaged for several years in building an extension of the Western Maryland R. R. to Cumberland, Md. He afterward engaged in construction work for the Delaware & Hudson and later he laid the four tracks of the Long Island R. R. from Long Island City, N. Y., to Jamaica, N. Y. The Elmore & Hamilton Co. at present is engaged in the construction of sections 15 and 53 of the Catskill aqueduct for the Board of Water Supply of New York city. Mr. Elmore was much interested in the breeding of fine cattle and horses, and owned a large ranch in Wyoming, where he bred cattle, and the Ben-Hur stock farm in Marshall, Mo., where he kept about 150 fine harness horses. Mr. Elmore died suddenly May 11 from stomach trouble, at his home in White Plains, N. Y. He left a widow, two sons and four daughters.

Some Inspection.

An assistant engineer in the Bureau of Highways in one of the boroughs of New York city recently inspected an asphalt pavement for final acceptance just prior to the expiration of its maintenance. The contractor had put the street in what he considered to be excellent condition, but the engineer opined that "there still existed waves of sufficient magnitude to make water *hesitate*."

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARIZONA.

The El Paso & Southwestern Ry. Co. has as yet made no definite plans for its proposed extensions. Surveys for the location of a route for an extension from Benson, Ariz., to Tucson and Phœnix have been made and reports stated that construction work would be started this summer.

COLORADO.

The Denver & Rio Grande R. R. has not as yet completed its plans for the construction of double track line between Pueblo and Walsenburg, Colo.

IOWA.

P. V. Clarke, General Contractor, Weston Bldg., Clinton, Ia., has been awarded the contract for building 15 reinforced concrete bridges for the Chicago & Northwestern Ry. Four of the bridges are on the Anamosa Branch, one on the Iowa Division and 10 on the Iowa and Minnesota.

The Sioux City & Eastern Traction Co. has practically completed its organization and has negotiations now under way with a number of engineering firms, one of which will be engaged to handle the whole engineering project, make the surveys, estimate the cost of construction and equipment, and the probable earnings, and oversee the building of the line when the construction stage is reached. The route of the road has not definitely been determined, owing to the rough nature of the country through which the line must run. Several routes are in contemplation. The only towns certain to be on the line are Sioux City, Denison and Climbing Hill. As projected the line is to extend from Sioux City through Climbing Hill and other towns to Denison, Ia. The offices of the company are at 520 F. L. & T. Bldg., Sioux City, Ia., and W. L. Harding is secretary.

KANSAS.

S. Dolman & Son, Topeka, Kan., have been awarded a contract by the Atchison, Topeka & Santa Fe R. R. for the construction of new track between Lawrence and Cameron's bluff to replace the portion of their tracks damaged by the flood and ice last winter. The contract calls for the laying of three miles of new track on a straight line between Lawrence and Cameron's bluffs, on higher ground to the south of the present line, away from the possibilities of damage from the Kansas river. Dolman & Son will probably sublet a portion of the work.

KANSAS.

Plans are not fully matured yet for beginning construction work on the Wichita, Kinsley, Scott City & Denver Air Line Ry. Necessary capital for construction is now being secured and the right of way is being obtained. The general contract for the construction of the line has been let to the Air Line Construction Co., Kinsley, Kan., of which W. F. Brown, Iuka, Kan., is president. The construction company will probably build from Wichita to Kinsley, Kan., during the coming months. The construction company has not decided as yet as to subletting any of the work. The construction company may want elevating graders and track laying machine.

MARYLAND.

We are advised that the Frederick R. R. Co. is contemplating making no extensions at the present time. Press reports stated that this company was planning to extend its line from Thurmont to Emmitsburg and then on to Gettysburg. Oscar B. Coblentz, Frederick, Md., is chief engineer.

MASSACHUSETTS.

The Boston & Albany R. R., F. B. Freeman, Chief Engineer, Boston, Mass., is planning to carry out work during 1910 which will cost approximately $2,000,000. A summary of the status of this work is as follows: The new station at Worcester is already under contract. The elimination of crossings at Worcester cannot be started for quite some time yet, as they are dependent on the work which the New Haven Road has to do. The work at East Cambridge, Natick, South Framingham and Westfield, are practically all track work which is to be done by company forces. The steel work for bridges is already let to the American Bridge Co. Plans for third tracking between Greenbush and Rensselaer will probably be ready for bids from contractors in about two weeks. The tunnel work at State Line will probably be ready at the same time. The larger portion of the work will be handled by company forces, so that there is not, with the exception of the third tracking and the tunnel work, much that is large enough to ask for contracts on.

MICHIGAN.

The Bean & Jones Construction Co., Benton Harbor, Mich., as previously noted, have been awarded a contract by the Dowagiac Ry. Co. for work at Eau Claire, Berrien County, Mich. The contract includes 140,000 cu. yds. of earth excavation and 750 cu. yds. of concrete masonry. Bean & Jones will probably sublet one cut of about 40,000 cu. yds.

NEW YORK.

The Southwestern New York Traction Co. is planning to have work started June 15 on its projected 15-mile line from Bolivar to Wellsville, N. Y. Construction contracts have not been let as yet. The traction company is in the market for supplies of all kinds. C. M. Van Curen, Bolivar, N. Y., is President.

OREGON.

The Scio-Lacomb & Jordan Valley R. R., recently incorporated, has made surveys for its projected line and has construction work under way on the first four miles of it. The projected length of the line is 15 to 30 miles and $50,000 of construction capital has already been secured. A. G. Prill, Scio, Ore., is President.

PENNSYLVANIA.

James H. Corbett has 30 miles of work for the Brookville & Mahoning R. R. This is heavy work and includes five tunnels and a bridge over the Allegheny River. Mr. Frank C. Wilson, R. F. D. No. 5, New Bethlehem, Pa., has charge of all the concrete work on the Mahoning end of the contract.

The Philadelphia & Reading Ry. has awarded the contract for constructing signal bridges from Green St. to Norris St., and 17th and Indiana Sts. to the Richmond Branch, at Philadelphia, to Lewis F. Shoemaker & Co., 15th and Walnut Sts., Philadelphia, Pa.

TEXAS.

The Crosbyton-South Plains R. R. Co. has made surveys for its projected line from Crosbyton to Lubbock. The capital for construction has been secured and construction contracts will be let June or July. The projected length of this line is 120 miles. John A. Knox, Crosbyton, Tex., is Chief Engineer, and Prentiss L. Coonley, 39th St. and Stewart Ave., Chicago, Ill., is President.

Surveys will be completed about June 15 for the first section of the American Central R. R., from Miami to Vernon, Tex., a distance of 100 miles, and construction work will be started in the fall. Maj. Geo. W. Angle, Chief Engineer, Vernon, Tex., will have charge of the work, and the contract for constructing the grade and track-laying has been let to the Central Construction Co. of Mobeetie, Tex. The work will be sublet in the fall.

A company is to be organized in the near future for building a railroad from Shreveport, La., to Waco, Tex. As projected the line will extend from Shreveport to Carthage and thence to Mount Enterprise, Rush, Palestine, Fairfield, Mexia and on to Waco. Jno. C. Whitney, President Carthage Commercial Club, Carthage, Tex., is interested.

WASHINGTON.

The Coeur d'Alene & Pend Oreille Railway Co. has been organized to build two short branches of the Spokane International Ry. The work is light and very likely will be done by forces of the Spokane International Ry. The entire mileage of both branches will not exceed about 24 miles. E. G. Taber, Spokane, Wash., is Chief Engineer of the Spokane International Ry.

WISCONSIN.

The Prairie Farm & Southwestern Ry. is making good progress with the preliminaries for its proposed line. The construction contracts have not been let to any contractor and possibly the road will not be placed under contract. Farmers along the route have been liberal stock subscribers and they have all been given the opportunity to work out their subscriptions with team and men. Actual grading work in this way has already been started. J. De Wilde, Prairie Farm, Wis., is Secretary and Treasurer.

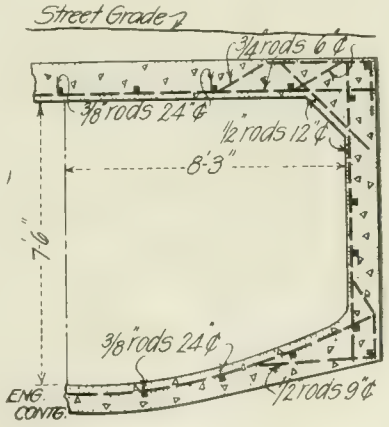
CANADA.

The Temiskaming & Northern Ontario Ry. has not as yet decided to rebuild its line from North Bay, Ont., to New Liskeard. The company has, however, made surveys to ascertain what improvements in grade and alignment it is possible to make between North Bay and New Liskeard. S. B. Clement, North Bay, Ont., is chief engineer.

Power Developments, Levees, Drainage and Irrigation Works.

CALIFORNIA.

Morve L. Weaver, City Engineer, of Visalia, Cal., has completed plans for 2,800 ft. of 16½-ft. reinforced concrete conduit, and contracts for the work will be let about June 1 to June 15. The conduit is to be constructed for the city of Visalia, the estimated cost being $83,000. The accompanying cut shows a cross section of the proposed conduit.



The Bear Valley Mutual Water Co. of Redlands, Cal., is to build by force account its Big Bear Valley Dam. The dam is to be one of the multiple arch type 85 ft. high and 327 ft. long, and is to be finished by fall. Plans for the dam were prepared by John S. East-

wood, C. E., Fresno, and it will be constructed under his direction.

FLORIDA.

The Board of Drainage Commissioners of the State of Florida, as noted in our last issue, are calling for bids until June 15, for excavating five drainage canals in the Everglades, requiring approximately 18,000,000 cu. yds. of earth excavation and 6,000,000 cu. yds. of rock excavation. The canals are to be constructed for the purpose of lowering the level of Lake Okeechobee and controlling its flood waters and for affording an outlet for draining the lands through which they pass. The canals are to be from 50 to 70 ft. wide and from 8 to 12 ft. deep, and in this excavation the contractor is to be allowed to use any kind of dredging machinery he chooses. The canals are to be completed within three years of the date of the execution of the contract. Monthly estimates are to be made and the contractor will be paid 90 per cent of the amount due each month, the remaining 10 per cent being retained by the Board until $50,000 has been reserved. The Drainage Board owns and is operating four dipper dredges, which the successful bidder will be required to take over either by purchase or lease. J. O. Wright, Tallahassee, Fla., is Chief Drainage Engineer. The accompanying tabulation shows the dimension, grade, velocity, discharge, and the approximate number of cubic yards of excavation in each section of the several canals:

No. Section.	Length in Miles.	Bottom Width.	Grade.	Velocity.	Depth of Flow.	Discharge.	Depth of Cut.	No. Cu. Yds. Excavation.

IDAHO.

The Crane Falls Power & Irrigation Co. will immediately commence construction on the feed canal and head works of its power plant at Crane Falls, on the Snake River, about 15 miles southwest of the town of Mountainhome, Idaho. The plant will have a capacity of 14,000 HP., which will be mainly used for lighting and heating purposes in the southwest portion of the state of Idaho, and in connection with pumping water for the irrigation of lands along Snake River. Contracts have been arranged with desert-land entrymen in the vicinity of Grand View, Idaho, to furnish water for about 10,000 acres; and the company's future plans include the irrigation of about 10,000 additional acres in the same neighborhood. It is expected that further plans will provide for running transmission lines into the mining regions of Northern Nevada, as electric power has long been felt to be essential to the development of the mines in that section of the country. The development is being financed by Canadian capital from Toronto and Montreal; Smith, Kerry & Chace, of the former place, being the engineers and promoters. They have opened an office at Mountainhome, Ida., the engineer in charge being G. Vansittart. The plant will be ready for operation by the first of the year.

IOWA.

Bids will be received by C. O. Dixon, Rockwell City, Ia., auditor of Calhoun County, until 1 P. M., May 23, for the construction of Joint Drain No. 70 in Webster County and Drain No. 95 in Calhoun County. The work includes the following: Sec. 1, main line: 46,400 cu. yds., 26-ft. bottom; 36,300 cu. yds., 20-ft. bottom; 38,400 cu. yds., 18-ft. bottom; 236,500 cu. yds., 12-ft. bottom; 50,900 cu. yds., 8-ft. bottom; 30,925 cu. yds., 6-ft. bottom; 58,450 cu. yds., 5-ft. bottom. Sec. 2, Branch No. 4, 102,204 cu. yds., 5-ft. bottom; Sec. 9, Branch No. 1, 23,000 cu. yds., 5-ft. bottom Work is to be commenced on or before July 1, 1910, and is to be completed on or before Jan. 1, 1912. Payments on the work are to be made as provided by the Iowa law: 80 per cent on monthly estimates; balance on completion. It is probable that bonds will be sold and the contractor on this work paid in cash. G. P. Smith, Fort Dodge, Ia., is the Engineer in charge of construction.

C. J. McElheny, Lawton, Mich., has been awarded the contract by the Commissioners of Page County for the construction of the Coin-Blanchard drainage ditch. The contract includes 233,000 cu. yds. of earth excavation. The ditch is 28,000 ft. long and is to be constructed for the purpose of straightening Tarkio Creek.

Bids are asked by R. V. Innes, county auditor, Council Bluffs, Ia., until 9 a. m., June 5, for constructing the Pigeon Creek drainage ditch, 14 miles long. The work has been divided into seven sections as follows: Section 1, 80,480 cu. yds.; section 2, 58,520 cu. yds.; section 3, 74,550 cu. yds.; section 4, 75,450 cu. yds.; section 5, 83,400 cu. yds.; section 6, 77,800 cu. yds.; section 7, 28,000 cu. yds.

LOUISIANA.

Bids will be received by N. H. Lewis, Tallulah, La., secretary 5th Louisiana Levee District, at the office of the Board of State Engineers, Room 402 Cotton Exchange Bldg., New Orleans, La., until noon, May 25, for the enlargement of the following levees in East Carroll Parish, Mississippi River, right bank. Wilson Point Levee, approximate contents, 50,000 cu. yds.; deposit required $200; bond required $2,500. Elton Levee, approximate contents, 100,000 cu. yds.; deposit required $325; bond required $5,000. Wyly to Hollybrook levee, approximate contents, 125,000 cu. yds.; deposit required, $375; bond required $6,250. Wilton levee, approximate contents, 100,000 cu. yds.; deposit required $325; bond required, $5,000. Cash or certified check to the amount named as deposit must accompany each proposal. Terms of payment, cash.

TEXAS.

Bids are asked by Robert G. Johnson, Fort Worth National Bank Bldg., Fort Worth, Tex., chairman of the Fort Worth Improvement District No. 1, until 10 a. m., June 4, for constructing levees and ditches contemplated by the district. A bond issue of $250,000 has been made for the work.

PORTO RICO.

Bids are asked by B. M. Hall, chief engineer, Porto Rico Irrigation Service, Guayama, P. R., until 2 p. m., July 25, for the construction of the Carite Dam, 150,000 cubic meters of earth and loose rock; the Toro Negro dam, 15,000 cubic meters of earth and loose rock, and the Dona Juana canal, 1⅓ miles in length. The estimated total cost is about $160,000. After May 31 plans and specifications may be obtained from the Porto Rico office or from the office of the Commissioner of the Interior, San Juan, Porto Rico, or from the Bureau of Insular Affairs, War Department, Washington, D. C. Official advertisement will be found elsewhere in this issue.

Leroy W. Baldwin, President of the Empire Trust Co., of New York City, has secured several water rights along Otter Creek, north of Middlebury, Vt., and it is believed that the power is to be developed for an electric railway projected to run north from Rutland, Vt., surveys for which were made a year or two ago.

The Seaboard Air Line R. R. is now running a line of track from Early Bird to Dunnellon, Fla., a distance of 40 miles, and is also laying rails from Dunnelton to Hernando, Fla., 14 miles out. The railroad also has under construction a line between Newberry, Fla., and Clark, Fla.

The Foshee and McGowin interests of Brewton, Ala., and Foshee, are reported to be behind the movement to build the railroad from Andalusia to Pensacola, Fla., mentioned in our last issue. It is proposed that Pensacola men secure a franchise with water front rights, a site for a depot and turn all over to the Alabama men, who in turn agree to commence work on the road within 30 days and have it completed within two years.

Paternan & Lamro have begun work at Dallas, S. Dak., on their grading contract on the Dallas-Carter extension of the Chicago & Northwestern.

Richards & Gaston, Somerville, N. J., have been awarded a contract at $18,000 for the enlargement of the Central Railroad culvert at Hampton, N. J.

The International Elevated Ry. Co. has been incorporated with a capital stock of $50,000 for the construction of an elevated railway. The incorporators are Charles Guyer, Wilmington, Del.; Geo. C. Schroeder, Washington, D. C.; S. E. Becker, Wilmington, Del.

The Chicago & Northwestern R. R. is constructing the necessary bridges between Fremont, Nebr., and Arlington for the stretch of double track. Grading was completed last Summer and all that remains to be done is the laying of 8 miles of track.

The Belle Fourche Valley Ry. Co. has filed a plat with the Secretary of State changing the location of the line east from Belle Fourche, S. Dak.

The New Orleans, Mobile & Chicago R. R., B. V. Wright, Engineer Bridges and Buildings, Laurel, Miss., has asked the city council of Mobile, Ala., for franchises over certain streets. The company is planning a number of improvements for its terminals at Mobile.

The U. S. House District of Columbia Committee has made a favorable report on the bill seeking a charter for the East Washington & Suburban Ry. Co., which is said to be ready to spend $100,000 in the construction of a railway from Anacostia along the Good Hope, Bowen and Suitland roads to the Maryland border line, connecting with a line already existing in Prince George's county. Samuel E. Cox and Wm. A. Harrison, Suitland, Md., are interested.

The Denver, Laramie & Northwestern R. R. Co. has decided to construct its line according to the original plans, from Milliken to Laramie by way of Fort Collins, Colo.

At a mass meeting of the citizens at Pueblo, Colo., it was decided to extend the time granted the Kansas-Colorado R. R. for the construction of tracks from Santa Fe Ave. to the Arkansas River and to Turkey Creek Quarries.

Reports from Aberdeen, S. Dak., are to the effect that the Chicago, Rock Island & Pacific Ry. is considering the construction of a line from Watertown, S. Dak., to Winnipeg, Man.; and a branch from a point in North Dakota through Aberdeen, to Pierre, thence through Yankton and to Omaha, Nebr., crossing the Missouri River at Yankton.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress is being made with the construction of 10 miles of levee along the Arkansas River in Saline County for the Woodson Levee District. About 80 teams and 150 men are at work. The levee will cost $53,000. W. H. Brown, Woodson, Ark., is in charge of the work.

Work has commenced on the improvement of the St. Louis & San Francisco Ry. yards at Jonesboro. The work will include considerable grading and the construction of new tracks and sheds.

The Talley Timber & Tram Co., of Marmaduke, has been incorporated with a capital stock of $10,000 and purposes to operate sawmills and to construct and operate a steam tram railway. The incorporators are: W. E. Talley, John M. Gale and A. E. Bandol.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Marysville & Colusa Ry. Co., has been organized with a capital stock of $1,500,000, of which $30,000 has been subscribed for the purpose of building an electric railroad from Marysville through Yuba City to Colusa, a distance of 30 miles. The new road will be a branch of the Northern Electric Ry. The incorporators include the following: Charles H. Hammon, Leon De Sabla, Samuel Lilienthal, San Francisco; George E. Springer, Piedmont; and Herbert W. Furlong, Pleasanton.

The Oakland Traction Co., Oakland, is planning to extend its Diamond car line through to Allendale and beyond to connect with the Mills College Line.

The Chino Land Water Co., has work underway at Chino on a new dam and reservoir. The reservoir will hold 45,000,000 gallons of water, which will be utilized in irrigating a large tract of land along the country road.

D. Donnegan, Los Angeles, has been awarded a contract at $8,850 by the Supervisors for grading approaches to a new bridge over the Tejunga Wash.

The Middle Yuba Hydro-Electric Power Co. is to begin operations shortly on its power scheme on the Middle Yuba below Graniteville. Flumes, ditches and reservoirs will be constructed, and also a power house. The company will supply Alleghany with light and power.

W. L. Courtright has applied to the town trustees of San Rafael for a franchise for an electric railway in 4th St. as far as the town limits toward San Anselmo. This is thought to be the initial step for building a line from San Rafael to Ross Valley towns.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Golden has granted a franchise to Rees C. Vidler to operate an electric railway on certain streets. This is part of a plan to operate an electric railroad from Golden to the foot of Lookout mountain, from which point a funicular line is to be built to the summit.

D. D. Morgan has been awarded the contract for grading and bridge building for the last ten miles of the Laramie, Hahns Peak & Pacific R. R. at Hebron.

Preliminary surveys have been completed for a railroad from Hotchkiss to the Crawford and Maher Districts, and to Red Canon. The line will be 30 miles in length and will develop deposits of almost pure gypsum in Red Canon. About $30,000 worth of stock has been subscribed in Crawford and the promoters state that as soon as $125,000 in stock is sold, work will be started. N. J. Olson, and George C. Harper, of Minneapolis, Minn., are promoting the project.

John A. McDowell Construction Co., has begun work at Lamar on its contract for constructing the first 15 miles of the Denver & Gulf R. R.

The Golden Cycle Mining Co., John T. Milliken, President, Colorado Springs, according to reports, is to build an aerial tram between the mill at Colorado City and the Golden Cycle mine in the Cripple Creek District. It will cost about $300,000.

The Santa Fe railroad officials have made arrangements for the improvement of the lines between Denver, Colo., and Pueblo. The work will include the construction of a number of new sidings and the straightening of the present track and is estimated to cost $1,000,000. F. M. Bisbee, La Junta, Colo., is Engineer Western Mines.

City Council of Paonia, Colo., is considering asking for bids for the construction of a concrete reservoir with a capacity of 1,000,000.

Joe Baum, Lamar, Colo., has been employed by the Two Buttes & Irrigation Co. to superintend the construction of their dam.

The Independent Construction Co., of Denver, has been incorporated with a capital stock of $50,000, the incorporators being Frank F. Cummings, Franklin T. White and E. George.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Caldwell Traction Co., of Caldwell, Idaho, has been incorporated with a capital stock of $250,000, of which $75,000 has been subscribed. The company has been formed for the purpose of making improvements to the present interurban line owned by W. R. Setree, Caldwell, who is the principal incorporator of the new company.

The Northwestern Engineering Co., Emmett, has begun work on its grading contract for extending the Payette Valley R. R. from New Plymouth to Emmett, a distance of 22 miles. Camp and commissary have been established at New Plymouth. Grading will be completed in 60 days.

Officials of the Oregon Short Line Ry. have definitely approved a new line to extend from Saline, on the main line of the Southern Pacific System, to Burley, Idaho, a distance of 175 miles. This line will shorten the distance between Salt Lake and Portland and other Oregon points fully 75 miles.

The Idaho Northern Ry., J. M. Clark, Chief Engineer, Nampa, Idaho, has filed in the U. S. Land Office at Boise a definite location map of the first section of the extension of the road from Emmett along the main channel of the Payette River to Horseshoe Bend, a distance of 25.07 miles. Actual construction work on this extension is to start just as soon as the plat for the extension can be approved by the department of the interior.

The Gilmore & Pittsburg R. R., now under construction to Salmon City, has completed surveys from that point to Lewiston, Idaho, a distance of 300 miles. This survey was started in May, 1909. In the passage from Salmon City to the mouth of the Salmon River, a distance of 260 miles, the river is crossed 13 times and four tunnels, ranging from 1,000 to 5,000 feet, have been located. T. H. Bacon, Machesney Bldg., Pittsburg, Pa., is Chief Engineer.

Nowlin & Sewell, Suburban Railroad promoters have returned to Idaho Falls, Ida., from a trip over the proposed route of railroad from this city east three miles, where a branch will run south through Ammon, Taylor, and Goshen and north branch will run through Lincoln, Iona, Willow Creek, Lorin, Popular and thence through to Heise's Springs.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Joliet and Southern Traction Co., H. A. Fisher, President, Joliet, has been securing property consents along Bluff Street at Joliet, between McDonough and Ruby Sts., with the intention of laying tracks along that street to connect its Rockdale line with its proposed line to Chicago, which will run north on the west side of the river from the end of the Ruby Street bridge. The new plan of the company is to build a new bridge across the river at Van Buren Street and run its cars from the present depot west to Bluff street and then turn south to Rockdale or north for Chicago.

The Caldwell Construction Co., of Chicago, has been incorporated with a capital stock of $10,000, and will engage in an engineering, contracting and construction business. The incorporators are Samuel W. Norton, R. Olmstead and Samuel Rothbum.

The W. H. Schott Co., of Chicago, has been incorporated with a capital stock of $2,500, and will engage in an engineering and construction business. The incorporators are James T. Jarrell, E. M. Claussen and A. M. Hayes.

The Chicago, Peoria & St. Louis Ry., W. A. O'Brien, Chief Engineer Maintenance of Way, Springfield, is to spend about $50,000 in track improvements during the present summer. Track sidings to the value of $10,000 will be constructed at Stohrs, Forest City, Oakford and Hop Hollow.

The Chicago & Northwestern Ry. is to move its yards, round house, turntable and freight depot at Barrington to a point west of the town.

The Chicago, Milwaukee & St. Paul Ry., D. J. Whittemore, Chief Engineer, Chicago, is to elevate its Bloomington Ave. tracks at Chicago, from Ashland to North Lawndale Avs., a distance of 2½ miles. The improvement, which has been agitated for ten years, will cost $1,500,000.

According to an announcement recently made at Monmouth, Ill., by the Rock Island & Southern Superintendent, all construction work will be completed between Rock Island and Monmouth by June 1.

Williams & Co., railroad contractors of Sterling, Ill., are reported to have a contract for the grading necessary for the Chicago & Northwestern yards at Fulton, Ill. It is estimated that the contract will involve about 200,000 cu. yds. of dirt. It is expected the company will put about 40 or 50 teams on the job and employ about 75 men.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wabash & Northern Ry. Co., which projects an interurban line from Wabash to Fort Wayne, is stated to have been financed and proposes to have construction work started by July 1. J. A. Berry, Fort Wayne, Ind., is the promoter.

A company headed by Robert Wood, of Chicago, Ill., has applied to the Commissioners of Clinton County for a franchise to build an electric railroad from Logansport to Burlington in Carroll County, and then on by the way of Michigantown to Frankfort, the road to follow the old Michigan road to Michigantown and then alongside to right-of-way of the Clover Leaf to Logansport. The company promises to begin work on the road within two years or to forfeit the franchise. The aim of the new company is to connect with the Kokomo, Frankfort & Terre Haute line.

The Vincennes, Washington & Eastern Traction Co., of Washington, has been incorporated with a capital stock of $100,000 and proposes to construct and operate an inter-

urban line connecting Vincennes, Washington and Loogootee. The directors are: L. Ebner, A. F. Cabel, S. C. Eskridge, A. J. Padgett, J. B. Seal and E. J. Binford.

The Indianapolis, Columbus & Southern Traction Co., is reported to be planning to extend its line from Seymour to Bedford, passing through Brownstown.

Surveys have been started for the Wabash and Patoka levee which is to extend from Oakland City, in Gibson County, to New Harmony in Posey County. The levee will be built under the direction of the Commissioners of the counties named. It will cost about $325,000.

The Foster-Raiser Construction Co., of Union City, has started work on the construction of a reservoir for the city of Boonville.

Engineers of the Cleveland, Cincinnati, Chicago & St. Louis Ry. are making surveys for the construction of the proposed double track between Muncie and Anderson, Ind. C. W. Heuss, Indianapolis, Ind., is Engineer Maintenance of Way.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Clubs of Logan and Magnolia have appointed committees to consider the matter of building an interurban line between the two cities. It is proposed to build the line with local capital. F. D. Stevens, Logan, is secretary of the Commercial Club of that city.

Bowen & Son, Nashua, Ia., have the contract for constructing a concrete dam on the Cedar River near Waverly. The dam will be 14 ft. high and several hundred feet long.

The Union Mills Co., 2 Cedar Falls is planning to make improvements to its dams and buildings at Cedar Falls and Waterloo.

L. J. Highland, of Chicago, has been making surveys on the Iowa River near Columbus Junction for the purpose of constructing a dam to develop power there. The Commercial Association of Columbus Junction, has been promoting the project.

Forrestal & Downey, Milwaukee, Wis., have been awarded the contract at 7.97 cts. per cu. yd. for straightening Keg Creek between Glenwood and Mineola. The ditch will be eight miles long and will cost about $40,000.

Arrangements are being made for the construction of the Dakota & Kansas Southern R. R., from Sioux Falls, S. Dak., to Sioux City, Ia. Surveyors will, it is said, be in the field soon to outline the permanent survey. Fred Myern, Chicago, Ill., is interested.

Rumors are afloat in the vicinity of Mason City, Ia., that the Chicago, Rock Island & Pacific Ry. Co. is considering the construction of the line from Rockford to Mason City and on through Clear Lake to Forest City to connect the western division of the road with the line from the Twin Cities.

Advices from Waukon, Ia., state that the Missouri Iron Co. is purchasing right of way for the construction of a railroad from that place to the iron mines.

The Wabash R. R. is planning improvements at Moulton, Ia. A 5-acre tract of land was donated by the town and a 16-stall concrete roundhouse will be constructed, together with additional track. The work is estimated to necessitate an expenditure of $50,000.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas District Court has decided in favor of the Shawnee County Commissioners, of Topeka, in making assessments on the proposed dike on the south side of the Kaw River. The dike will cost about $125,000.

Farmers near Muscotah in Jackson County, have organized a drainage district and propose to straighten Straight Creek to prevent the flooding of lands. It is proposed to cut out the turns for six miles, shortening the creek to 2½ miles. W. S. Gearhart, State Highway Engineer, Manhattan, Kan., is to make surveys, plans, and estimates.

The city of Topeka is to build a new levee around the Union Pacific trestle in North Topeka.

The Westinghouse, Church, Kerr & Co., Pittsburg, Pa., will start work at once on their contract for constructing the Kansas City, Mexico & Orient Ry. shops at Wichita, Kan. V. E. Stolbrand is superintendent of the construction company.

Ordinance has been introduced into the meeting of the City Commissioners providing for the construction of the Chicago, Great Western Ry., into the city of Leavenworth, Kan., from the east end of the Terminal bridge to the Missouri Pacific tracks at Short St. It is said that the Chicago, Great Western Ry. Co. is planning the construction of a $40,000 station at this place.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Steps are being taken by the business men of Owenton and Frankfort, Ky., to form a preliminary organization to have surveys made for an electric railway between the two cities. Col. Charles E. Hage, Frankfort, Ky., is interested.

The Clarksburg & Weston Traction Co., of Clarksburg, W. Va., has been chartered and proposes to build an extention of the Fairmont & Clarksburg Traction Co., from Clarksburg to Weston, a distance of about 24 miles, at a cost of about $750,000. The new company will be financed by the Fairmont & Clarksburg Traction Co.

The City Council of Covington has granted a right-of-way through this city to the Covington, Big Bone & Carrollton Traction Co. Work on the line is to be started soon.

The Baltimore & Ohio Southwestern R. R., J. B. Carothers, Chief Engineer Maintenance of Way, Cincinnati, O., according to reports, is to expend $300,000 for improving its terminal facility at Louisville.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work is to be started on the projected Natchitoches & Southwestern Ry., which proposes line between Natchitoches, La., and Colfax. Surveys for the line were made some time ago. Charles Teal, Colfax, La., as mentioned in our last issue, is interested in this road.

The Kansas City Southern Ry., R. H. Gaines, assistant engineer, Mansfield, La., is said to have had surveys made from Leesville to Alexandria for a part of its proposed route into New Orleans.

The Algiers Railway & Light Co., of Algiers, La., is about to have work started on the extension of its line in Algiers and vicinity.

Steps are being taken to form a drainage district, comprising Concordia, Tensas, Madison and East Carroll Parishes. It is proposed to issue $1,000,000 of bonds, the proceeds to be expended for draining the lands. Jeff B. Snyder, Tallulah, La., is Chairman of the Committee.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ann Arbor R. R., has offered to extend its line seven miles to New Lathrop, provided a bonus of $15,000 is raised. Jos. Wanbecq, Toledo, O., is Resident Engineer.

The Detroit United Rys. Co. is said to be considering the construction of a line from Muskegon to Flint, via Bailey, Belding and Owosso.

Plans have been formulated by the Grand Rapids & Indiana Ry. Co., for the improvement of terminals at Grand Rapids, Kalamazoo and Cadillac. The work will, it is estimated, cost about $3,000,000. E. H. Barnes, Grand Rapids, Mich., is Chief Engineer.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The County Commissioners at Minneapolis have awarded the contract for cutting the canal which will join Forest lake with the west arm of Lake Minnetonka to J. R. Johnson, for about $1,800.

The Duluth, Missabe & Northern Ry., H. L. Dresser, Chief Engineer, Duluth, Minn., has had surveys made for a cutoff south of London station, which will do away with the Clark Hill grade. The cutoff will commence at a point just south of the Gooseberry river and come out at a point near Alger Station on the Duluth & Iron Range Ry. It is said that the work will be done this summer.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. Co., has filed articles with the Secretary of State of North Dakota providing for the construction of a 130-mile line from Drake in McHenry County and through Pierce, Benson, Ramsey, Grand Forks and Walsh counties, to Medford on the Thief River Falls, Minn., line.

Material is arriving at Barnesville, Minn., for the improvement of the Great Northern Ry. Company's line between Grand Forks, N. Dak., and Barnesville, Minn. All 75-lb. rails will be replaced with 90-lb. steel, involving an expenditure of about $1,000,000.

Duluth and the Ranges.

BY PETER E. MEAGHER.

Bernard S. Andrus, representing R. S. Blome Co., paving contractors, was a caller at this office recently. They were awarded a short while ago a paving job by the City of Eveleth, Minn., and the City of Grand Forks, N. Dak., and will start on the same immediately.

Pastoret & Lawrence, Contractors, were callers a few days ago, and purchased some new equipment for the various contracts they have under way at the present time.

Diffor & Riches, contractors, Superior, Wis., were awarded a contract for paving by that city, and have already started on the same.

The Foundation Co. of New York were awarded a contract for the sinking of a concrete shaft, by T. J. Walsh of Duluth, and have already started on the same. This shaft is to be constructed for the purpose of taking out ore from an iron mine.

John Runquist, railroad contractor, is quite busy at the present time. Besides several small contracts, he is working one shovel on the Duluth, Missabe Northern Ry.

C. J. A. Morris of Morris & Shepard, Contractors, St. Paul, was a caller at this office recently. He was up here looking over the several large dock contracts that they have here and at Superior, and said they were all in very good shape. He left here for his work on the Great Northern Railroad in North Dakota, where they are constructing about 145 miles of railroad for that company. He said the work was progressing out there in elegant shape, but they still could use two or three more good team contractors, preferring those who have grading machines.

Peterson & Holm were awarded a street paving contract by the City of Superior, Wis., and have already started on the same.

Eugene Fogg, General Superintendent for Petersen & Fell, boarding contractors, was a caller and said that they were very busy, and had a great many boarding outfits working, and that they looked forward to a very successful season in their line.

The Russell Construction Co. of Superior, Wis., were the successful bidders for a concrete curbing contract awarded by the city of Superior.

F. E. Paterson, representing the Brown Hoisting Machine Co., was a visitor at this office a few days ago. They have a sub-contract for the erection of the machinery to be used on the new Pittsburg Coal Dock at Duluth. C. J. A. Morris is the chief consulting engineer for this work.

Patrick McDonnell, the Duluth Contractor, came home for a day or two recently. He is very busy on the large sewer contract at Grand Forks, N. Dak., and is spending most of his time there.

The labor situation in Duluth is in a very good condition at the present time. There is a large demand for laborers, and there seems to

be about just enough men to fill the positions offered. However, as the season progresses, we look forward to a scarcity of laborers.

Contractors and others interested in the labor and equipment lines are invited to make the offices of Peter E. Meagher, 409 West Michigan St., Duluth, Minn., their headquarters when in this city. We are always glad to answer any correspondence pertaining to the contracting business in general in this vicinity.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys were started at St. Charles, Ill., early in May by W. W. Cauthorn, Chief Engineer of the Kansas City, St. Louis Electric Ry. Co. The survey will pass through Elm Point, St. Peters, St. Paul and strike the Lincoln County line at Old Monroe. Another corps of engineers started a survey from Warrenton, Warren County, and the two will join their surveys in Lincoln County. The company, as previously mentioned in these columns, has been organized for seven years and Eastern capital has lately been pledged for the enterprise. The direct line will pass through St. Charles, Lincoln, Warren, Montgomery, Callaway, Boone, Howard, Charlton, Carroll, Ray and Clay counties. There will be several branch lines, or feeders, in Northern Missouri counties.

Frederick Essen of St. Louis, Mo., acting for the promoters of the proposed electric railway for Olive St. at St. Louis has closed a deal with an engineering company whereby the latter will build the road. The new road will be fourteen miles long and will extend from Etzel Ave. and Hodiamont tracks along Olive Street road to both Creve Coeur lakes, each of which will be reached by branch tracks. The line will cost about $210,000.

Contracts for rails for the interurban line to be built from St. Joseph to Savannah, have been closed; and contracts for grading and tracklaying are said to be pending. The St. Joseph & Savannah Construction Co. has been organized to have general charge of the work. J. H. Van Brunt, St. Joseph, is Manager.

H. G. Horton, City Engineer, Springfield, has begun a resurvey of the Jordan Creek through the Jordan Valley at Springfield, preparatory to straightening the creek and cleaning it of rubbish and dirt.

Business men of Kirksville have engaged engineers to report on the development of power from the Chariton River. It is proposed to construct a dam which will furnish the power to pump the water six miles and to light the streets of Kirksville. It is estimated that such a power plant will cost $75,000 to $100,000.

The City Council of St. Louis has passed the bill requiring the Missouri Pacific, Wabash, Frisco and Terminal railroads to abolish the Compton Ave. grade crossing at St. Louis at their own expense. It places all the cost of construction and abutting property damages on the railroads, and requires that work begin in six months. The viaduct is to cost $400,000.

A bill has been introduced in the City Council of St. Louis to create a city plan commission, composed of 16 citizens and five city officials, and appropriating $25,000 for the work. The city officials are to be the presidents of the Council and the Board of Public Improvements, the speaker of the House of Delegates and the street and park commissioners. All are to serve without salaries, but the commission is permitted to employ legal, engineering, architectural and other counsel, and clerical help. It must finish its report by January 1, 1912. The purpose of the commission, as outlined in the bill, is to prepare a comprehensive city plan, after investigating the city's physical condition. The city plan is to cover river front improvements, extension of streets, opening of new sub-divisions, beautification of the Union Station vicinity, rapid transit, extension of car lines, playgrounds, parks, boulevard systems and grouping of public buildings.

Bills are to be introduced into the Municipal Assembly providing for the abolishment of all important grade crossings in St. Louis, Mo.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Milwaukee & Puget Sound Ry. Co., has filed first agreements for right-of-way for a line to be constructed from Musselshell, Mont., to Great Falls, a distance of about 200 miles.

The construction of an electric railway between Butte and Anaconda by way of Gregson Springs is reported under consideration, and the promoters are said to have already secured options on the Anaconda street railway and equipment and on Gregson Springs. I. A. Heilbronner, Main and Granite Sts., Butte Mont., and Charles F. Kelly, Butte, Mont., are reported to be interested.

The Great Northern Ry., A. H. Hogeland, Chief Engineer, St. Paul, Minn., has begun condemnation suits for right of way, and announcement has been made that the proposed 350 mile extension from Haucks, Mont., to Mondah will be constructed at once.

E. J. Anderson, White Sulphur Spring, Mont., is in receipt of information stating that a deal has been completed whereby a railroad will be constructed from Dorsey to the Springs. Work will be started, it is said, within a month.

Reports state that Donald McIntosh will start work soon on his contract for the construction of the Chicago, Milwaukee & Puget Sound cutoff from Lewistown to Melstone, and that the outfit will be in Lewistown, Mont., within 30 days.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Utica & Mohawk Valley R. R. Co., C. Loomis Allen, General Manager, Utica, is considering constructing this season a number of extensions to its trolley lines at Rome.

Residents of the towns of Cicero and Hastings have petitioned the Syracuse & South Bay Electric R. R. Co., Syracuse, to extend its lines from North Syracuse through Cicero village and Brewerton, to Central Square, in Oswego County.

The project for constructing a railroad from Deposit to Trout Creek, a distance of 17 miles has been revived, and it is believed that something will be done toward building the road. The Delaware & Southern R. R. Co., which proposes to build this line was incorporated five years ago to build the road, but nothing was done further than to secure authority to issue a mortgage on $400,000 and to obtain a certificate of necessity. George H. Perigo, Scranton, Pa., is interested.

The Business Men's Association, of Geneseo, has appointed a committee, of which E. Everett Doty is chairman, to consider the advisability of building a trolley line to connect the village with the Erie R. R. depot, which is located about one mile from the center of the town.

The G. B. Montgomery Co., of New York City, has been incorporated with a capital stock of $50,000, and will engage in general construction work, building bridges, railroads, etc. Geo. B. Montgomery, 1030 Hoe Ave., New York City, is principal incorporator.

The Elmira, Corning & Waverly Traction Co. of Elmira, has now practically secured all rights of way for the proposed extension of its line from Elmira to Corning, and it is expected that active work in construction of the line will begin soon.

A resolution is before the State Legislature to permit the New York & Canadian Pacific R. R. Co., of which Verplanck Colvin of Albany is the head, to continue and complete the construction of its proposed new standard gage steam railway, extending across the state from New York City to the Canadian line.

The State Public Service Commission has granted an extension of one year to the Hudson & Manhattan Railroad Co. (the McAdoo tunnels) for the completion of the subway in Sixth Ave. from 23rd to 33rd St., New York City. The time would have expired June 15. The extension also applies to the building of the spur under Ninth St. to Fourth Ave.

The Bayonne Subway & Development Co. has been formed at Port Richmond (L. I.), N. Y., for the purpose of having a tunnel built under the Kill von Kull from Bayonne, N. J., to Port Richmond. This tunnel, according to the plans of the promoters, is to connect with the Hudson tunnels and a system of electric roads on Staten Island. According to estimates the subway could be built for $600,000.

Officials of the Delaware & Eastern Ry., which is now in the hands of receivers, have been over the route, making an examination to ascertain whether the making of additional improvements will put the road on a paying basis. It is believed that these improvements will be made. O. F. Wagenhoist, Margaretville, N. Y., is General Superintendent.

Hearing is to be held June 8 on the petition filed by the Boston & Albany R. R., to condemn land in Richmond and Hinsdale for right of way to lay a third track.

Hearings are again being held by the Public Service Commission on the construction of the Buffalo, Rochester & Eastern R. R. Co. double track line from Buffalo to Troy. If permission is given to construct the road terminals will be constructed at a point north of the West Albany yard on the New York Central with a capacity of 3,030 cars and between Troy and Albany, with a capacity of 360 cars.

Chamber of Commerce of Syracuse, N. Y., is to take active steps toward securing the construction of branches from the Lehigh Valley and the New York, Ontario & Western R. R.'s to that place. The former is 20 miles distant and the latter 18 miles from Syracuse.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Dayton, Springfield & Xenia Southern Traction Co., has completed preliminary surveys between Xenia and Washington for a proposed traction line.

The Norfolk & Western Ry., C. S. Churchill, Chief Engineer, Roanoke, Va., has secured 8½ acres of land just north of Chillicothe, which will enable the company to change the course of a creek, cut out a grade and straighten the road so that the double tracking can be proceeded with.

The City Engineer of Alliance, has completed plans for the 5th St. subway in that city, and has plans well underway for the Arch Ave. subway.

Over $182,000 of stock for the proposed New Castle & New Wilmington Ry. Co.'s line is reported to have been subscribed. According to reports J. G. White & Co., of New York City, are to build the line if $300,000 of stock is subscribed.

The Pennsylvania R. R. is said to be ready to expend $3,000,000 on Whisky Island ore docks and appliances as soon as the city of Cleveland is ready to trade land at the north end of Bank Street, needed for a switchway.

Superintendent of Parks Madden of Dayton, is considering a plan for beautifying the trend of the Miami & Erie Canal, by a system of parking. The work will cost about $3,000.

A special committee at Marshfield, of which William Voegele, Sr., is chairman, is raising a fund of $1,000 to have preliminary surveys made for an interurban line to connect Marshfield with Mt. Gilead and Delaware.

The Norfolk & Western Ry., C. F. Losh, Assistant Engineer, Portsmouth, O., will expend about $35,000 for an underground crossing at Haverhill. The crossing will be 24 feet inside and 30 feet from the abutments. It is also proposed to make a 16-foot road, of stone, 15 in.

The Forest City Construction Co., of Cleveland, has been incorporated with a capital stock of $15,000, the incorporators being Harry A. Cone, Walter S. Raeder, Ferdinand A. Krauss, Gustav Shelds, G. P. Phillips.

The General Traction Development Co., of Cleveland, O., has been awarded the contract

for making surveys for the proposed electric lines from Marion to Mt. Vernon and Mt. Gilead to Mansfield and Delaware. The Roberts & Abbott Co., Cleveland, O., will make the surveys.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Final surveys have been started for the projected interurban line between Morrison and Stillwater, and it is said that grading work will be started some time this month. This is the line promoted by L. J. Lampke. F. A. Brown, 806 Main St., Stillwater, Okla., is Constructing Engineer.

The West Tulsa Belt Line Ry., of Tulsa, which has recently been granted a franchise by the commissioners of Tulsa county, is planning to have construction work started shortly. The railway as projected will extend from Le Fevre of the Texas company's station on the Midland Valley, to Lost City on the Enid division of the Frisco, a distance of nearly eight miles. It will connect the three refineries in West Tulsa and will enter the sand quarries near Lost City. Surveys have already been made.

According to a statement recently made by William Kenefick, President of the Missouri, Oklahoma & Gulf R. R., at Phoenix, Ariz., actual construction work will be started about August, 1910, on the northern extension into Kansas City. As proposed the line will pass through Joplin and Pittsburg, Kan. Headquarters of the railroad are at Kansas City, Mo.

According to advices from Tulsa in regard to the proposed line of the Kansas City Tulsa & Southwestern, construction work will be resumed within a month. All surveys have been made and bonds amounting to a sufficient sum to build from Tulsa to Joplin have been disposed of. As proposed, the line will eventually extend to Paris, Tex.

The Choctaw, Newcastle & Western R. R., which at present has three miles of line in operation, is to build 11 additional miles to form a connection between the Rock Island track near Alderson and the Missouri, Kansas & Texas road at Savanna.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to a statement at Portland, of C. M. Atkinson, President of the recently incorporated Portland, Baker City & Butte electric road, surveys will be started soon. The plan is to build from Portland through Clackamas County to the head of Warm Springs to the junction of the Deschutes River, thence eastward to Baker City.

The Coos Bay Rapid Transit Co., W. P. Evans, President, North Bend, is negotiating for franchises in Marshfield and proposes to have the work in its proposed electric railway between Marshfield and South Bend started soon.

Announcement has been made that the main line of the Oregon Railway & Navigation Co. between Pendleton and Yoakum, Ore., is to be rebuilt. The distance is 14 miles and the improvement will cost $1,000,000. G. W. Boschke, Portland, Ore., is Chief Engineer.

The Astoria Southern Ry. Co. has been incorporated with a capital stock of $500,000 and proposes the construction of a line of railroad from Astoria, along the east bank of Youngs Bay and Youngs River south to points on Nehalem Bay and Tillamook County. The incorporators are Lester W. Humphreys, Warren Thomas and Otto J. Kraemer, all of Portland, Ore.

Committee of citizens of Jacksonville, Ore., have succeeded in securing practically all right of way necessary to insure the construction of the Pacific & Eastern R. R., from Blue Ledge Mine, near Hutton, on the California Line to Jacksonville, Ore. John R. Allen is President of the railroad company, and William Gerig, Medford, Ore., is Chief Engineer.

The Fir Lumber Co., Cottage Grove, Ore., has started work, it is said, upon the construction of a logging railroad from the terminus of the Oregon & Southern three miles into the forest reserve.

According to advices from North Bend, Ore., L. D. Kinney has subscribed $250,000 toward the construction of the proposed railroad of the Lane County Asset Company from Eugene, Ore., to Coos Bay, by way of Siuslaw. It is expected that construction work will be started shortly on the line.

The Beaver Construction Company has been incorporated with principal offices at Salem, Ore., and capital stock of $25,000. The incorporators are M. E. Ingraham, G. E. Walsh and I. G. Streit.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Philadelphia & Western R. R. has applied to the West Conshohocken Town Council for a permit to lay tracks and operate cars in the borough from the western to the eastern boundaries, the route ending at the Schuylkill bridge leading to Conshohocken.

The Lehigh Coal & Navigation Co., of Mauch Chunk, will in the near future have work started on a line of railroad from Hauto to Coalport, 10 miles, to convey coal to the proposed power plant at James Run to serve as a feeder for the Lehigh Canal.

The Pittsburg & Lake Erie R. R. is said to be considering building an additional track up the Monongahela River from Pittsburg to Connellsville, making a 4-track line between those places.

The Kittanning Railroad Co. has been incorporated with a capital stock of $20,000 and proposes the construction of a railroad line 1.7 miles from the line of the Allegheny Valley Division of the Pennsylvania Railroad in Kittanning, Pa., to Montieth and Water Sts. in Wickboro. The incorporators are H. A. Colwell, J. D. Galbraith, Mont Bixler and W. V. Thorp, Kittanning; F. C. Neale, Pittsburg, Pa.

Connellsville & State Line R. R. Co. has been incorporated with a capital stock of $700,000 and proposes the construction of a line of railroad 68½ miles long from Connellsville to the Mason and Dixon line, one mile east of the boundary between Garrett and Allegheny counties, Maryland, extending through Somerset and Fayette counties. The incorporators include: W. A. Wilbur, South Bethlehem, President; G. S. Schmidt, York, Pa.; C. H. Early, W. H. Ruppel, C. F. Uhl, Jr., John N. Snyder, Josiah Swank, C. W. Walker, F. W. Biesecker, Connellsville, Pa.

As almost two-thirds of the preferred stock has been sold, the construction of the proposed line of the New Castle & New Wilmington Ry. Co. is reported to be assured.

The Juniata Valley Construction Co. has been incorporated with a capital stock of $50,000, and will engage in the construction of electric, steam and gasoline electric railroads. A. J. Starr, F. E. Seel, C. W. Fisher and B. F. Godard, all of Huntington, Pa., are interested.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Memphis & Gulf R. R. has filed its articles of incorporation at Frankfort, Ky., and proposes a line to extend from Dyersburg, Tenn., west to Memphis, and thence to St. Louis and north to Chicago, and from Dyersburg, south to Mobile, stretching across the United States from the lakes to the gulf in a direct line. The incorporators are: G. T. Weakley, John H. Watkins, 2 Wall St., New York; S. G. Latta, Dyersburg, Tenn.; E. Rice, J. C. Doyle, R. M. Hall, Charles A. Hall and W. H. Ruhe. The company now owns the Dyersburg Northern R. R., 31 miles long, which is now being operated under the name of the Chicago, Memphis & Gulf R. R.

Preliminary surveys for the proposed belt line around the city of Jackson, Tenn., have been made. The survey and estimates of costs were made by engineers of the Illinois Central R. R., and will be submitted to the other railroads entering Jackson for decisions as to whether they will finance the project.

A drainage district has been organized at Obion for the purpose of straightening the Obion River from the mouth as far as Rives, Tenn. B. E. Fletcher, Chief Engineer of the district, is now engaged in making maps and plans for this projected improvement.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Northern Texas Traction Co., H. T. Edgar, Manager, Fort Worth, has been granted permission to double track its line on three streets in Fort Worth.

The Austin Electric Ry. Co., W. J. Jones, President, Austin, Tex., is to at once extend its car lines on a number of streets in Austin.

The Wichita Falls & Northwestern Ry., R. A. Thompson, Chief Engineer, Wichita Falls, has completed extensions to Elk City, Okla. Contract is to be awarded immediately for a 20 mile extension to Hammon, north of Elk City.

The City Council of Austin is to grant a franchise to C. V. Birkhead, of San Antonio, to build and operate a street railway in South Austin. The company is to be known as the South Austin Street Ry. Co.

The East Texas Traction Co. has submitted a proposition to the Chamber of Commerce of Dallas regarding the construction of an interurban line from Dallas to Terrell. The estimated cost of the line is $1,000,000 and Dallas is required to subscribe $150,000 as its share.

The McCullough Construction Co., St. Louis, Mo., has been awarded the contract at $30,000, for constructing the roundhouse and machine shops of the Wichita Falls & Northwestern Ry. at Wichita Falls. The coal chute and turntable will be constructed by the railway, of which R. A. Thompson, Wichita Falls, is Chief Engineer.

Press reports state George W. West, Oakville, Tex., owner of a ranch of 120,000 acres in Live Oak County, has offered to give $100,000 to any one who will build a railroad through the property. At present this ranch is situated more than 25 miles from the nearest railroad shipping point. Two or three propositions are being considered for building a railroad between Beeville and Eagle Pass, passing through Mr. West's ranch, but nothing definite along this line has as yet been done.

The C. H. Sharp Contracting Co., Kansas City, Mo., has the contract for revising the grades of the Santa Fe Ry. between Temple and Coleman. An appropriation of $300,000 has been made for the work.

Preliminary work is well under way for the new pleasure pier at Port Arthur. The engineering work is being done by P. H. Harris and D. K. Miller for the pier company, and F. F. Axtel for the government, and within the next few days their reports will be submitted. G. N. Bliss, Port Arthur, is Chairman of the Building Committee.

The City Council of Port Arthur has extended the franchise of the local traction company for 20 years. The company agrees to shell both sides of its track for 5 ft. from Seventh St. on Houston Ave., to Shreveport Ave. on Proctor, a distance of ten blocks and run its line on the side of Houston Ave. instead of the center from Seventh St. on Houston Ave. to Texas refinery.

The State Railroad Commission has granted the Houston & Texas Central R. R. permission to register bonds in the sum of $2,383,000, first mortgage thirtys at 6 per cent on its Mexico-Nelleva cutoff. The application for the issuance of an additional $484,393 was also approved, the amount to be used for the completion of the road, the bonds to be issued as the improvements call for.

E. L. Lancaster, who filed a petition with the Municipal Commissioners for privilege to construct an electric interurban line in East Dallas, Tex., from Fair Grounds through Mount Auburn, is urging them to take action in the matter.

First location survey for the proposed line of Gainesville, Oklahoma & Western R. R., from the city of Gainesville, Tex., to Bridgeport, has been completed by the crew under F. B. Truax, Chief Engineer of the company.

The final survey will be started soon and upon the completion of that grading will be commenced.

The Texas, New Mexico & Pacific Ry. company has filed a blue print plat of its proposed two-mile line from Las Cruces, N. M., to Agricultural College, with Nathan Jaffa, Territorial Secretary. Charles L. Post is Chief Engineer of the railroad.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

George M. Miller of Huntington, Utah, representing the Twin Peaks Reservoir Association has filed with the United States land office an application for a right-of-way for the construction of a canal and reservoir in Emery and Carbox counties. It is proposed to construct a canal starting at Miller Creek in Carbon county, and running in a southeasterly direction through townships 15 and 16 south, range 9 east and into Emery county, to connect with the proposed reservoir. The canal it is estimated will be six miles in length and will carry the waters of Miller Creek to the reservoir. The length of the dam is given as 1,802.02 ft. and its height as 18 ft. The area of the reservoir will be 114.07 acres, and its capacity 550 acre feet.

The Snake Creek Mining & Tunnel Co. has been incorporated under the laws of Delaware with a capital stock of $1,000,000. Jesse Knight, Provo, Utah, is President and Geo. W. Lambourne, Salt Lake City, is Secretary.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An ordinance is before the City Council of Norfolk, Va., in which the Norfolk & Portsmouth Traction Co. asks a number of concessions in return for which the company proposes to build a number of extensions to its trolley service.

Surveys are now being made for the projected line of the Emporia & Ahoskie Ry., which will connect with the Atlantic Coast Line at Emporia, Va., and will cross the S. A. L. at Margarettsville, N. C., then extend on to Pendleton, Murfreesboro and Ahoskie.

It is reported directors of the Norfolk & Western R. R. are considering the advisability of running the railroad from Fries, Va., to Ballon Mine. C. S. Churchill, Roanoke, Va., is Chief Engineer of the company.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hewes Construction Co., Chicago, Ill., has started work at Chehalis, preparatory to laying the rails for the electric line that is to connect Chehalis and Centralia. Grading work is under way all along the line. J. H. Clark, Chehalis, is representative of the constructors.

The Sciele Canal Co., of Wenatchee, has been incorporated with a capital stock of $10,000, incorporators being L. P. Nurton, E. Bohlme and DeVere Utter.

Plans for the Klickitat Irrigation & Power company's canal, by which it is proposed to irrigate Horse Heaven lands in Yakima, Klickitat and Benton counties, have been filled with the United States land office at North Yakima. The length of canals covered by these filings is 42 miles. Preliminary surveys carried as far as Glade show 110 miles of canals, and the line through Benton county is additional. This means the canals will be over 200 miles long. The intake is to be slightly north of the mouth of Pearl creek, on the Klickitat river. A storage dam will be constructed there 676 feet long and 26 feet high.

The Western Construction Co., of Spokane, has been incorporated with a capital stock of $100,000, the incorporators being George W. Shaeffer, John I. Fisher and H. P. Nichols.

The Seattle Electric Co., George P. James, Chief Engineer, Seattle, has announced final plans for the electrification of the Madison St. cable line between Broadway and Madison Park, and the selection of a site for the new cable line power house which will operate the cable cars between Broadway and the water front.

The Mount Adams Ry. Co., of White Salmon has filed its articles of incorporation announcing intention of building a line of railway in Klickitat county to connect the towns of White Salmon and Glenwood in the same county. The capital stock of the company is $50,000 and the incorporators are C. L. Coburn, Tunis Wyres, Rik Field, Rudolph Lauterbach, T. F. Sheppler, A. H. Jewett and W. W. Swan.

Announcement has been made by President Suksdorf, of the proposed Columbia River & Mount Adams Railroad Co., which projects a line up the White Salmon Valley, to the effect that capital has been secured and construction is now assured.

According to a dispatch from New York, the directorate of the Chicago, Milwaukee & St. Paul R. R. has appropriated $12,000,000 for the improvement and extension of the Chicago, Milwaukee & Puget Sound in the state of Washington and to construct lines north and south in the Pacific Coast states.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Baltimore & Ohio R. R., is said to be planning to have construction work started at once on a branch line from the M. R. Division at Worthington, W. Va., up Teverbaugh to a new coal field. The branch will be several miles long and will be an expensive piece of construction.

The Baltimore & Ohio R. R., J. B. Carothers, chief engineer maintenance of way, Cincinnati, O., according to reports is to soon begin the construction of a 90,000,000 gallon reservoir at Clarksburg, W. Va., with a tunnel pipe line 50 miles long.

The Mannington & Smithfield R. R. Co., of Mannington, W. Va., has been incorporated with a capital stock of $25,000 and proposes to build a railroad from Mannington, in Marion county, to Smithfield, in Wetzel county. The incorporators include: Fred W. Bartlett, R. J. Abbaticchio and S. A. Hendrickson, all of Mannington.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Park Board of Milwaukee, Charles G. Carpenter, Superintendent, is to extend the Lake Shore drive about 600 ft. this season. This drive will be extended behind a revetment to protect it from the action of the waves.

The Chicago & Wisconsin Valley R. R., Allen T. Russell, General Manager and Chief Engineer, Chicago, Ill., will, it is stated, shortly let grading contracts for the interurban line between Portage and Madison. J. E. Jones, Portage, is Treasurer.

The Green Bay & Western R. R., J. A. Jordan, General Manager, Green Bay, Wis., is reported to be planning extensive improvements for its terminals at La Crosse.

Contract has been awarded Donald Jeffry for the construction of a section of the Chicago & Northwestern line between Tunnel City, Wis., and Raymore. Work will be started about June 1.

The Wisconsin R. R. Commission will hold hearings May 25 and 26 on the application of the Fox River Valley Co., for a certificate of convenience and necessity for the construction of the line from Cedarburg to Milwaukee, Wis.

The Milwaukee-Western Ry. Co. has secured options or purchased right of way from Sussex through the town of Lisbon and the village of Pewaukee to Waukesha and is contemplating extending its line south to Lake Geneva and ultimately to Chicago, Ill.

Wyoming Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary surveys are to be started soon, it is said, for the proposed interurban line and street railways at Sheridan, Wyo., franchises for which have been granted to Emanuel & Sullivan, of Dayton, O. W. H. Scothorn, Hutchinson, Kan., is the engineer.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Nipissing Central Ry., which recently placed in operation an electric railway from Hailesburg, Ont., to Cobalt is considering extending the line to New Liskeard. Preliminary surveys were made some time ago and applications for a franchise are now before the Village Council.

The Private Bills Committee of the Upper House of the Canadian Legislature has passed the bill giving the Montreal Street Ry. Co. general powers to build underground lines at Montreal, Que. A clause in the bill provides that the company shall spend $2,000,000 on the subway within four years.

The Canadian Pacific Ry. has acquired $100,000 worth of land in the east end of London, Ont., near Quebec St. The land will be used for shops, roundhouse, station, office buildings, etc., which will be erected on the south side of the tracks on Quebec St. The company is also arranging for a downtown station. It is also reported that the C. P. R. will acquire the London & Port Stanley Ry.

The citizens of Regina, Sask., have voted against the granting of a street railway franchise to J. W. DeC. O'Grady of Winnipeg.

Residents in the municipality of St. Francois Xavier are endeavoring to induce the Street Ry. Co. to extend the Headingly lines a distance of ten miles.

The Toronto Railway Co. has submitted to the Ontario Railway and Municipal Board for approval the following list of new street car lines the company agreed to construct in Toronto: Teraulay St., from Queen to Agnes, west across University Av.; Anderson and St. Patrick to Bathurst; Victoria St., from Adelaide to Wilton east, across the new bridge to a point east of Broadview Av.; Shuter St. from Yonge to Victoria; Harbord St., from Spadina Av. to Ossington Av.; single track on Louisa St., Teraulay to James; single track on James St., Louisa to Queen.

The Canadian Pacific Ry. is planning to begin work in June on improvements at Toronto, Ont., which will include a subway on Yonge St., a new passenger station there, and extensive freight sheds. Yonge St. will be lowered considerably, and the company's tracks raised several feet. The latter will not make the viaduct ascent and descent so steep as at first intended. The purchase of the lands and the construction of the subway will cost the company nearly $600,000 or over.

Snyder Bros., Portage La Prairie, Man., have been awarded the contract at $40,528, for building a dam on the Little Saskatchewan River at Minnedosa, Man.

The stockholders of the Lake Superior Corporation have voted favorably on the proposal to issue securities of the Algoma Central & Hudson Bay Ry., a subsidiary of the Lake Superior corporation, to the amount of about $3,500,000, to finance the completion of the railroad to a connection with the main line of the Canadian Pacific. It is planned to complete the Algoma Central railroad from Saulte Ste. Marie to Josephine Junction, and thence to Hobon, where it will connect with the Canadian Pacific. C. N. Coburn, Sault Ste. Marie, Ont., is Chief Engineer.

The O'Boyle Construction Co. has been awarded a contract for the construction of 31 miles of railroad from Hawk Lake, Ont., to Hobon, which will connect the C. P. R. and the A. C. R. The contract calls for the completion of the road within a year's time. The O'Boyle Construction Co. is now engaged on the nine-mile branch, which will connect the Josephine mine with the Magpie River. A large force of men are hurrying the work through, and its early completion is assured. The O'Boyle company is also undertaking the completion of the gap on the Manitoulin & North Shore Ry., between Espanola and Little Current, which will connect the Georgian Bay with Sudbury, Ont.

Charters and subsidies having been obtained and English and French capitalists will

soon be asked for financial support in behalf of a new railroad, the Montreal, Kapatchawan & Rupert Bay, capitalized at $3,000,000, which is designed to link Montreal with the Grand Trunk Pacific or the Transcontinental. The project will involve the construction of 194 miles of line. E. J. Reambooth, Chief Engineer, is already making surveys.

The contract for constructing Sec. No. 6 of the Trent Valley Canal has been let to the Bishop Construction Co. of Montreal and Toronto. This contract takes in the section of about four miles from Crowe Bay to Healy Falls, the "missing link" of navigation from Campbellford to Georgian Bay.

The Canadian Pacific Ry. is reported to have purchased control of the Dominion Atlantic Ry. from Halifax to Yarmouth, N. S., together with the Midland branch between Windsor and Truro. In addition to reaching Halifax the C. P. R. has had in contemplation for some time the pushing of its line east to Sydney and Louisburg and the acquisition of the D. A. R. is believed to be preliminary to undertaking such an extension.

Jacobs, Davis & Forgie, Consulting Engineers, New York City, have been retained by the city of Toronto to prepare a preliminary report on subways in Toronto. City Engineer Rust of Toronto has estimated the cost of a subway on Yonge St. from Front St. to a point 500 ft. south of St. Clair Ave., at $1,400,000 per mile, or a total of $4,017,000. This does not include land damages, which, it is thought, will not be heavy. The equipment will cost about $300,000, and the maintenance $60,000 per year. The surface lines to be constructed in connection with the subway will cost $70,000 per mile.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Mexico, Northwestern Ry., B. H. Bryant, Chief Engineer, Casas Grandes, Chihuahua, Mexico, is to have work started at once on its projected branch mentioned in our last issue. The branch is to run from San Antonio on the main line running west from Chihuahua to the town of Cusihuiriachic. The length of this branch will be 24 kilometers.

The National Railways of Mexico have placed an order with the Campania Industrial de Michoacan for 12,000,000 cross ties, to be delivered during the next ten years.

The Mexican Ry., Walter Morcorn, General Manager, City of Mexico, has assumed control of the mule traction line between Santa Ana Chiautempan and Tlaxcala, recently purchased by the Mexican Railway Co., from the estate of Mariano Fortuno. The line will probably be converted to steam traction and will probably be extended.

Over 1,200 men are now engaged in the construction of the first 50 kilometers of the Durango-Llano Grande Ry., which will be constructed to extend 100 kilometers west of the terminus of the International into the dense forest regions. The first half of this work will be done by the Compania Bancaria de Fomento y Bienes Raices de Mexico, S. A. of the City of Mexico. The second half will be done by Jack Phillips. F. V. Lister, of F. V. Lister & Co., City of Mexico, will manage the construction work on the railway.

Surveys have been started from Gulfport, Miss., for the new interurban railway from McComb to Godbold Mineral Wells, via Summit. J. E. Randall, of Gulfport, Miss., is the contractor in charge of the work, and S. D. Wilkinson, Gloster, Miss., is the engineer.

Advices from Pingree, N. Dak., state that actual construction work has been started upon the Pingree-Wilton extension of the Northern Pacific Railroad, and grading is well under way.

Two preliminary surveys have been made by Mark B. Kerr, Consulting Engineer for the proposed route of the Mono Lake railroad, in Nevada. It is planned to make a connection somewhere with the Tonopah & Goldfield line.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Denver, Colo.—Until noon, May 28, by Charles W. Comstock, State Engineer, for the construction of a steel bridge across the Grand River near Lacy in Garfield County, Colo.

Highland Park, Ill.—Until 8 p. m., June 7, by City Council, for furnishing all labor and material necessary for the construction of 6 reinforced concrete girder type bridges. H. L. Bowen is Commissioner of Public Works. Official advertisement of the work will be found elsewhere in this issue.

Hammond, Ind.—Until noon, June 6, by Board of County Commissioners, for the construction of a steel bridge over the Grand Calumet River. Charles Johnson is Auditor of Lake County, Indiana.

Madison, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction and repair of bridges. G. F. Crozier is Auditor of Jefferson County.

Shelbyville, Ind.—Until 10 a. m., June 7, by County Commissioners for the construction of bridges and bridge repairs in Shelby County. G. W. Huntington is Auditor.

Farmington, Mo.—Until 1 p. m., June 7, by Thos. H. Holman, County Highway Engineer, for the construction of four steel bridges.

St. Louis, Mo.—Until June 21, by Board of Public Improvements, for the construction of foundations and concrete work for concrete viaduct with necessary approaches on Kings highway from Manchester Ave. to McRee Ave. Mazime Reber is President. Official advertisement of the work will be found elsewhere in this issue.

New York, N. Y. Until 3 p. m., May 26, by Park Board, Borough of Manhattan, New York City, for all labor and materials required for repairs to Washington Arch in Washington Square, Borough of Manhattan.

Smithfield, N. C.—Until June 6, by Sam T. Honeycutt, clerk County Commissioners, for the erection of iron bridge.

Dayton, O.—Until noon, May 25, by Department of Public Service, for the construction of a concrete steel bridge, Melan System, over Great Miami River at Stewart Street. The structure will consist of 7 86-ft. span arches; with 40 ft. roadway and 9-ft. sidewalks. F. J. Cellarius is city engineer.

Dayton, O.—Until noon, May 25, by William A. Budroe, Secretary, Public Service Department, for the construction of a new bridge at Stewart St. The estimated cost of the structure is $170,000. It will be 650 ft. long and will consist of 7 steel and concrete spans.

Troy, O.—Until 10 a. m., June 8, by County Auditor, A. E. Sinks, for the construction and material of the substructures of the following bridges: Bridge over the Miami River, one mile east of Tippecanoe City, O.; the Broadford bridge, over the Miami River, east of Troy, O.; the Short Street bridge, over the Miami and Erie Canal, Troy, O.

Warren, O.—Until May 23, by County Commissioners, for the construction of a bridge over Yankee Run on East Liberty St., in Hubbard. Fred T. Stone is County Auditor.

Warren, O.—Until 1 p. m., June 6, by Board of County Commissioners for the necessary labor and material for the construction of the superstructure of a bridge over Grand River about 1½ miles east of West Farmington. Fred Stone is Auditor of Trumbull County.

Lincoln, Neb.—Until 2 p. m., June 2, by H. E. Wells, County Clerk, for the construction of all bridges ordered in Lancaster County, Neb., for one year from date of contract.

Fort Sill, Okla.—Until 10 a. m., June 10, by Capt. David L. Stone, U. S. A., Constructing Quartermaster, for steel highway bridge across Cache Creek.

Lexington, S. C.—Until May 21, by County Commissioners for the construction of a steel bridge over the Saluda River at Wyse's Ferry, about 6 miles from this city.

St. Marys, W. Va.—Until 2 p. m., May 26, by R. L. Griffin, County Court Clerk, for the erection of the steel work and masonry for the proposed new wagon bridge over Middle Island Creek at Arvilla.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Birmingham, Ala.—Until noon, June 1, by Board of Education, for furnishing and installing three steam-heated mechanical blast heating and ventilating plants in public schools in Birmingham, Ala.

Crown Point, Ind.—Until 10 a. m., June 7, by County Commissioners, for the steel fixtures for the court house building at Hammond, Ind. C. A. Johnson is Auditor of Lake County.

New York, N. Y.—Until 11 a. m., June 11, by Bureau of Yards and Docks, R. C. Holcomb, chief, Washington, D. C., for an addition to female nurses' quarters at the U. S. Naval Hospital, New York, N. Y.

Plattsburg Barracks, N. Y.—Until 10 a. m., June 9, by Capt. Edward T. Hartmann, Constructing Quartermaster, Plattsburg Barracks, N. Y., for the construction of four sets of officers' quarters at Plattsburg Barracks, N. Y.

Whipple Barracks, Ariz.—Until 3 p. m., May 31, by Lieut. G. G. Bartlett, Constructing Quartermaster, for furnishing labor and material for the construction of quartermasters' storehouse at Whipple Barracks.

Washington, D. C.—Until 11 a. m., August 25, by Col. F. L. Denny, Quartermaster, U. S. Marine Corps, Washington, D. C., for the erection of a marine barracks, officers' houses and servants' quarters at the naval station, Pearl Harbor, T. H.

Columbus, Ind.—Until 3 p. m., June 20, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Columbus, Ind.

Fort Des Moines, Ia.—Until 3 p. m., May 25, by Constructing Quartermaster, Fort Des Moines, Ia., for the construction of one fire apparatus building, one quartermaster stable, one hay shed, one coal shed and one shop building, including plumbing, electric wiring and fixtures.

Fulton, Mo.—Until 4 p. m., June 1, by Board of Managers State Hospital No. 1, for the general work of building a hospital building, including excavation, concrete, reinforced concrete, constructional and ornamental iron, brick work, plastering, mill work and glass, painting, cut stone, terra cotta, etc.

Holdredge, Neb.—Until June 13, by Board of County Supervisors, for the construction of a county court house building at this place. James McClymont is Chairman and C. L. Hedlund is County Clerk.

Fort Bayard, N. Mex.—Until 11 a. m., May 28, by Lieut. C. C. Winnia, Constructing Quartermaster, for the construction, plumbing, heating, electric wiring and electric light fixtures for one set of field officers' quarters.

Fort Meade, S. Dak.—Until 10 a. m., May 28, by Constructing Quartermaster, Fort Meade, S. Dak., for the construction of four double buildings for stable guard and shops, including electric wiring and fixtures.

Fort Sam Houston, Tex.—Until 11 a. m., May 28, by P. W. Guiney, Constructing Quartermaster, for the installation of plumbing fixtures in ward B, Post hospital, Fort Sam Houston, Tex.

Fort Sam Houston, Tex.—Until 11 a. m., June 9, by P. W. Guiney, Constructing Quartermaster, for the construction, plumbing, hot water heating and electric work of two four-set officers' quarters, one field officer's quarters, one guard house, one administration building, three single stable guards and shops and three artillery stables.

Cheyenne, Wyo.—Until 9:30 a. m., June 6, by Constructing Quartermaster V. K. Hart, for the construction of target butts, target houses and range office. Plan No. 266, at Fort D. A. Russell, Wyo.

Cheyenne, Wyo.—Until 9:30 a. m., May 23, by C. K. Hart, Constructing Quartermaster, for the construction, plumbing, wiring for electric motors and lights, electric fixtures, furnishing and installation of laundry machinery and equipment boiler, feed pump, etc., for one laundry. Plans No. 234-B, Fort D. A. Russell, Wyo.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

New London, Conn.—Until 11 a. m., May 30, by Capt. F. T. Arnold, Constructing Quartermaster, for the construction of approximately 2,900 ft. of macadam road and 2,500 ft. of road drains at Fort Terry, N. Y., and relaying 1,000 lin. ft. of sewers at Fort Mansfield, R. I. and for the construction of a band stand at Fort H G. Wright, N. Y.

Fort Screven, Ga.—Until 11 a. m., June 1, by Constructing Quartermaster, Fort Screven, Ga., for the construction of roads, walks, etc.

Osage, Ia.—Until 7:30 p. m., May 31, by City Clerk, for the construction of concrete pavement including the approximate quantities: 25,525 sq. yds. concrete pavement, 7,360 lin. ft. cement curb, 231 sq. yds. track pavement, 800 cu. yds. excavation, etc. Bids on above must be made on blank proposals furnished by city, and accompanied by certified check of $1,000.00. One improvement of 2,828 sq. yds. concrete pavement, 800 lin. ft. cement curb, 200 cu. yds. excavation. S. B. Gardner, Eldora, Ia., is Engineer.

Bloomfield, Ind. Until 2 p. m., June 7, by County Commissioners, for the construction of a gravel road in Fairplay Township. Peter M. Cook is Auditor of Green County.

Bloomfield, Ind.—Until 2 p. m., June 7, by County Commissioners, for the construction of a gravel road in Stafford Township. Peter M. Cook is Auditor of Green County.

Muncie, Ind.—Until 10 a. m., June 8, by County Commissioners, for the construction of a highway in Center Township. Joseph E. Davis is Auditor of Delaware County.

Gary, Ind.—Until 7 p. m., May 23, by Harry G. Moose, City Clerk, for the improvement of 16th Ave., from Broadway to George St. The work includes: 5,534 cu. yds. grading, 9,094 sq.

yds. macadam, 2,435 sq. yds. cement walk, estimated cost $13,776.00, 4,743 lin. ft. curbing.

Delphi, Ind.—Until noon, June 6, by County Commissioners, for the construction of a gravel road in Tippecanoe Township. M. G. Haun is Auditor of Carroll County.

Kentland, Ind.—Until 2 p. m., June 6, by County Commissioners, for the construction of a macadam road. Elmer R. Bringham is Auditor of Newton County.

Madison, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction of a gravel road in Madison Township. John Hoagland is Superintendent of Jefferson County.

Marion, Ind.—Until 2 p. m., June 7, by County Commissioners, for the construction of a stone road in Monroe Township and two vitrified brick highways in Center Township. A. Y. Stone is Auditor of Grant County.

Monticello, Ind.—Until noon, June 7, by County Commissioners, for the construction of a stone road in Union and Big Creek Townships. A. G. Fisher is Auditor of White County.

Mt. Vernon, Ind.—Until 2 p. m., June 7, by County Commissioners, for the construction of a gravel road in Black Township. Paul Maier is Auditor of Posey County.

Peru, Ind.—Until noon, June 15, by County Commissioners, for the construction of a macadam road in Peru Township. Charles Griswold is Auditor of Miami County.

Rushville, Ind.—Until June 7, by County Commissioners, for the construction of brick streets in Rushville and suburbs. J. M. Stone is Auditor of Rush County.

Vincennes, Ind.—Until 2 p. m., June 7, by County Commissioners, for the construction of a gravel road in Harrison Township. J. T. Scott is Auditor of Scott County.

Wabash, Ind.—Until 10 a. m., June 9, by County Commissioners for the construction of highway on line dividing Wabash and Huntington Counties. John W. Weaver is Auditor of Weaver County.

Augusta, Ky.—Until June 1, by J. T. McCracken, for the construction of 7,800 ft. of 14-ft. wide pike.

Fort Riley, Kan.—Until 10 a. m., June 1, by Capt. W. M. Whitman, Constructing Quartermaster, for the construction of approximately 4,500 cu. yds. of grading for roadways, 6,600 sq. yds. of macadam road surface, 3,900 lin. ft. of concrete curb and gutter, 110 ft. of concrete driveway curb, 6 concrete catch basins, 500 lin. ft. of 12-in. culvert pipe, 200 lin. ft. 10-in. culvert pipe, 8,000 sq. ft. concrete sidewalk, 950 sq. ft. of concrete walk road crossing, concrete steps, etc.

Independence, Kan.—Until 2 p. m., May 26, by T. S. Underwood, City Clerk, for the improvement of 11th St., from Main to Railroad St.; Myrtle St., from 14th to Missouri Pacific Ry.; Maple St., from Penn Ave. to 15th St. A. D. Stivers is City Engineer.

Boston, Mass.—Until noon, May 23, by Guy C. Emerson, City Street Superintendent, for the construction of wood block pavement on Milk St., between Pearl and Oliver Sts.; Pearl St., from Milk 148 ft. south; Oliver St., from Milk 158 ft. south.

Portland, Me.—Until 10 a. m., May 31, by Capt. C. F. Humphrey, Jr., Portland, Me., for the construction of roads and walks and other improvements at Fort McKinley and Fort Williams, Me.

Jackson, Miss.—Until 3 p. m., June 7, by Board of Aldermen, for the construction of approximately 29,000 sq. yds. of paving and 10,000 lin. ft. of curb. B. H. Klyce is City Engineer.

Trenton, Mo.—Until 8 p. m., May 25, by R. T. Preston, City Clerk, for the grading, paving and curbing of 16,000 sq. yds. of brick pavement on 4-in. concrete base, 1½-in. sand cushion and cement filler. Official advertisement of the work will be found elsewhere in this issue.

Fort Hancock, N. J.—Until noon, May 31, by C. J. Goodier, Constructing Quartermaster, for the construction of roads and walks at Fort Hancock, N. J.

Belvidere, N. J.—Until 2 p. m., May 28, by Board of Chosen Freeholders, J. R. Thatcher, Director, for macadamizing the public road beginning in Buttzville, 500 ft. west of the D. L. & W. Railroad crossing east of Buttzville, and extending to the town line of Belvidere, a distance of 19,418 ft.

Dunkirk, N. Y.—Until June 2 (readvertisement of bids asked May 14), by common council for paving Swan and Fox Streets.

New York, N. Y.—Until 11 a. m., May 18, by Borough of Brooklyn President, Room 2, Borough Hall, for 33 street improvement contracts, the largest ones including 11,590 sq. yds. of granite pavement, Class B, with tar and gravel joints (one year's maintenance); 20 sq. yds. of old stone pavement, to be relaid; 1,945 cu. yds. of concrete, for pavement foundation; 6,710 lin. ft. of new curbstone, set in concrete; 100 lin. ft. of old curbstone, reset in concrete; 635 sq. ft. of new granite bridgestones; 90 sq. ft. of old bridgestones, relaid.

New York, N. Y.—Until 11 a. m., May 25, by President Borough of Brooklyn, Room 2, Borough Hall, for 21 street improvement contracts. The largest calls for 9,253 sq. yds. of asphalt pavement, 1,293 cu. yds. of concrete pavement. The amount of security required for this contract is $4,900.

New York, N. Y.—Until 11 a. m., May 24, by Borough of Queens President, New York, N. Y., for the regulating and grading of William St., from Harris Ave. to Wilber Ave., and for curbing and flagging from Jane St. to Wilber Ave., First Ward. The work includes 3,800 cu. yds. of earth excavation, 11,200 cu. yds. of embankment, 1,080 lin. ft. cement curb, 5,400 sq. ft. of new flagstone sidewalk.

New York, N. Y.—Until 11 a. m., May 24, by President Borough of Queens, New York, N. Y., for repairing and maintaining sheet asphalt pavement in the Borough of Queens. The work includes 100 cu. yds. of concrete, 16,000 sq. yds. of sheet asphalt pavement; 1,000 sq. yds. of block pavement.

New York, N. Y.—Until 11 a. m., May 24, by President Borough of Queens, for regulating, grading, curbing and laying sidewalks and crosswalks in Prospect Ave., from Webster Ave. to Payntar Ave. The work includes 7,200 cu. yds. of earth excavation, 2,540 lin. ft. of cement curb; 13,350 sq. ft. of new flagstone sidewalk.

New York, N. Y.—Until 11 a. m., May 24, by President Borough of Queens, City of New York, for paving with asphalt blocks on a concrete foundation in Academy St., from Freeman Ave. to Webster Ave., First Ward. The work will include 100 cu. yds. of earth excavation, 265 cu. yds. concrete, 2,100 sq. yds. of asphalt block pavement.

Wadesboro, N. C.—Until 3 p. m., June 3, by Mayor and Commissioners of the town, for the improvement of streets including approximately 18,000 sq. yds. of 8-in. macadam, using tar or asphalt as a binder; 2,500 lin. ft. of combined concrete curb and gutter; 6,000 sq. yds. cement sidewalk; 4,000 cu. yds. excavation. White & Platt, Durham, N. C., are Engineers. Official advertisement of the work will be found elsewhere in this issue.

Laurinsburg, N. C.—Until noon, May 23, by M. L. John, Mayor, for about 2,500 sq. yds. of concrete sidewalk paving, with curb and gutters. F. F. Wetmore is engineer.

Fort Sam Houston, Tex.—Until 11 a. m., June 9, by P. W. Guiney, Constructing Quartermaster, for the macadamizing of roads, construction of concrete gutters, concrete walks, etc., at Fort Sam Houston, Tex.

De Pere, Wis.—Until 10 a. m., May 23, by Committee on Streets and Walks, for furnishing all materials and doing all work necessary to improve George St., from Broadway to Huron St. The work includes grading and the construction of concrete pavement and cement curb and gutter. E. X. Collette is a member of the committee.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Los Angeles, Cal.—Until July 1, by Board of Public Works, for the construction of 11 miles of riveted steel pipe ranging in diameter from 9 to 11 ft. and in thickness of plate from ¼ to 1 in. These syphons will be built along the line of the Aqueduct between Los Angeles and Owens Valley. Official advertisement of the work will also be found in this issue.

Brush, Colo.—Until 1 p. m., May 23, by S. N. Leerskov, Clerk of the Town, for the construction of a system of sewers for sanitary and storm drainage in the Brush Sewer Districts 1 and 2. The approximate quantities are 19,200 ft. 8-in. pipe sewer, 4,100 ft. 10-in. pipe, 1,300 ft. 12-in. pipe, 17,000 ft. 15-in. pipe, 48 ft. C. I. outlet, 55 M. H. 650 ft., 8 flush tanks, 50 M. H. 500 ft. and 1,600 ft. ½-in service pipe. Charles Meeker, McCook, Neb., is Consulting Engineer.

Washington, D. C.—Until 2 p. m., May 23, by District Commissioners, for the construction of sewers in the District of Columbia.

Waukon, Ia.—Until 7:30 p. m., June 1, (change of date), by S. M. Stone, city clerk, for the construction of a sewer system and sewage disposal plant. Iowa Engineering Co., Clinton, Ia., are the engineers.

Cedar Falls, Ia.—Until 7:30 p. m., May 20, by City Council, for the construction of a storm sewer on portions of Seventh and Olive Sts. The work includes 1,865 lin. ft. of No. 1, 24-in. salt glazed vitrified sewer pipe; 320 ft. of No. 1 12-in. salt glazed vitrified sewer pipe; 16 catch basins, and 5 manholes.

Cedar Falls, Ia.—Until 7:30 p. m., May 20, by City Council, for the furnishing of all necessary labor and material for the construction of sanitary sewers in portions of 9 streets. H. Jacob Pfeiffer is Mayor.

Chicago, Ill.—Until 11 a. m., May 28, by Department of Public Works, John J. Hanberg, Commissioner, for necessary labor and material for the alteration of the Chicago Avenue Pumping Station.

Gary, Ind.—Until 7 p. m., May 23, by Harry G. Moose, City Clerk, for the construction of Local Sewer No. 10, consisting of 746 lin. ft. 18-in, vit. pipe, 750 lin. ft. 15-in. vit. pipe, 1,046 lin. ft. 12-in. vit. pipe, 1,042 lin. ft. 12-in. vit. pipe, estimated cost $7,143; 312 lin. ft. 8-in. vit. pipe, 20 manholes, 4 catch basins. A. P. Melton is City Engineer.

Caldwell, Kan.—Until 3 p. m., June 1, by J. R. Swartzel, City Clerk, for the material and construction of a sewerage system. The bids will be received as follows: 1. For furnishing all materials and constructing a complete sewerage system and disposal plant. Certified check, $1,000.00. 2. For furnishing cast iron pipe and special castings, f. o. b. cars, Caldwell, Kan. Certified check, $500.00. 3. For furnishing hydrants and valves, f. o. b. cars, Caldwell, Kan. Certified check, $100.00. 4. For hauling and laying cast iron pipe and setting hydrants and valves. Certified check, $100.00.

Boston, Mass.—Until noon, May 20, by Guy C. Emerson, City Superintendent of Streets, for the construction of a sewerage works in Gainsborough and St. Botolph Sts., Roxbury.

Boston, Mass.—Until noon, May 24, by Guy C. Emerson, Superintendent of Streets, for the construction of a pipe sewer and appurtenances in Johnston Road, from Harvard St. 510 ft. easterly Dorchester.

Boston, Mass.—Drains.—Until noon, May 24, by Guy C. Emerson, Superintendent of Streets, for the construction of concrete and pipe surface drains and appurtenances in Lucerne, Claxton, Floyd and Stratton Sts., and in Colonial and Massasoit Aves., Dorchester.

Monroe, Mich.—Until May 29, by Board of Public Works, for the construction of a 10-in. glazed tile sanitary sewer in Riverview Ave., commencing at a point in the center of Riverview Ave., 50 ft. south of south line of Noble Ave., thence in a southerly direction in the center of Riverview Ave., to a point where the center lines of Riverview and Elm Aves. intersect, thence southerly on the same course to an entrance into the river basin.

Fort Missoula, Mont.—Until 9 a. m., June 6, by Constructing Quartermaster, Maj. A. B. Shattuck, for the construction of a sewer system, a water distributing system, furnishing and erecting a 300,000-gal. tank of steel and 100 ft. trestle, the construction proper of a reinforced concrete pumping station, supply and installation of all boilers, steam pumps, valves, etc.

Havelock, Nebr.—Until June 7, by C. A. Currie, city clerk, for the construction of a water works and sewer system. Grant & Cetton, Lincoln, Nebr., are the engineers.

Fargo, N. D.—Until 5 p. m., May 23, by City Auditor, E. R. Orchard, for the necessary labor and materials for the construction of a 12-in. lateral sewer on 4th St. north extending from 11th Ave., north to 12th Ave., north in Sewer District No. 1.

Fort Sill, Okla.—Until 10 a. m., June 10, by Capt. David L. Stone, Constructing Quartermaster, for the construction of a sewage purification plant and 500,000-gal. reservoir at Fort Sill.

Regina, Sask.—Until noon, May 30, by A. E. Chivers, city clerk, for the construction of storm water sanitary trunk sewers and disposal works. A. J. McPherson is consulting engineer.

Morristown, Tenn.—Until 1 p. m., May 24, by R. E. Smith, Secretary, Sewer Building Committee, for furnishing necessary materials for laying complete about 8½ miles of sewers varying in size from 6 to 24-in. in diameter. The work includes flush tanks, manholes, lamp holes and sewage disposal plant consisting of tanks, sprinkling filters and sedimentation tank. Official advertisement of the work will also be found in this issue.

Clarksburg, W. Va.—Until noon, June 15, by Water Works and Sewerage Board, Scott G. Highland, secy., for furnishing and laying cast-iron water pipe, valves and appurtenances in this city and vicinity. The work includes approximately 10,000 ft. of 16-in., 900 ft. of 12-in., 1,000 ft. of 10-in., 10,000 ft. of 8-in., 6,000 ft. of 6-in., 500 ft. of 4-in. cast-iron water mains, 50 gate valves from 4 to 16 in. in size, with valve boxes, and 35 hydrants.

Vancouver, Wash.—Until June 15, by city clerk, for the construction of the "B" St. lateral. The work, which is estimated to cost $7,000, includes 600 ft. of 10-in. and 2,000 ft. of 8-in. vitrified pipe and 11 manholes. Plans have been made by H. H. Lotter, engineer, Vancouver, Wash.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Logan H. Roots, Ark.—Until June 6, by Constructing Quartermaster, for the erection of a steel tank of 150,000 gals. capacity.

Waterbury, Conn.—Dam.—Until 8 p. m., June 7, by Board of Public Works, for furnishing labor and material for the construction of a storage reservoir dam. The work includes approximately: Concrete masonry, 1:3:6, 25,600 cu. yds.; concrete masonry, 1:3:5, 5,000 cu. yds.; concrete blocks, 2,960 cu. yds.; rolled embankment, 525,000 cu. yds.; crushed stone, 5,900 cu. yds.; paving, 8,900 cu. yds.; loaming on dam, 6,300 cu. yds.; loaming adjacent areas, 5,000 cu. yds.; sodding, 18,840 cu. yds.; drain gate house complete, exclusive of foundation; service gate house complete.

New Baden, Ill.—Until 7:30 p. m., June 1, by Public Improvement Committee, for furnishing necessary labor and material for the construction complete of water works system, including cast iron pipe, valves, fire hose and reel. A certified check for 5 per cent; bond full amount of contract. Plans and specifications are on file at the office of the Village President, George J. Munken, New Baden, Ill. Fuller-Coult Co., Chemical Bldg., St. Louis, Mo., are the engineers.

Danville, Ill.—Until noon, June 3, by Danville Water Co., Danville, Ill., for the improvement

of the water works. The work includes the reconstruction of the concrete dam. Official advertisement of the work will be found elsewhere in this issue

Boston, Mass.--Until 2:30 p. m., May 25, by Metropolitan Water and Sewerage Board, for laying 8,830 ft. of 60-in. cast-iron water pipe at Newton, Mass.

Willmar, Minn.—Until 8 p. m., May 23, by City Council, for necessary labor and material for the construction of approximately 4,500 ft. of 4-in. water mains and 6 fire hydrants. H Gunderson is City Clerk.

Fort Keogh, Mont. Until 1 p. m., May 20, by Capt. H. P. Howard, Depot Quartermaster, for sinking three 4-in. and one 6-in. artesian wells

New York, N. Y. Until 11 a. m., May 24, by Board of Water Supply, 165 Broadway, New York, for Contract 80, For the construction of the Breakneck Tunnels, portions of the Hudson River Division of the Catskill Aqueduct, comprising about 710 ft. of plain concrete conduit, known as aqueduct in open cut, or cut and-cover aqueduct, 17 ft. high by 17 ft. 6 in. wide inside, and a tunnel on the hydraulic gradient, about 1,055 ft. long, 17 ft. high by 13 ft. 4 in. wide inside, connecting by a shaft about 590 ft. deep with a deep pressure tunnel 14 ft. inside diameter and about 700 ft. long. The work is located in the Towns of Fishkill, Dutchess County, and Phillipstown, Putnam County, N. Y.

New York, N. Y.—Until 11 a. m., May 24, by Board of Water Supply, 165 Broadway, New York, for furnishing, delivering and installing six 6-ft. by 15-ft. sluice-gates, twenty-five 5-ft. by 13-ft. sluice-gates, four 5-ft. by 8-ft. back pressure sluice-gates, seven 5-ft. by 8-ft. sluice-gates, six 5-ft. by 6-ft. sluice-gates, three 4-ft. by 5-ft. sluice-gates, eight 3-ft. by 5-ft. sluice-gates, three 30-in. by 42-in. sluice-gates, two 18-in. by 24-in. sluice-gates, with operating mechanisms, 2 sets of drive-shafting and all appurtenances.

Mt. Pleasant, Tenn.—Until June 1, by city council, for necessary material and labor for the construction of a gravity system of water works. Bonds amounting to $40,000 have been sold for the purpose. Granbery Jackson, 1021 Stohlman Bldg., Nashville, Tenn., is engineer in charge.

Johnson City, Tenn.—Until May 19, by City Clerk, for the construction of a water supply system. The work includes among other items, 12 miles of 18-in. gravity main and a 5,000,000-gal. reinforced concrete reservoir. W. M. Dunlap, Johnson City, Tenn., is Engineer.

Clarksburg, W. Va.—Until noon, June 15, by Scott G. Highland, Secretary, Board of Water Works and Sewerage, for the construction of a mechanical filter plant and appurtenances. The work includes a mechanical filter plant of 3,000,000 gals. capacity, complete with a 200,000-gal. clear-water basin and 600,000-gal. coagulating basin built of reinforced concrete, with a brick and steel filter building, two 3,000,000-gal. low-lift centrifugal pumps, driven by high-speed engines, a 3,000,000-gal. multi-stage turbine high-lift pump driven by a steam turbine, two 200-hp. water-tube boilers, a new brick and steel boiler house, and a 1,000,000-gal. reinforced concrete reservoir, together with all steam and water piping connections and a new 16-in. cast-iron suction line.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Logan H. Roots, Ark. Water Heating.—Until June 6, by Constructing Quartermaster, for the construction or installation of a water heating system in barracks No. 1, Fort Logan H. Roots, Ark.

Whipple Barracks, Ariz.—Ice Plant—Until 3 p. m., May 31, by Lieut. G. G. Bartlett, Constructing Quartermaster, for furnishing labor and material required for the construction of an ice plant.

Washington, D. C.—Reels & Carts—Until June 1, by William Crozier, Brigadier General, U. S. Army, chief of ordnance, Washington, D. C., for the furnishing of 67 reels and 31 carts.

Fort Des Moines, Ia.—Heating Plant—Until 3 p. m., June 3, by Constructing Quartermaster, Fort Des Moines, Ia., for the installation of a steam heating plant in the hospital at Fort Des Moines, Ia

Portland, Me.—Electric Lighting System.—Until 10 a. m., June 2, by Capt. C. F. Humphrey, Jr. Constructing Quartermaster, for the construction and remodeling of an electric lighting system at Fort McKinley, Me.

Tompkinsville, N. Y.—Boat—Until May 27, by Engineer Third Light House District, Tompkinsville, N. Y., for furnishing a power boat for the Stratford Point Light Station, near Stratford, Conn.

Omaha, Neb.—Freight Elevators.—Until 11 a. m., June 11, by Capt. F. C. Bolles, Constructing Quartermaster, for installing two electric freight elevators in storehouse at Omaha Depot

Fort Meade, S. Dak.—Dam—Until 10 a. m., June 1, by Constructing Quartermaster, for the construction of concrete dam with clearing reservoir site in connection with Fort Meade, S. Dak., water system.

Vancouver Barracks, Wash. Plumbing.—Until 11 a. m., May 27, by Constructing Quartermaster, for the construction of the remodeling of plumbing in eight barracks and four water closet buildings at this post.

Milwaukee, Wis.—Natatorium—Until 10:30 a. m., May 20, by Board of Public Works, for the furnishing of all material and labor necessary for laying new cement floors in first story of natatorium, in toilet rooms, in the northwest side natatorium on the corner of 60th and North Ave.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Mobile, Ala.—Placing Soil—Until 11 a. m., June 7, by Maj. J. H. Jervey, U. S. Engineer, Mobile, Ala., for furnishing and placing top soil at Fort Morgan, Ala.

Council Bluffs, Ia.—Ditch Work.—Until 9 a. m., June 9, by Board of County Supervisors, for the construction of a drainage ditch along the course of Pigeon Creek in Neola, Boomer, Hazel Dell and Crescent Townships, approximately 14 miles in length. Work is also noted under confirmed reports in this issue.

Rockwell City, Ia.—Drain—Until 1 p. m., May 23, by county auditor, for the construction of Joint Drain No. 70 in Webster County and Drain No. 95 in Calhoun County. The work is also noted under Confirmed Reports.

New Orleans, La.—Levee Work—Until noon, May 25, by Board of State Engineers, 402 Cotton Exchange Bldg., New Orleans, La., for the enlargement of several levees in the Mississippi River, right bank. The work is also noted under Confirmed Reports in this issue.

New Orleans, La.—Dredging—Until 11 a. m., June 10, by Lancing H. Beach, Lt.-Col., U. S. Engineer, Custom House, New Orleans, La., for dredging at Chefuncte and in Bogue Falia Rivers, La.

Guayama, P. R.—Dams, Canal—Until 2 p. m., July 25, by B. M. Hall, Chief Engineer, Irrigation Service, Porto Rico, for the construction of the Carite Dam, 150,000 cu. meters of earth and loose rock; the Toro Negro Dam, 15,000 cu. meters of earth and loose rock, and the Dona Juana Canal, 1 1-3 miles in length. The estimated total cost of the work is $160,000. The work is also noted under Confirmed Reports.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Montgomery, Ala.—Fire Dept. Equipment.—Until noon, June 6, by Robert Tait, City Treasurer, for the installation of two steam fire engines Nos. 1 and 2; two combination chemical and hose auto cars; 6,000 ft. of 2½-in. rubber-lined hose.

Washington, D. C.—Wire & Cable—Until May 21, by Chief Signal Officer, War Department, Washington, D. C., for furnishing four miles of cable, type 213; 5,000 ft. cable, type 401; 5,500 ft. cable, type 403; 20,00 ft. cable core, rubber insulated; 1 conductor and 40,000 ft. antenna wire.

Washington, D. C.—Supplies—Until 2:30 p. m., June 1, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing chain blocks, screw jacks, boiler clamps, cotters, cable, pliers, gauge glasses, leather belting, dredging sleeves, copper frames, etc.

Washington, D. C.—Steel Framing, Cast-Iron Mullions, Etc.—Until 10 a. m., June 9, by R. V. LaDow, Supt. of Prisons, Washington, D. C., for furnishing and delivering at the United States Penitentiary, Leavenworth, Kan., steel framing and cast-iron mullions, frames, sills, heads, etc., for the sun room and for the windows to dispensary, examination roof and operating room, in the north wing of the hospital building.

Washington, D. C.—Steel Framing, Cast-Iron Mullions, Etc.—Until 10 a. m., June 9, by Department of Justice, R. V. LaDow, Supt. of Prisons, Washington, D. C., for the furnishing and delivering at the U. S. Penitentiary, Atlanta, Ga., steel framing and cast-iron mullion frames, sills, heads, etc., for the sun room and for the windows to dispensary, examination room and operating room in the north wing of the hospital.

Fort Sheridan, Ill.—Boilers—Until noon, May 23, by Capt. M. E. Saville, Constructing Quartermaster, for the installation of 10 steam heating boilers and ten area entrances in officers' quarters at Fort Sheridan, Ill.

Chicago, Ill.—Fire Brick.—Until 11 a. m., May 21, by Department of Public Works for furnishing approximately 50,000 fire brick for boiler lining and delivering at city water pumping stations. B. J. Mullaney is Commissioner of Public Works.

Chicago, Ill.—Suction Hose.—Until 11 a. m., May 24, by James Horan, Fire Marshall, for furnishing the city of Chicago hose as follows: 10 lengths 3½-in. suction hose, 11 ft. long; 30 lengths 4-in. suction hose, 10 ft. 6 ins. long; 20 lengths 4½-in. suction hose, 11 ft. long; 10 lengths 5-in. suction hose, 11 ft. long.

Chicago, Ill.—Fire Hose.—Until 11 a. m., May 24, by James Horan, Fire Marshall, for furnishing the fire department with 2,000 ft. of 1-in. 4-ply rubber chemical hose, with special couplings.

Jeffersonville, Ind.—Fire Apparatus — Until May 21, by Maj. Joseph T. Davidson, Depot Quartermaster, for furnishing 22 fire extinguishers, 10 pairs roof hooks, 7 extension ladders and 5 single ladders.

Franklin, Ind.—Voting Machines.—Until noon, June 6, by County Commissioners, for voting machines. W. B. Jennings is Auditor of Johnson County.

Boston, Mass.—Stone—Until noon, June 6, by Lieut.-Col. Edward Burr, U. S. Engineer, Boston, Mass., for furnishing riprap stone in dike on Long Beach, Plymouth Harbor, Mass.

Newark, N. J.—Cast-Iron Pipe.—Until 3:30 p. m., May 19, by Board of Street and Water Commissioners, for furnishing: 48 short tons of 4-in. cast-iron water pipe; 553 short tons of 6-in. cast-iron water pipe; 85 short tons of 8-in. cast-iron water pipe; 38 short tons of 10-in. cast-iron water pipe; 24 short tons of 12-in. cast-iron water pipe; 200,000 lbs. of ordinary special castings; 15 short tons of 6-in. high pressure cast-iron water pipe; 37 short tons of 8-in. high pressure cast-iron water pipe; 431 short tons of 16-in. high pressure cast-iron water pipe. Morris R. Sherrerd is Chief Engineer of the board.

New York, N. Y.—Cement—Until noon, May 31, by George Cromwell, President of Borough of Richmond, for furnishing and delivering 300 barrels of Portland cement.

Wilmington, N. C.—Stone—Until noon, June 14, by Capt. Earl I. Brown, U. S. Engineer, Wilmington, Del., for furnishing 12,000 tons, more or less of riprap stone.

Philadelphia, Pa.—Ordnance Supplies—Until 1 p. m., May 13, by Commanding Officer, Frankford Arsenal, Philadelphia, Pa., for furnishing during the fiscal year ending June 30, 1911, smokeless powder; cloth, ropes, forage, steel and iron, sheet tin and zinc, pig lead, copper and tin, iron castings, cartridge metals, hardware, steam fitting and electrical supplies, leather belting and laces, lumber, fuel, chemicals, oils, paints, paper, binders' board, tools and miscellaneous articles

Fort Sam Houston, Tex.—Hardware, Etc.—Until May 20, by Capt. Fred H. Gallup, Quartermaster, for the furnishing of: 50 screw anchors, 3 outlet boxes, 24 bushings, 1 condulet, 150 ft. steel conduit, three covers, 150 ft. lamp cord, 12 couplings, 50 cleats, 3 lamp guards, 12 lock nuts, 1 gross screws, 3 sockets, 50 strap hangers, 2 pounds Manson tape and 150 ft. wire.

Fort George Wright, Wash.—Screens—Until 11 a. m., May 24, by Lieut. A. L. Sneed, Quartermaster, for furnishing wood frames for doors and windows and screens on one administration building, four sets captains' quarters and one bake house at Fort George Wright, Wash.

CONTRACT LET.

The following contracts have been let recently:

BRIDGES.

Rockport, Ind. Bridges.—A. E. & W. Construction Co., Evansville, Ind., at $9,150, for the construction of the Lake Drain bridge.

Princeton, Ind.—Bridges—County Commissioners awarded the following contracts for the construction of 15 concrete arches and 10 steel bridges: A. E. & W. Construction Co., Evansville, Ind., at $3,973, seven concrete arches; Frank Duncan, this city, at $9,500, eight concrete arches and five steel bridges; Vincennes Bridge Co., Vincennes, Ind., at $3,553, five steel bridges.

Owensboro, Ky. Bridge Vincennes Bridge Co., Vincennes, Ind., at $1,760, for the construction of a new iron bridge across north Panther Creek at Taylor's mill road.

Portland, Mich.—Bridge—Wynkoop Co., Toledo, O., at $9,444, for the construction of a single span steel bridge across the Grand River at Turner's ford, in Danby Township.

Hampton, N. J.—Culvert—Gaston & Richards, Somerville, at $18,000, for the enlargement of the Central Railroad culvert at this city.

Mt. Gilead, O. Bridges.—Following contracts have been awarded in N. Bloomfield Township: Brookville Bridge Co., West Sorrick bridge, $733; Eckles & Hoff, Seif bridge, $83; Brookville Bridge Co., Selover bridge, $83; Brookville Bridge Co., East Sorrick bridge, $733.

Corvallis, Ore.—Bridge—F. A. Erixson, at $6.90 per yd., for the construction of the piers on which the Mary's River steel bridge, at the south end of Third St. will rest. The total cost of the work will be about $5,000.

Aberdeen, S. Dak.—Bridge—A. Y. Bayne Co., Minneapolis, Minn., at $3,305, for the construction of a 42-ft. steel bridge in Riverside Township.

Motesano, Wash.—Bridge—Bradley & Whitlock, at $44,780, for the building of the new bridge over the Chehalis River, at this place. The bridge is to be of steel, with draw span of two clear openings of 100 ft. each.

Des Moines, Ia.—Nate Frankel, Vice President of the Harris-Emery Co., is having plans prepared for the construction of a boulevard between Woods and Marsh drives. John Budd, City Engineer.

Council Bluffs, Ia.—Petitions are in circulation for the paving of Broadway and South Main St.

Jeffersonville, Ky.—County Commissioners will build a free gravel road from Henryville to the Washington County Line. Charles W. Kelly is the Engineer.

Calumet, Mich.—Calumet Township Board has instructed the engineer to prepare specifications for the building of a new piece of road in the Trap Rock River Valley District.

Virginia, Minn.—City Council directed that $12,500 be turned over to the Park Board for fitting up Chestnut St. Property owners requested that pavements be laid as follows. On Chestnut St. between Central and Virginia Ave.; Central Ave. from Willow to Sage St.; Maple St. from Railroad to Virginia.

Two Harbors, Minn.—County Commissioners will probably ask for bids for the construction of the road between this city and Knife River sometime during this month.

South St. Paul, Minn.—City Engineer W. A. Hunt has estimated the cost of the improvements on Concord St. contemplated for the coming summer at $8,160. This will cover the expense of grading, leveling and macadamizing the main thoroughfare to and from St. Paul for a distance of about 3,000 ft. from Annapolis St. south.

St. Louis, Mo.—Million Club of this city contemplates the construction of a saucer-type motor track. Charles F. Wenneker is President of the club.

Hollister, Mo.—A special road district is being organized between this city and Kirbyville for the purpose of constructing a wagon road between those points.

Indianola, Miss.—Indianola Dirt Road Construction Co. has been organized with a capital stock of $10,000 for the purpose of contracting for and building 100 miles of good roads in the territory adjoining Indianola.

Portsmouth, O.—Citizens from Washington Township have petitioned the County Commissioners for the widening and extension of the Portsmouth and Galena turnpike at a distance of two miles up Dry Run.

Columbus, O.—County Surveyor Hugh K. Lindsey has completed plans for the improvement of the road from Clintonville to Worthington and the road will be ordered improved by the County Commissioners. The distance is three miles.

Columbus, O.—Approximately 48 miles of highways in Franklin County will be improved during the coming summer at a cost of $246,000. The work will be done through the co-operation of the state, county, townships and property owners. Hugh K. Lindsey, County Surveyor.

Covington, O.—County Commissioners have authorized the General Superintendent of Roads to make plans and specifications for a number of roads and bridges throughout the county, especially the Banklick Bridge.

Sandusky, O.—County Commissioners have decided to repair the old plank road now known as Columbus Pike from the corporation line to the Seven Mile House.

Ashland, O.—J. F. Welty, Auditor of Ashland County, will sell bonds May 23 in the sum of $40,000 for road improvements.

Bellefontaine, O.—City Auditor U. L. Kennedy will sell bonds May 23 in the sum of $35,000 for the improvement of Main St.

Perry, Okla.—City will hold an election to vote on the issuance of bonds in the sum of $25,000 for public improvements.

Harrisburg, Pa.—Plans are well under way for the paving of Derry St. in the 13th Ward and part of Front St. north of Maclay St.

Harrisburg, Pa.—Supervisors of East Pennsboro Township have decided to communicate with the State Highway Department in regard to resurfacing the state road between Wormleysburg and the Northern Central Bridge, West Fairview.

Shamokin, Pa.—State will probably construct a new brick or asphalt highway from this city to Kulpmont. Joseph Hunter is State Commissioner of Highways.

Forest Lake, Pa.—Forest Lake Association has appropriated $3,000 to build a road from Mast Hope depot to the park.

Taylor, Tex.—Property owners on Main St. have agreed to pay for the paving of the center of the street. The City Council will order the paving of the entire street with vitrified brick soon.

San Marcos, Tex.—City will hold an election June 4 to vote on the proposition of issuing bonds in the sum of $20,000 for road improvements.

Ephraim, Utah.—State road commission will build a state road from the north state line to the Grand Canyon, running through Spanish Fork, Payson and Nephi. It is estimated that the road will cost about $6,000. Richard L. Lyman is vice-chairman of the commission.

Elbe, Wash.—Surveys are being made of the state road between this city and Alder preparatory to improving the same.

Montesano, Wash.—County Commissioners will construct the Elma cut off road reaching from Elma to the Thurston County Line. About $40,000 will be expended on this section of the Grays Harbor-Olympia Road. Bids are to be asked for at once.

Seattle, Wash.—State Highway Commissioner is having surveys made of the proposed route for the road to be constructed between Grays Harbor and Richmond.

Seattle, Wash.—A road 15 miles in extent across Snoqualmie pass will be rebuilt into a highway this summer.

Seattle, Wash.—Plans and specifications for the Yesler way regrade are being prepared by City Engineer R. H. Thompson. It is estimated that this work will cost $390,000. Contracts will soon be let for making a solid dirt street of Westlake Ave., from Fremont to the old Western mills, estimated to cost $127,000.

Granger, Wash.—Petition has been signed by citizens for a new highway between Granger and Alfalfa on the Northern Pacific Railroad, with a branch running to Toppenish. L. M. Hilton is interested.

Wenatchee, Wash.—Commercial Club of this city has asked for $20,000 in road funds available to Chelan county from the state aid road fund for the purpose of macadamizing Wenatchee Ave., from the city limits to the Wenatchee River bridge.

La Crosse, Wis.—County Highway Commissioners will take steps at a meeting to be held May 11 to expend $42,000 of county and town money in building good roads during the ensuing year.

Green Bay, Wis.—Brown County Commissioners have been petitioned for aid in improving highways, the amount asked by the towns aggregating $10,275.

Niagara Falls, Ont.—Queen Victoria Park Commissioners has asked for money for the construction this year of nine miles of the Fort Erie-Niagara Blvd. The road to be improved lies between Slavin Point and Miller's Creek.

Sewers.

Items Arranged Alphabetically by States.

Phoenix, Ariz.—City will hold an election May 23 to vote on the proposition of bonding the city in the sum of $33,000 for the construction of a sewer system.

Chico, Cal.—City will hold an election soon to vote on the proposition of bonding the city in the sum of $150,000 for the purpose of building a city hall, laying sewers, paving streets and fire equipment.

Sawtelle, Cal.—Citizens of this town are agitating the construction of a sewerage system. A bond issue will probably be authorized.

Los Gatos, Cal.—Board of Trustees has adopted the plans and specifications for the construction of a sewer on San Jose Ave., between Wheeler Ave. and the middle of the El Monte hill, a distance of 1,426.3 ft. Robert Chandler, city engineer.

San Francisco, Cal.—Board of Public Works has approved the specifications prepared by the city engineer for the North Point main sewer, and adopted a resolution asking the Supervisors to set aside from bond issue funds now on hand the sum of $165,000 for the construction of section A of the sewer.

San Francisco, Cal.—Street committee of the Board of Supervisors agreed to recommend that $170,000 be set aside to cover the cost of the new sewer to be put down in Seventh St., and which is to extend from Howard to Hubbell St.

Tulare, Cal.—City will hold an election May 19 to vote on the proposition of bonding the city in the sum of $80,000 for the construction of a sewer system.

San Francisco, Cal.—Plans are about completed for the $1,000,000 tunnel sewer system that it is proposed will drain the Sunset, Richmond, Parkside, Oceanside and Ingleside districts. The tunnel will be 16 ft. wide and 8 ft. high and nearly a mile in length. A system of large sewers have been planned to carry the sewage from the districts. The tunnel will be known as the Mill Rock tunnel.

Santa Clara, Cal.—An ordinance has been introduced in the city council providing for the sewering of the entire town.

Santa Ana, Cal.—City council has made known plans for building a new outfall for the Santa Ana sewer system. It will be constructed from the foot of Baker St. to the edge of the San Joaquin ranch at an estimated cost of $35,000.

Roseville, Cal.—City will probably hold an election May 28 to vote on the proposition of bonding the city in the sum of $80,000 for the purpose of building a sewer and a bridge over Dry Creek.

Lewiston, Ill.—City has voted in favor of the construction of a sanitary sewer system to cost $32,000.

Bushnell, Ill.—City has voted the issuance of bonds in the sum of $25,000 for the construction of a sewer system.

Champaign, Ill.—Board of Local Improvements passed a resolution providing for the construction of a storm sewer on West White St. The cost of the sewer is estimated at $13,500.

De Kalb, Ill.—Profiles and estimates for the proposed sewer system for this city have been prepared.

Elgin, Ill.—City Engineer Carl E. Plum is preparing plans for a sewer for the Dixon Ave. property. Connections will be made with a sewer on Grace St., and the whole lowlands of the neighborhood will be drained.

Lewistown, Ill.—City has voted to construct a $32,000 sanitary sewer system.

Marseilles, Ill.—City will soon vote on the proposition of giving the mayor and city council authority to issue city bonds in the sum of $27,000 for the purpose of constructing a sewer.

Peoria, Ill.—City Engineer Clay Belsley has prepared blue prints of a new sewer system for the territory between the bluff and the river from Cornhill St. to the city limits. This sewer will require about three miles of piping.

Peru, Ind.—Plans and specifications have been approved for a lateral sewer from Benton to Lincoln St., between Main and Fifth Sts. Bids will be received at once.

Hammond, Ind.—Board of Public Works has accepted the plans and specifications for the Huehl Ave. walks, the Ames Ave. sewer and the Walter Ave. sewer, section A.

Indianapolis, Ind.—City Engineer H. W. Klausmann has submitted to the Board of Public Works plans and specifications for a number of proposed street and sewer improvements.

Tama, Ia.—City council is taking steps toward starting the construction of a sewer system.

Clinton, Ia.—City will expend $90,000 on the completion of a sewer. R. C. Hart is city engineer.

Perry, Ia.—City council has voted to construct storm sewers on certain streets and an addition to the sanitary sewer on Willis Ave.

Clinton, Ia.—City council will probably take immediate action toward the construction of a big sewer extending from the corner of 8th Ave. and 4th St., to First Ave., emptying into the First Ave. main. The estimated cost of the sewer is $61,000.

Lake Charles, La.—An engineer has estimated the cost of the proposed sewerage system for this city at $160,000. The system will require 21 miles of pipe.

New Bedford, Mass.—The governor of Massachusetts has signed a bill authorizing this city to expend $1,600,000 for the purpose of building an intercepting sewer.

Kalamazoo, Mich.—City council has been petitioned for the extension of the sanitary sewer on Grand Ave., for about 12 rods.

Mt. Clemens, Mich.—City council has ordered the construction of a 12-in. crock lateral sewer on South Front St.

Mankato, Minn.—A storm sewer is to be constructed on Hickory St., from Fifth St. to Fourth St.

Albert Lea, Minn.—Plans are being prepared by City Engineer William Barneck for the construction of an extensive sewer system. Bids will be advertised for soon.

Duluth, Minn.—City council has been petitioned for the construction of a sanitary sewer in Gladstone St., from 40th to 45th Aves., west, and for the construction of a sewer in 59th to Grand Ave., Grand Ave. to 61st, and a connecting sewer from the alley on 61st Ave., west, to Grand Ave.

Springfield, Mo.—Citizens of the Eighth Ward are agitating the construction of a sewer in the northeast portion of the city, including most of the Eighth Ward.

Kansas City, Mo.—Plans are about completed for the building of the O. K. Creek sewer. The plans are being prepared by J. V. Hanna, chief engineer for the Kansas City Terminal Railway Co. The sewer is estimated to cost $600,000.

Tecumseh, Neb.—City Engineer Roscoe C. Gore has completed drawings of the proposed sewerage system for this city, also plans, specifications and estimates of cost. N. M. Davidson, city clerk.

Westwood, N. J.—Citizens of this town are agitating the construction of a sewerage system. Henry H. Goodwin, mayor.

Penn Grove, N. J.—Civil Engineer Clyde Potts, 30 Church St., New York, has been retained by this city to design sewers and sewage disposal works for the city. Fred A. Gentieu, mayor, Asa G. Justice, city clerk.

Geneva, N. Y.—Board of Public Works has decided to lay an extension of the sewer system through Coapland Ave., Hamilton and Ver Plank St., at an estimated cost of $1,600.

Rensselaer, N. Y.—Plans for the construction of a sewer to be built by the Hudson River Aniline Works have been approved by the mayor. The sewer will enter the river at the mouth of the dyke.

North Tonawanda, N. Y.—State Health Department has approved the plans prepared by City Engineer Smith, for the construction of the Rumbold Ave. sewer. An automatic lifting station will be installed. The system will cost about $30,000.

Brooklyn, N. Y.—Borough President Steers has ordered sewers constructed on the following streets: 65th St., from Fort Hamilton Ave. to Eighth Ave.; 18th Ave., from 86th St. to Benson Ave.; Montrose Ave., from Union Ave. to Broadway; Gravesend Ave., from Avenue J to Bay Parkway; 79th St., from 14th to 15th Aves., and 15th Ave., from 78th to 79th Sts.

Hamburg, N. Y.—City held a special election May 10 to vote on the proposition of appropriating $45,000 for the construction of sewers throughout the village.

Grand Forks, N. Dak.—City engineer has been instructed to prepare plans and specifications for extending the sewer on Forest and Elm Ave and on Brooklyn Blvd.

Minot, N. Dak.—City Commissioners have accepted the plans for a new sewer system, furnished by R. E. Wickam, assistant city engineer of Grand Forks. The work will be advertised at once.

Grand Forks, N. Dak.—City Engineer Lykken has been instructed to prepare plans and specifications for the extension of the sewer on Forest and Elm Aves. and on Brooklyn Blvd.

Ashland, O.—City council has been petitioned for the extension of the sanitary sewer on East Fourth St.

Delaware, O.—City council has declared it necessary to construct a sewer on Campbell St. from Central Ave. to Lincoln Ave., and Griswold St., from Campbell St., east to the end of the present sewer. W. E. Haas, mayor.

Cleveland, O.—Dugway Brook Improvement Association is agitating the construction of the new sewer for Dugway brook valley.

Kenton, O.—City council has declared it necessary to construct a sewer in the eastern sewer district. G. S. Binckley, city clerk.

Huntington, O.—City has voted the issuance of bonds in the sum of $275,000 for sewer and street improvements.

Zanesville, O.—City Auditor L. R. McCaddon will sell bonds May 28 in the sum of $27,000 for the construction of a sewer.

Hamilton, O.—City Engineer F. E. Weaver has prepared plans and estimates of the cost of the construction of a sanitary sewer on South Eighth St., from Hanover St. to Rigdon

St., and on Vine St. and Greenwood Ave. The sewers are estimated to cost $1,790 and $9,122, respectively.

Marblecliff, O.—State Board of Health has instructed this village to install a sewage disposal plant. Immediate action will be taken toward the installation of the plant.

Richwood, O.—City council has been petitioned for the construction of a sewer on London Ave.

Lebanon, Ore.—Survey of the proposed sewer system for this city has been completed. The cost of a 22-in. pipe for the sewer will be about $30,000, with an additional branch line from Isabella St., at a cost of about $10,000.

La Grande, Ore.—Civil Engineer Louis C. Kelsey, 402 Dooly Bldg., Salt Lake City, has been engaged as consulting engineer on the sewer system for this city, the approximate cost of which is $125,000.

Salem, Ore.—Plans and specifications have been prepared for the construction of the South Salem sewer system, which will serve the entire city south of South Mill Creek.

Lancaster, Pa.—City council has authorized the building of a sanitary and storm sewer on St. Joseph St., east from Filbert.

McKeesport, Pa.—City has engaged an engineer to prepare plans for the new sewerage system, with disposal plants.

Harrisburg, Pa.—City Engineer M. B. Cowden has completed the plans and specifications for the sewer improvements in the city, ordered by the decree of the state health commissioner.

Williamsport, Pa.—Engineer Osborne Congleton of New York has completed the plans for the sewage disposal plant for this city.

Altoona, Pa.—City Engineer Franz Engstrom has prepared plans for the construction of a sewage disposal plant.

Allentown, Pa.—City council adopted an ordinance increasing the city's bonded indebtedness by $34,500 for the construction of a sewer.

West Chester, Pa.—City will hold an election May 17 to vote on the proposition of issuing bonds in the sum of $200,000 for the construction of a sewer system.

Johnstown, Pa.—Johnstown municipal improvement committee, Dr. George W. Wagoner, chairman, has asked the city council to engage an engineer to prepare plans and specifications for the construction of a sewer system for the city.

Punxsutawney, Pa.—City is contemplating constructing a sewage disposal plant at an estimated cost of $100,000.

Bristol, R. I.—Citizens have voted to extend the sewer system in the town to completion, and have voted a bond issue of $35,000 for the payment of the extension.

La Follette, Tenn.—City will probably construct a sewer on Tennessee Ave. J. Will Taylor is mayor.

Morristown, Tenn.—Plans and specifications have been prepared for the construction of the proposed new $40,000 sewerage system, including a septic disposal plant. The work will be advertised at once.

Lampasas, Tex.—Surveyors have established grades of the streets in the city with a view to submitting proposals to the city council for putting in a sewerage system.

Spokane, Wash.—City Engineer Morton Macartney is engaged in preparing final plans for the $500,000 sewer system to be built in the Fourth and Fifth Wards.

Vancouver, Wash.—Plans have been made for the construction of the B St. lateral sewer at an estimated cost of $7,000. The work will include 600 ft. 10 in. and 2,000 ft. 8 in. vitrified pipe, and 11 manholes. Contract will be let about June 15. H. H. Lotter, engineer, city.

Spokane, Wash.—Plans and specifications for the construction of intercepting sewer No. 1, embracing the business district of the entire south side of the city and calling for an expenditure of $203,396, have been completed. Plans and specifications have also been completed for the construction of a sewer on Washington St., Sharp Ave., Cataldo Ave., Calispel St., and Boone Ave., to cost $28,428. J. C. Ralston, city engineer.

Wheeling, W. Va.—Survey has been made for the construction of a sewer on South Fourth St., between Jefferson and Monroe St.

Marinette, Wis.—City council has decided to expend $3,000 for the extension of the main brick sewer. The sewer will be extended on Lewis St., toward State St.

Janesville, Wis.—City engineer was ordered to prepare plans for a sanitary sewer on Clarence St., between Milwaukee and Court Sts.

Monroe, Wis.—City council has been petitioned to construct a sewer on Fulton St., running from the center of Russell St., south of the center of Washington St.

Wausau, Wis.—City council has been petitioned for the construction of the following sewers: East Jefferson and Muenchow St., on Seventh Ave. north from Stewart St., on Fourth St., from Forest St. to Division alley, on Fourth Ave., from Garfield to Stewart Sts., on Seventh St., north from Kickbusch, and on Garfield St.

Buffalo, Wyo.—City contemplates the construction of a sewerage system at an estimated cost of $50,000. Oliver G. Norval, mayor.

Prince Rupert, B. C.—Petition is in circulation at Prince Rupert asking the government to continue the construction of sewers in the new city until the $25,000 appropriation is exhausted.

Toronto, Ont. Provincial board has approved the plans for the sewage outfall works at New Toronto. The plans call for an expenditure of about $20,000.

Ottawa, Ont.—Provincial board has approved the plans for the west end sewage disposal for this city.

Wingham, Ont. Provincial board has approved the sewage purification plans of this city.

Ottawa, Ont.—City of Aylmer has agreed to pay half of the cost of installing a septi tank to prevent its sewage polluting the Ottawa River. City Engineer of this city will prepare plans and estimates. The cost will be about $5,000.

Water Supply.

Items Arranged Alphabetically by States.

Hartford, Ark.—City council has taken initial steps toward securing a water works system for the city. The system will probably be installed by a private company.

Waldron, Ark.—Plans are being prepared by E. W. Gantt of the Sequoyah Engineering Co., Fort Smith, for the construction of a water works for this city.

Visalia, Cal.—City has voted the issuance of bonds in the sum of $75,000 for the construction of a concrete aqueduct in Mill Creek.

Denver, Colo.—Board of Supervisors have passed an ordinance providing for the voting on the new water franchise.

Donaldsonville, Ga.—City has voted the issuance of bonds in the sum of $20,000 for the purpose of improving the water works and installing an electric light plant.

Sylvania, Ga.—City has voted the issuance of bonds in the sum of $40,000 for the construction of a water works, electric light and sewer system.

Belleville, Ill.—Belleville Water Supply Co. has elected the following officials: C. M. Horner, president; E. W. Clark, vice-president; H. P. Scanlan, secretary-treasurer. The work of laying the 16-in. water main from Second St. and Missouri Ave., East St. Louis, along State St. to the bluffs will be started at once. It is estimated that it will cost $500,000 to supply this city with water.

Joliet, Ill.—Stockyards Water Co. has been organized in this city for the purpose of constructing a private water works plant. The plant, the estimated cost of which is $1,500,000, is designed to furnish 75,000,000 gals. of water daily. Matt Berscheidt, city clerk.

Ottumwa, Ia.—City council has voted to offer the public water company of this city $265,000 for its property.

Lakeland, Ky.—It is proposed to construct a pipe line from Louisville Water Co. to the State Asylum at this city at a cost of $65,000. Engineer for the work has not yet been employed. Geo. B. Caywood, Frankfort, Ky., is secretary of board of control.

A Statement of Doctrine.

It happens that in this issue we give considerable space to records of day labor costs of doing construction work. We mention this because it suggests the opportunity for setting aright certain of our readers who have misconstrued our pronounced position in favor of contract work. It has been assumed that since this was our position we would be reluctant to present facts or figures tending to show it to be untenable, or, to be specific, to present data showing day labor work to be good and cheap. In view of all the costs of day labor work that we have published, this feeling is hard to understand. We cannot imagine it to be prevalent, but that it exists at all is reason sufficient for effort on our part to banish it. This journal believes in the economic soundness of the principle of doing construction work by contract, but it believes still more strongly in the principle that the truth should be sought always in engineering regardless of whatever person or precept is made to suffer in consequence. Instead of suppressing records and costs of day labor work, we are constantly seeking them. We have published all that we could find that were free to us to publish. We have paid and will continue to pay for the privilege of publishing all that are valuable. The doctrine of contract work has nothing to fear from truthful and complete records of day labor work or from honest discussion. When it has we shall revise our opinion, not suppress the records.

A Rational Method of Determining Reasonableness of Rates Charged by Public Service Corporations and a Discussion of the Theory of Profits.

Since America has entered upon an era of governmental regulation of public service corporations, it becomes a matter of extreme importance that the regulation shall not be of a kind that will drive new capital from this field or destroy existing incentives to reduce operating costs. Recent decisions of railway commissions, and, indeed, all important rate making decisions of the past, have been based upon the theory that there is some "reasonable" percentage of net income on invested capital—usually 6 or 7 per cent—and that rates should be so reduced as to permit no profit in excess of this "reasonable" percentage. This theory rests upon a fallacy, and is destined to work irretrievable harm, unless it shall be soon abandoned and a more rational theory adopted. Capital invested in any enterprise is obviously entitled to a return, but the return should be no more than the prevailing rate of interest on borrowed money, when well secured. Any return in excess of this rate is not a return on capital, but springs directly from the brains of the men who are managing the enterprise, and should be called profit. In all business operations involving the investment of capital and the use of a plant, we have the following items that go to make the total charge:

1. Operating expense, including taxes.
2. Amortization, or depreciation of plant.
3. Interest on invested capital.
4. Profit.

The cost of production is the sum of items 1 to 3. It is fundamentally erroneous to regard only items 1 and 2 as being the cost of production, yet this is commonly done, and in that case items 3 and 4 are erroneously regarded as "profit" on the investment.

Practically all large industrial operations are begun with borrowed capital. This capital is entitled to and must receive, its return of, say 4 or 5 per cent. The genius of the promoters of the enterprise is not shown by the use of as large quantities of this capital as possible. Precisely the reverse is true. If the promoters can build and equip a railway, for example, at a cost of $25,000 per mile, which will give the same service secured by competitors with a transportation plant costing $50,000 per mile, they have performed the function of an inventor and are entitled to an inventor's reward. But, according to the theory now in vogue, the promoters of the $25,000 line would actually be fined for their ability, because they would be allowed to earn only 7 per cent on the investment—exactly the same percentage, but half the annual sum, earned by their less able competitors with the $50,000 line.

If interest on invested capital is regarded as an element of the cost of production, as it certainly should be, we are left to consider profit (item 4) entirely unconfused by any relation to the money invested in the plant. A merchant estimates his annual profit, not in percentage of the value of the stock on hand, but in percentage of sales. This is clearly the only logical viewpoint for a manufacturer to take also, and it applies equally to all kinds of business undertakings. Let us assume, for illustration, that a public service commission were to regulate the price of dry goods sold by merchants. Applying the present theory of a "reasonable" return on the investment, they would allow, say 7 per cent return on the capital invested in stock, buildings and real estate. Hence the merchant with the most costly establishment would be entitled to secure the greatest net returns annually, while his more active or more intelligent rival who, in a less expensive building, carried a small stock which he "turned over" several times annually, would be fined for his ability to attract customers enough to secure the rapid "turnover." In other words the merchant having the greatest capital or the greatest borrowing capacity would be favored at the expense of the merchant having the least, and quite illogically so.

Let us go a step farther, and assume that all telegrams and telephone messages could be economically sent by "wireless." Manifestly the plant investment would be but a minute fraction of the present investment in pole lines, conduits and wires. But, according to the present theory of "reasonable return" on the investment, it would actually pay the present telegraph and telephone companies to buy the "wireless" patents and then speedily forget that they existed. Or, in case the patents could not be bought, we should have the spectacle of inventive genius receiving its reward in a 7 per cent return on a plant costing next to nothing!

It will be only a few years before public service corporations will fix the rates charged by express companies. The capital invested in the express business is nominal. The transporting plant upon which these companies depend is owned by railways. Aside from delivery wagons and office furniture, there is no plant owned by the average express company, yet an enormous business is transacted. Just as in our assumed case of a "wireless" plant so here, in fact, we have a nominal investment by corporations doing a business of great proportions. Shall they, too, be restricted to a 7 per cent profit on invested capital?

This *reductio ad absurdum* shows how untenable is the hypothesis that profits are a return on capital. Profits are, or should be, a return on the absence of capital and the presence of brains. Profits are not a function of money rental, but of mind rental. The man who lends his mind to the service of the public demands, and is entitled to a rental for its use, based not on the labor and capital that he expends, but on what he conserves. This elemental principle of polical economy is wholly ignored when the theory of "reasonable return on capital" is applied in regulating the rates of railways.

Upon what theory, then, shall rates be fixed? If we start with the principle that the return upon capital (item 3) is logically a part of the cost of production, we shall advance a long way toward a rational solution of the problem.

To illustrate a rational method of determining reasonable profits, let us take the steam railways of America, and let us assume that the capital invested in their construction and equipment is $45,000 per mile of roadbed. Then, according to data given in the Interstate Commerce Commission Report for the year, 1906, and upon this assumption of first cost, we have:

	Per Mile of Road.
Operating expense (including renewals)	$ 6,896
Taxes	337
Interest on $45,000 at 4½%	2,025
Total cost of production	$ 9,258
Operating revenue	$10,460
Deduct cost of production	9,258
Profit	$ 1,202

Copyright 1910, by the Myron C. Clark Publishing Co All Rights of Republication Reserved.

This profit is about 11½ per cent of the operating revenue. It is not quite 2.7 per cent of the assumed investment of $45,000 per mile. Hence the total return on capital—viewing the matter from the old standpoint—is 2.7 per cent profit and +4.5 per cent interest = 7.2 per cent.

It may chance, therefore, that a 7 per cent "return on capital" invested in railways gives a true profit of 10 or 11 per cent on gross income, and that this return is reasonable in that such managerial ability is suitably rewarded by its 10 per cent profit; but there is no necessary relation between a 7 per cent "return on capital" and a 10 per cent return on income. This is well illustrated in the case of the express companies.

One of the great advantages arising from viewing profits as a percentage of gross income is that it enables us to make use of data as to profits from business operations other than those involving large investments of capital. We can then inquire what profit the large merchant or manufacturer makes on his annual sales, wholly regardless of its direct relation to the capital invested. An average of such data will indicate the *maximum* profit that a public service corporation should be permitted to earn.

A secondary, but none the less important, advantage of this method of considering profits lies in the fact that it concentrates attention upon their true character, namely that they are returns for services differing in no essential from the fee of an architect, for example.

Men who are able to borrow money for railway construction, and the like, are commonly spoken of as capitalists. In reality they are usually not capitalists, but business managers in whom capitalists have confidence. This confidence is great or small, according as these business managers have managed very well or only moderately well. The reputation of these managers is usually of slow growth, and is based upon performance. Their profits are their compensation for brain services. With this fact in mind we are less apt to err in our judgment as to the "reasonableness" of a 10 or 12 per cent margin of profit on gross income than if we cling to the fallacious theory that profits are a return upon cash.

The average public service corporation shows little or no real profit at first. Its subsequent profits arise mainly from two causes: (1) The growth of the community it serves, and (2) the development of more economic methods of production. In the first of these sources of profit it is evident that the public itself is entitled to a large share. Yet it is not possible to draw a clear line between the two sources of profit, for the second is often dependent on the first. More economic machinery, for example, is usually a consequence of the use of larger units necessitated by the larger traffic. Thus, the reduction of grades on a railway becomes economic as a consequence of increased traffic. Larger engines, larger cars, longer trains and all the concomitant elements of unit cost reduction follow from the existence of a larger population to be served; yet they do not follow as a matter of necessity. There must be an incentive to cause the owners of the railway to introduce these labor saving features, and that incentive is profit. The state-owned railways of Europe show conclusively what happens in the absence of such an incentive. They remain what they were a generation or more ago, whereas American railways show a wonderfully progressive development as tools for economic transportation.

It is self evident that the public is entitled to a share in the increasing profits of public service corporations, but it is equally clear that it should be only a share. There are several ways in which the public may participate, such, for example, as: (1) A large tax on gross income; (2) a progressive reduction of unit rates or charges; (3) improved service, and (4) public ownership of the plant which is leased to an operating company at fixed rates. Of these methods the second and fourth seem most likely to be extensively adopted.

A progressive reduction in rates should be so adjusted as to divide increased profits between the operators and the public. Thus only can an incentive to economic production be provided. The moment a railway operator finds that his efforts at economy of operation result in a corresponding cut in rates, his efforts will cease. This is precisely what will happen if the present theory of a "reasonable return" on invested capital is persisted in. Profits (item 4) must remain sufficiently liberal to attract men of the highest ability. Yet, the profits need not be as high a percentage of the gross annual income as exist in other lines of business, for public service corporations are guarded from competition, to a large extent, by the character of their service.

It will probably be the part of wisdom not to change general rates frequently, although minor changes should be permitted, provided they do not affect the average rate for a period of years. Thus, if a railway system were permitted to charge an average rate of seven mills per ton-mile for a period of ten years, its officials should be comparatively free to raise rates on certain classes or commodities, provided other rates were correspondingly lowered. This would often be necessary in order to result in filling the cars both ways, as nearly as possible. The duties of railway commissions would thus be greatly simplified, while railways would have a powerful incentive to work out transportation economies. At the end of a prescribed period of years—ten, for example—a new average freight rate would be adopted, permitting the public to share in the results of economies effected, but not depriving the railway entirely of the results of intelligent management.

The public ownership of public service plants is a practice of questionable economy, except, perhaps, for certain limited classes of plant. The ever present danger of this method of control—even where the plant is leased to operating corporations—is the tendency to extravagant construction, which seems almost inevitable when the public purse is directly available. At present there is a strong leaning toward municipal ownership of street railways, lighting plants, etc., but this tendency is likely to change in a marked degree when it is found that public service corporations can be effectively controlled without absolute municipal ownership of the plants.

The first step in such control is complete publicity of costs of production and rates charged. This involves, however, a detailed appraisal of the first cost of the plant, for, as we have shown, a true cost of production includes interest on the actual cash cost of the property. Moreover, such an appraisal is also essential in determining what amount shall be placed annually in amortization or depreciation funds to provide for plant redemption at the expiration of its useful life. It needs but little acquaintance with engineering economics to appreciate that annual depreciation can be accurately estimated only in terms of the first cost. Incidentally, it may be added, such appraisals will, in future, assure the investing public that money alleged to have been spent in construction and equipment has been honestly spent. This, in turn, will serve to attract capital to investment in the bonds of public service corporations, and will have almost the same effect in lowering interest rates on bonds as if the construction work were done by government itself.

It is, indeed, not beyond the bounds of possibility that public service commissions will require that there be a public letting of all construction contracts. Already the Public Service Commission for the First District of New York State (New York City) insists upon supervisory control of all contracts involving the purchase of rolling stock.

Elsewhere in this issue we print a very interesting article on the appraisal of an electric interurban line, and syllabus of the decision of the Railroad Commission of Washington as to the passenger rates charged by this electric railway.

The Second International Road Congress.—Under the initiative of the Belgian Government, the second International Road Congress will be held at Brussels this summer, in order to continue the studies taken up at Paris in 1908 regarding the construction and care of roads with a view to adapting them to new modes of locomotion. This congress, at which the governments of the different countries have been invited to be represented officially, will be opened on July 31 and will last for seven days. It is organized by the Permanent International Association of Road Congresses, formed at Paris in 1908, at the time of the first congress, and by a Belgian Organizing Commission. Information regarding the conditions of membership can be obtained from Mr. Logan Waller Page, director, Office of Public Roads, Washington. It is expected that a few entertainments will be arranged at Brussels. There will be visits to the principal quarries of the country and a few excursions will be taken, including one to Antwerp, one to Spa and one to the caverns of Han-sur-Lesse. These excursions will give an opportunity to visit specially constructed roads, or installations in the matter of their adaptation to the new modes of locomotion. The organization of the Congress will be as follows:

SECTION 1.—CONSTRUCTION AND MAINTENANCE.

Subsection A.—Construction and Maintenance Outside of Large Cities.

First Question.—Macadamized and paved roadways. Use of binding materials in the construction of macadamized roadways. Use of running tracks in paved roadways. Progress of the struggle against dust and wear and tear.

Second Question.—Foundation and drainage of roads. Methods of work.

Third Question.—Construction of local railways and of tramways on roads. Advantages and disadvantages. Influence on the mode and cost of maintenance.

Subsection B.—Construction and Maintenance Within Large Cities.

Fourth Question.—Cleaning and watering. Necessity or usefulness. Means used. Net cost. Comparison with other processes.

Fifth Question.—Choice of the method of surfacing.

Sixth Question.—Way of carrying on street work, lighting and water supply.

Communications of the First Section.

Communication 1.—Use of mechanical rollers driven by petroleum engines.

Communication 2.—Equipment for roads exclusive of mechanical rollers, machines for breaking up the surface, etc.

Communication 3.—Materials of all kinds used in the construction and maintenance of roads; qualities to be demanded, tests on reception, units adopted.

Communication 4.—Laying sidewalks in cities.

Communication 5.—Removal of snow and ice.

SECTION 2.—TRAFFIC AND WORKING.

Seventh Question.—Influence of the weight and speed of vehicles on works of art.

Eighth Question.—Rolling stock on roads. Conditions to be fulfilled by a vehicle moved by animal or mechanical power in order to circulate on roads without causing abnormal deterioration and without undergoing itself any special injury.

Ninth Question.—Conditions of operation of transportation in common by land and with vehicles other than tram cars. Advantages, disadvantages, capacities, net cost, etc.

Communications of Second Section.

Communication 6.—Road signals. Steps taken to carry out the decision of the Congress of Paris.

Communication 7.—Different kinds of flexible tires. Utilization, advantages, disadvantages, etc.

Communication 8.—Census of circulation, of tonnage and of traffic; means employed and results obtained; units adopted.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Cost of the Concrete Balcony Floors of the Lockport Power House, Chicago Drainage Canal.

BY L. K. SHERMAN*

The reinforced concrete floors of the Lockport, Ill., Power House of the Sanitary District of Chicago were constructed by day labor under supervision of the writer, who was Resident Engineer of Construction.

The building, including the structural steel frame and columns of the balcony floors, was erected by contract and all of this work was practically completed at the time the reinforced concrete floor work herein described, was begun. There were two balcony floors, each 359 ft. long by 26.5 ft. wide. The steel supporting frame of the floors consisted of 18-in. I-beams, 26.5 ft. span, spaced from 4 to 10 ft. apart, with one end resting on the wall of the building and the other end supported by steel girders with columns at intervals of 38 ft.

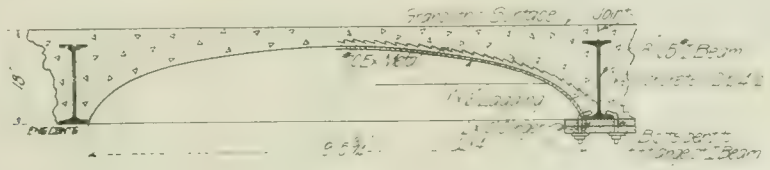

Fig. 1—Section of Balcony Floor Showing Forms, Lockport Power House.

Figure 1 shows a section of the floor, which is composed of concrete arches covering the spans between the 18-in. I-beams and supported by the lower flanges of the I-beams. The floor arches were 5 ins. thick at the crown, with elliptical intrados. The concrete was mixed in the proportion of 1 part Portland cement, 2½ parts limestone screenings under ⅛-in. size, and 4½ parts crushed stone ranging from ¼ to 1¼ ins. The floor surface was made with a "granolithic" finish of mortar composed of 1 part cement to 2 parts torpedo sand, placed from 1 in. to 1½ ins. thick. The granolithic surface was invariably placed before the concrete had an initial set, although this required night work of the finishers at times. Contraction grooves were cut in the floor above each I-beam.

The reinforcement consisted of 3-in. No. 10 expanded metal and was placed near the intrados of the arches.

The intrados, or ceiling, was pointed up, and given a wash of cement and limestone dust. The floors carry brick busbar compartments, heavy oil switches and the main switchboard. Openings were left through the floors for the passage of high voltage wires from the transformers. The total area of both floors is 19,000 sq. ft. The net area, deducting the openings, is 18,317 sq. ft.

Numerous lines of electrical conduit pipe were laid in the concrete floor during the work by the electrical contractors. This conduit work added materially to the cost of placing concrete and the necessity for co-operation with these contractors was one of the reasons for building these floors by day labor instead of by contract.

Forms.—Figure 1 also shows the form work. The elliptical ribs were made of 2-in. lumber and sawed out in the mill, and were placed at intervals not exceeding 3 ft. The lagging was 1x6 ins., dressed and matched flooring. Irregular openings were closed with sheet iron tacked onto the lagging. The ribs rested on stringers fastened to the bottom flanges of the I-beams by ¾x8-in. hook bolts. The forms for the entire first balcony were placed before any concrete work was started. After the first balcony had been concreted the forms were removed and used in the second balcony. The forms were made in sections 8 to 10 ft. in length. The following method was used in removing these sections from the first balcony and replacing them in the second balcony. A light scaffold was suspended under the form to be removed by four posts, each post being provided with ½-in. pulley block and tackle. A man stood at each post to operate the tackle. The scaffold was first hoisted up against the form. The hook bolts and supporting stringers were removed. The form then rested on the scaffold, which was lowered to the floor. The power house was equipped with a traveling electric crane, and with the crane the forms were hoisted on top of the finished floor of the first balcony. Then by means of the hoisting scaffold and posts, the forms were placed in position in the second balcony.

The final removal of forms from the second balcony was done by outside parties for the salvage on the lumber. An interior view of the Power House is shown in Fig. 3. The forms are in place in the first balcony.

Concrete and Finishing.—The mixed concrete (1-2½-4½) was purchased from the general contractor for the power house at $5 per cu. yd. at the mixer.

The concrete was hauled from the mixer to the elevator (see Fig. 2) in a 1½ cu. yd. Western dump car. The car was hoisted to the balcony floor, run out on a short piece of track and dumped on a receiving platform. The empty car then returned to the mixer. Concrete was carried from the receiving platform and placed in the work with wheelbarrows.

The mortar for granolithic surface was mixed in a box near the receiving platform. The cement finishers followed immediately after the concrete gang. The expanded metal reinforcement was placed on the forms and covered uniformly with about 2 ins. of soft concrete. The expanded metal was then pulled up from the form with hooks and shaken slightly, so that the mortar ran through the mesh and kept the reinforcing about 1 in. away from the lower surface.

The remaining concrete was then tamped in place. Some reinforcing bars were used about the floor openings. The work was done in February, March and April, 1907. Common labor received 17½ cts. per hour in February and March and 20 cts. per hour in April. During freezing weather heat was supplied with four salamanders burning coke. These fires were placed under the section of new concrete floor and canvass curtains were hung around, so as to confine the heat to the required section.

A typical force during the period of placing concrete work was as follows:

1 Foreman.
1 Motor man.
1 Car man.
1 Carpenter on reinforcing and minor form fitting.
1 Laborer on reinforcing and minor form fitting.
12 Laborers, wheeling and placing concrete.
2 Cement finishers on granolithic surface.
1 Mortar mixer on granolithic surface.
2 Mortar wheelers on granolithic surface.

Plant.—The hoisting and hauling was done with a Channon double purchase winch fitted with a 42-in. wood pulley and operated by belt from a 2 hp., 220-volt D. C. motor. Two motors were rented and one held in reserve in case of accident. A rather ingenious arrangement of hauling tackle was used. The ½-in. wire rope ran from the winch up to a snatch block located near the elevator (see Fig. 2) and back to the concrete car. The car was hauled from the mixer up an incline of 7 ft. rise and thence to the elevator landing. The car man then unhooked the car and pushed it onto the elevator and hooked the hauling line (which was removed from the snatch block) onto the end of the elevator hoisting rope. The hoisting winch was so placed that when the elevator was at the upper balcony landing then the coupling in the elevator cable was just drawn up to the drum of the winch. The hoisting rope was rigged to carry one-half the weight of the elevator. The speed of elevating was slow, but was sufficient to supply concrete as fast as it could be used.

Cost.—The cost of the work is given in the accompanying itemized tabulation. The total cost was $7,827.50, or 42¾ cts. per square foot. The engineer's estimate was $8,128. The only bid received was $11,000.

PLANT.

Elevator:	
Cage	$ 44.90
Guides, lumber	37.62
400 ft. ½-in. wire rope and fittings	26.25
3 16-in. sheaves	26.40
1 ½-in. snatch block	12.00
Labor	43.55
	$ 189.82

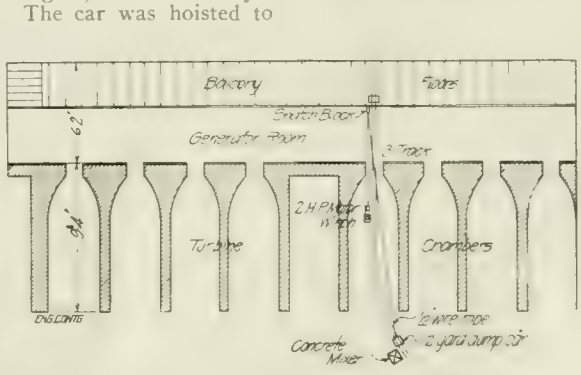

Fig. 2—Sketch Showing Lay-out of Concrete Plant.

Hoisting Winch:	
1 Shannon double purchase winch	$ 100.00
1 42-in. wood pulley	8.10
26 ft. 2½-in. rubber belt	2.86
Freight	7.00
Repairs and fittings	8.37
Labor placing	5.00
	$ 131.33
Salvage on winch	75.00
	$ 56.33
Electric Motor:	
Rent of motor, 2 hp. 220-volt D. C.	$ 25.94

*Assistant Chief Engineer, Sanitary District of Chicago.

Labor placing		5.71
Labor electrician		20.00
		$ 51.65
Electric Current: 6c hp. hour		76.58
Track:		
Rent of 300 lin. ft. rail, 30-lb.		$ 25.00
Labor on track		28.38
		$ 53.38
Grand total		427.76
Distribution of Plant Charge.		
To concrete, $427.76 × 85% =		$ 361.60
To granolithic surface, $427.76 × 15% =		66.16
Total		$ 427.76

COST OF BALCONY FLOORS.

Forms:	
Lumber.	
11,000 B. M. 1x6-in. D. & M. lagging at $25.00	$ 275.00
2,220 B. M. 2x10-in. S. I. S. stringers at $30.00	66.60
1,500 B. M. misc. rough lumber	28.19
316 ribs for 10-ft. span at 66c	208.56
99 ribs for 8-ft. span at 62c	61.38
48 ribs for 4-ft. span at 50.9c	24.42
	$ 664.15
Bolts, Tools, Etc.:	
1,000 ¾-in. hook bolts at 8c	$ 80.00
9 kegs nails	24.58
Sheet iron	15.15
Tools	9.85
	$ 129.58
Total form materials	$ 793.73
Labor.	
Building and Moving Forms:	
Foreman, 29 days at $4.00	$ 116.00
Carpenters, 39.5 days at $4.50	177.75
Carpenters, 51.1 days at $3.50	178.85
Carpenters, 110.2 days at $3.00	330.60
Laborers, 66 days at $1.75	115.49
Laborers, 17.3 days at $2.00	34.60
Craneman, 1 day at $2.50	2.50
	$ 955.79
Total, Forms	$1,749.52
Concrete:	
470 cu. yds. concrete mixed material in car at mixer at $5.00	$2,350.00
Tools	56.61
	$2,406.61
Labor Placing:	
Foreman, 33 days at $4.00	$ 132.00
Motorman, 45 days at $2.00	90.00
Laborers, 56.5 days at $1.75	98.83
Laborers, 180 days at $2.00	360.00
	$ 680.83
Plant Charge:	
See "Plant"	$ 361.60
Heating Concrete:	
4 Salamanders	$ 11.00
2,450 lbs. coke	12.24
6 12x30-ft. tarpaulins	54.60
	$ 77.84
Concrete total	$3,526.88

Reinforcing:	
19,734 sq. ft. 3-in. No. 10 expanded metal at 3c	$ 592.02
330 lbs. ½-in. cor. bars at 3c	10.51
585 lbs. ¾-in. rods at 2½c	14.63
Cutter and sledge	1.89
	$ 619.05
Labor:	
1 day, cement foreman at $5.00	$ 5.00
11 days, cement foreman at $3.50	38.50
2 days, motorman at $2.00	4.00
7.6 days, laborer at $2.00	15.28
	$ 62.78
Reinforcing total	$ 681.83
Granolithic Surface:	
Materials.	
260 bbls. cement at $1.72	$ 447.20
Cement hauling	21.33
90 cu. yds. sand torpedo	56.90
Sand freight	149.17
Tools	8.24
	$ 682.84
Labor:	
Cement finisher, 25.1 days at $5.00	$ 125.50
Cement finisher, 38.35 days at $3.50	134.22
Cement finisher, 20.05 days at $3.00	60.15
Cement finisher, 33.00 days at $2.25	74.25
Motorman, 11 days at $2.00	22.00
Laborers, 82 days at $2.00	169.00
Laborers, 46.4 days at $1.75	81.15
	$ 661.27
Plant Charge:	
See "Plant"	$1,866.16
Granolithic total	$1,410.27
Finishing Ceiling.	
Labor.	
Cement finisher, 49 days at $5.00	$ 245.00
Cement finisher, 57 days at $3.50	199.50
Cement and brushes	14.50
	$ 459.00

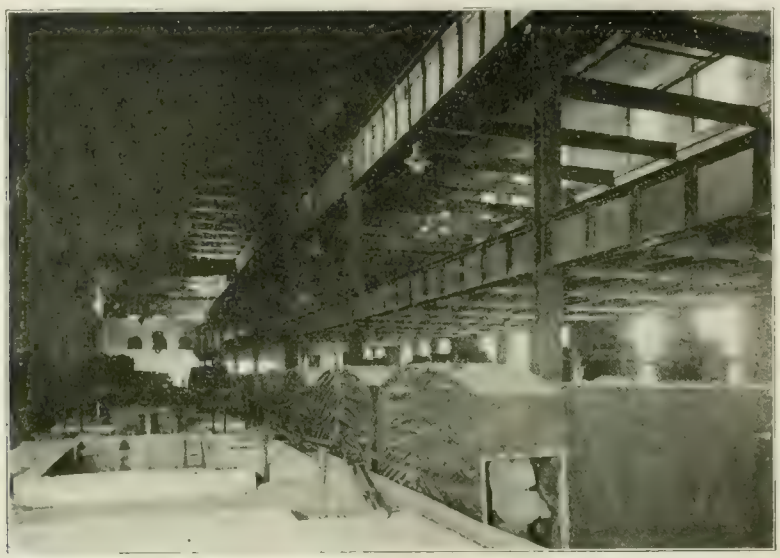

Fig. 3—Interior View of Lockport Power House Showing Balconies.

Some Notes on the Effect of Sewage and Sewage Gases on Portland Cement Concrete.*

The subject, the author stated, was one in regard to which it might be assumed that the available evidence was either inconclusive or of a more or less negative character. For, notwithstanding that cases were on record of destructive changes in tanks and sewers, the opinion tended to prevail that when the concrete construction was sound no marked disintegration need be anticipated, neither from sewage nor from its emanations. The author's experience did not support this view, and it was to the elaboration of this, the positive side of the question, that he desired to direct attention. During the last five or six years he had had very special opportunities for studying the problem.

In order to be in a position more fully to appreciate the disintegratory changes occurring at Hampton, and the deductions drawn from them, the author thought it was necessary to describe the installation in question, and to state the character of the sewage, as well as to outline the nature of the materials used in the construction of the tank and channels.

The Hampton Installation.—The nature of the sewerage system was water carriage, primarily flowing by gravitation, and, secondarily, raised by plenum pneumatic power. The sewerage was entirely and completely on the separate system. The installation consisted of a screening chamber, two detritus tanks, a hydrolytic tank, and triple-contact beds, and an air-purifying filter.

The sewage on its arrival at the works was delivered from the rising main into the screening chamber, and after passing through the screen, was conveyed by a channel to the detritus tanks. From these tanks the sewage entered the hydrolytic tank, which, together with the detritus tank, was installed in 1903. The disposition of the tank was such that the main bulk of the sewage—80 per cent—passed through at a comparatively high rate of flow, issuing in 4 hours as a clarified liquid, while the small volume—20 per cent—containing the deposited matters, was 16 hours in the tank. After flowing over the weirs of the first portion the liquid entered a channel which led to the second portion of the tank, consisting of four hydrolysing chambers arranged in sequence, and filled with large flint stones. The liquid having taken 3 hours in its passage through these four chambers, entered the lower channel, which conducted it to the contact beds.

The screening chamber, the tank, and the channels leading to and from the tank, as also the effluent channel of the primary contact beds, were covered in. The entire installation was ventilated by the hydro-mechanical system of sewer ventilation, and the withdrawn gases were purified by being passed through an air filter.

The sewage of Hampton was of a strong domestic character. It had undergone thorough disintegration by the lifting operations, and by the putrefactive changes occurring in the rising main. It was malodorous on its arrival at the screening chamber, where as it left the rising main, it evolved sulphuretted hydrogen and other bad-smelling compounds. The liberation of these gases constituted a nuisance necessitating the screening chamber, channels, and tank being covered in, and a means being provided for drawing a large volume of air through them before discharging the gases into the atmosphere.

The Concrete Used.—The whole of the tank and channels were constructed of Portland cement concrete. The walls of the tank are 6 ft. 6 ins. in thickness at the base, and 1 ft. 6 ins. at the top and are strengthened by tie-rods; the roof was 6 ins. in depth and was reinforced by "expanded metal," and the channels were covered by 2-in. "indurated" paving slabs. The work was executed by departmental labor, and the best materials were used.

The concrete was composed of 1 part of Portland cement properly mixed with clean water and 6 parts of balast thoroughly free from loam, clay, mud or dirt of any kind, and no material was allowed to be used larger than would pass through a 2-in. screen.

The makers of the "indurated" paving flags state that they are composed of Mountsorrel granite chippings, washed and crushed to pass through a ¼-in. mesh sieve, and heavy Portland cement made by themselves, the raw material for which is obtained from the Barrow-on-Soar blue lias beds. The materials are mixed in the proportion of 1 part of cement to 3 parts of granite.

Efflorescence.—Early in 1905, a few months

*Abstract in the "Surveyor" for April 29, 1910, of a paper by Sidney H. Chambers, engineer and surveyor to the Hampton Urban District Council, presented April 21, 1910, to the Concrete Institute.

SUMMARY.

	Total cost.		Cost in cents per sq. ft. of floor.	
Forms, material	$ 793.73		4.36	
Forms, labor	955.79	$1,749.52	5.21	9.57

Finishing ceiling		459.00	2.51	2.51
Total, 18,317 sq. ft.		$7,827.50		*42.75

*Cents.

after the hydrolytic tank had been put into use, it was noticed that the roof and walls of the hydrolysing chambers above the liquid level were white or yellowish in appearance. This efflorescence was not crystalline in structure, but was of a chalky subsistence, and resembled distempered work on a damp wall. On examination it was found to be due to a thin covering of sulphur, which could be easily removed by rubbing. Later the face of the walls and the roof in the second part of the tank showed signs of peeling, and the concrete appeared to be disintegrating. A thorough inspection of the installation was thereupon made.

Disintegration.—At the screening chamber nothing appreciable was observed, neither at the highest water level nor on the underside of the roof. The concrete was sound, and when struck had a good ring. Immediately adjoining this chamber was the main sewage inlet channel, along which the whole of the gases pass to the main air duct leading to the air filter. At this point slots were made in the concrete to receive a dam; the concrete at the back of the grooves was found to have disintegrated, although the sides were perfectly sound.

Further along this channel it was observed that the greatest disintegration had taken place on the walls at the liquid level. Owing to variations in the flow of the sewage, the level of the liquid in the tanks and channels rose and fell; thus a certain area of the walls was constantly being immersed in the sewage, and then exposed to the air. This area was, consequently, even when not immersed, much wetter than the part of the walls which was always above the level of the liquid. The latter area at this point showed erosion, which, however, had not penetrated so deeply as that at the level of the liquid itself. At the liquid level there was a deep groove in the concrete, and above this the face of the work had bulged out and lost its nature.

The first portion of the tank—*i. e.*, the hydrolytic tank proper—appeared to have suffered very little. The walls and roof had only the slight sulphur deposit. At the liquid level, which varied less than in the channel, there was a slight erosion. The second part of the tank—*i. e.*, the hydrolysing chambers—was found to have suffered in places to a marked degree. It was observed on breaking though the erosion on the surface that the concrete at the back was moist, soft and gritty. Also, it was noticed that increased dampness constituted an important factor in the destruction of the concrete, for the lower parts of the vertical faces of the beams supporting the roof were more affected than the upper parts. The lower portions of the vertical walls of the tank also were more eroded than the upper. At the liquid level the concrete had been severely attacked, and a deep groove existed in it.

Analysis of Concrete in Hydrolytic Tank.—Two samples of surface concrete were taken above and below the liquid level, and the following was the result of the analyses:—

	Below liquid level Sound.	Above liquid level. Unsound.
Appearance	Grey	White
Texture	Hard	Soft
Ratio cement to sand	1 : 2	3 : 2
Sulphate of lime in cement	Trace	66 per cent

Considerable Deterioration.—The same pronounced effect was to be seen in connection with the concrete blocks, which were grooved to receive sliding boards and project above the liquid level; these blocks had in many instances crumbled away to such an extent as to be almost shapeless. Recently these chambers were emptied, and it was found that the concrete below the liquid level was perfectly sound and in a good state of preservation.

The lower channel conveying the liquid from the tank to the contact beds revealed the same characteristics as were observed in the upper channel, but the portion at the liquid level was very much more markedly affected.

Analyses of the Disintegrated Concrete in the Channels.—Samples taken of the lining of the sides and covering gave the following analyses:

	Ratio. Cement.	Sand	Sulphate of lime in cement. Pct.
1. Concrete at varying liquid level	1	1	76.26
2. Underside of slab forming covering	5	1	74.61

The air duct taking the gases from the effluent channel of the primary beds and communicating with the tank outlet channel was found to have a coating similar in appearance to that observed on the underside of the covering to the channels.

Analyses of Concrete in Air Duct.—Analyses of this coating were made, with the following results:

	Ratio. Cement.	Sand.	Sulphate of lime in cement.
Underside of slab forming covering of air duct	2	1	70.71

Conversion to Sulphate of Lime.—The point to observe in the above analyses was the conversion of the lime in the cement into sulphate of lime, the sulphur being obtained from the sewage flowing through the tank and channels, as well as from the gases expelled from the sewage, and contained in the air withdrawn from the several parts of the installation.

Suggested Explanation.—Much thought had been given to the explanation of the foregoing observations, and it had been concluded that the effects had arisen from the putridity of the sewage and the oxidation of the putrid products by the air supply. The main erosive effect was at the varying liquid level, and was there dependent upon the amount of sulphuretted hydrogen in solution in the liquid. The gas was comparatively small in amount in the incoming sewage and in the liquid in the hydrolytic tank, and increased as the liquid passed through the hydrolising chambers. The results of this were especially well shown in the two channels; the alternate wet and dry area of the upper channel conveying the sewage from the rising main was less markedly affected, while in the lower channel the corresponding area was severely attacked. So with the two parts of the tank; the first part into which the sewage was delivered, and wherein comparatively little putrefaction took place, had not been affected to anything like the extent that the second part or hydrolising chambers had.

When the level of the liquid fell it left the concrete which it previously covered wetted with a liquid containing sulphuretted hydrogen in solution. This wet surface was then exposed to the action of the air supply, which oxidised the sulphuretted hydrogen with the production of sulphur and sulphuric acids; these decomposed the concrete, the lime being converted finally into sulphate of lime. What the exact nature of the intermediate compounds was could not be stated, as none of them had been isolated, but it was probable that the active agent was sulphurous acid, as it was known that cement was insoluble in sulphuric acid. When the liquid rose again, the decomposed concrete was washed away either wholly or in part, and a fresh surface was exposed to action when the liquid fell again. It was the continuation of this cycle which led to the formation of the grooves at the varying liquid level.

Concrete Above the Liquid Level.—The erosive effects on the concrete above the liquid level were dependent upon the sulphuretted hydrogen evolved from the liquid and mixed with the air supply. Some of this gas was dissolved by the moisture which was present on the walls and roofs, from evaporation and condensation; it was then oxidised by the air, and decomposed the concrete as described above. In this case the decomposed concrete either remained as a coating on the surface, peeled off, or crumbled away.

Effect on Concrete Tubes.—In order to observe the phenomenon on concrete tubes, two 9-in. concrete tubes were selected, which were supplied by the makers of the paving slabs previously referred to, and were composed also of similar materials in the same proportion. One of the tubes was coated with Dr. Angus Smith's composition (coal-tar, pitch, linseed oil, and resin). They were placed side by side in the second part of the tank in such a position that they would be subjected to the rise and fall in the level of the liquid. At low level the tubes were not in contact with the liquid, and at high level the liquid rose to half the diameter.

After the tubes had remained in the tank for eight months they were taken out and examined. The coated tube did not appear to have been affected, other than at the highest liquid level, where a thin line could be observed, and when struck it was found hard and had a good sound. It was noticed that there were two areas on this tube without any coating, due no doubt to its having been placed upon two supports to allow it to dry; these areas were soft on the surface and similar to the uncoated tube. With these exceptions the tube appeared to be in as good a condition as when first placed in the tank. On the other hand, the uncoated tube had a distinct line at the highest liquid level, which was found to be soft, and when tapped with a chisel had a dull sound; the interior of the tube which had been immersed appeared soft and had a dull sound when struck; the portion of the tube above the liquid level was unaffected, and when struck had a clear ring.

Conclusions.—The deductions to be drawn from the investigations were that the gases in solution in sewage, and those expelled from it, arising from its decomposition, do act injuriously upon Portland cement concrete, notwithstanding the fact that the concrete is constituted of sound and good materials, when the following conditions prevail:

(1) A high degree of putrescence of the sewage.

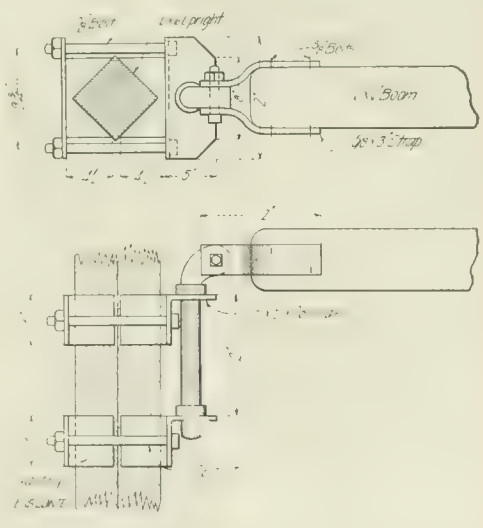
(2) A moistened surface, which held or absorbed the putrid gases.

(3) The presence of a free air supply.

Further, that in the absence of one or other of the above enumerated factors little danger from erosion need be feared.

Method of Attaching Derrick Boom to Leg of Hoist Tower for Concrete Building Work.

The use of towers for hoisting concrete from the ground to the various floors in con-



Sketch Showing Method of Shipping Derrick Boom to Tower Leg.

crete building construction is general practice. It involves, however, usually the provision of other means for hoisting form lumber, reinforcing steel, etc. In the construction of the large four-story buildings for the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., this separate hoisting element was a derrick, constructed by shipping a boom to one of the vertical legs of the tower. The special boom seat employed is shown by the accompanying drawings. It was designed by the contractor, the Aberthaw Construction Co., Boston, Mass.

Plant Cost of Machine Mixed Concrete.

The figures in the accompanying tables are compiled from the books of the Aberthaw Construction Co., who run ledger accounts for each individual concrete mixer. Table I. represents the debit charges against four mixers, numbers 2, 3, 4 and 6, with date of purchase and yards mixed. The yardage is approximate, but very nearly correct. The charges consist of the original cost, interest on same compounded annually to January 1, 1910, and all repairs. The inventory value on January 1 is deducted from the total cost.

Table II. represents the credits which consist of the rental charged different jobs during the time the mixers were employed on same. The rental rate is fixed by what it would cost to lease the same machine instead of buying it. Table III. is a comparison of Tables I. and II.

A careful analysis of these tables gives some very interesting information showing when it is cheaper for a contractor to rent his mixer and when cheaper to buy. For instance, it shows that a mixer should be in use at least 50 per cent of the time to make it worth while to buy. That it should be used sufficiently to be relegated to the scrap heap in from 6 to 7 years. That it is cheaper to buy outright where a machine is to be used on comparatively small yardage taking a relatively long period to place—sand or reinforced concrete buildings, etc. It is left for the reader to draw further conclusions from his own analysis.

Winnipeg Municipal Asphalt Plant.—Winnipeg has a municipal asphalt plant, established in 1899 at a cost of $14,000. Experimenting showed that the best mixture for wearing surface of an asphalt pavement was 10 to 12 per cent bitumen, 78 to 85 per cent sand, and 5 to 10 per cent pulverized limestone. The preparation for an asphalt pavement in Winnipeg is thoroughly made. The street is excavated 11 ins. Soft and spongy places are dug out and refilled with good earth, well rammed. Curbing is laid on grades and lines given by the engineer in trenches of the required depth, filled with broken, coarse, macadam stone. Upon the subgrade is laid a bed of Portland cement concrete 4½ ins. thick, made by first mixing dry and then making into a mortar one measure of cement equal to the best quality of Portland cement and three of sharp, clean sand. The binder course consists of broken stone and asphaltic cement, about fifteen gals. of cement to 1 cu. yd. of stone, the stone broken to ¾ in. The stone is heated by passing it through revolving heaters, and thoroughly mixed with the asphaltic cement. It is laid hot and rolled with hand and steam rollers. The average cost of paving the streets of Winnipeg with asphalt is about $2.30 per sq. yd. There are 58 miles of asphalt-paved streets in the city. During 1908 and 1909 extensive paving operations necessitated the maintenance of 125 men at the plant and 75 men on the street during the busy season.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Method and Cost of Constructing a Water Supply Tunnel Through Rock by Day Labor With Costs of Supplementary Structures.*

The work described comprises a tunnel 4 ft. x 5 ft. 10 ins. in section and 4,819 ft. long, a gate house, intake pipe, and culverts and roads. All were constructed by day labor and from a part of the new $500,000 water supply works for the city of Fort Williams, Ontario. The several structures are shown by the drawings, Figs. 1 to — inclusive.

Construction Camps.—The main camp was located about midway between the tunnel portals, approximately 800 ft. south of the center line, at an elevation of 180 ft. above Loch Lomond. All buildings were constructed of a double thickness of 1-in. ship lap separated by tarred felt, and the roofs covered by three-ply pyroid roofing felt. Brick chimneys were used throughout. Wood burning box stoves were provided, and the stove pipes were conducted as far as possible within the buildings.

The main boarding and bunk house was of two stories, 86x18 ft., with a wing 32x29 ft. There were 64 bunks in two tiers, divided into 8 rooms, so that the various shifts could be kept separate and suffer a minimum of disturbance. A wash room and smoking room were provided for each floor. The dining room was 29x24 ft., and seated 50 men. Additional accommodation was provided for the kitchen staff. A 31x14-ft. stable, with hay loft, and an 8x16-ft. ice house were also provided. Adjoining the main boarding house, a compressor house was built, 38x18 ft., a portion of which was used as a machine repair shop. A bungalow was erected further up the hill near the camp, containing three rooms each 10x12 ft. for the accommodation of the engineering staff. Special care was taken as to the cleanliness of the camp. Garbage was burned periodically, and pail system latrines were built at the camp, at the shaft, and at the forebay. At both ends of the tunnel, blacksmith shops, 12x21 ft. were erected, as well as two drying houses for the accommodation of the men changing shifts. Each of the latter contained a room, 14x12 ft., surrounded by 12-seat lockers, 3x2x2 ft., and provided with drying racks, and a hot water boiler. Adjoining was a 12x7-ft. store room. Two magazines, 10x12 ft. were erected in near-by locations, shut off from the work by high bluffs. Small thawing "dugouts" were built close to the work. In each was placed a galvanized iron box of 26 gage metal, surrounded on all sides, except the front, which was provided with a door, by a 4-in. water jacket; the enclosed space was divided and bracketed for tiers of trays, on which the dynamite rested, accommodation being provided for two cases (100 lbs.). This box was mounted on a sheet-iron cylinder, in which was placed an electric heater, fed off the lighting circuit, which developed a heat sufficient to keep the water jacket at a temperature of 70° in weather 45° below zero. Thawing was more or less necessary during eight months of the year, and the heat was adjusted by increasing or decreasing the number of coils, in accordance with the season.

All buildings were lighted by electricity on a single phase, 110-volt circuit, transformed at three points by three 2½ kw. transformers.

A water system was installed throughout the main camp, and supplied through a 1-in. pipe by a small Fairbanks pump located on a creek about 500 ft. from the camp, and operated by compressed air tapped from the main receiver.

A magneto telephone system was installed with stations at the north portal, the main camp, and at the shaft. A switch in the main camp enabled either of these points to be directly connected with the switchboard in the City Telephone Exchange.

Power.—Steam was practically out of the question for this purpose. Coal must first come from Pennsylvania, and then be hauled seven miles over a road that took many months to get into passable condition, and had some hills with 15 and 20 per cent grades. The local supply of wood was limited, and although used only for heating purposes, had to be hauled more than three miles before the close of the work. Gasoline figured out at over $100 per hp. Electric power at $25 per hp. was available on the north side of the river, and it was decided to build a power line, although, unfortunately, the price of copper was at the time abnormally high. The current used was supplied by the Kaministiquia Power Co. from their hydraulic plant at Kakabeka Falls—at 2,200 volts, three phase, 60 cycles alternating current. Poles, 35 ft. in length, were secured from the surrounding country, and spaced 150 ft. apart. Two four-pin cross arms were used on each pole, the lower arm carrying telephone lines. The wire was No. 6 solid weather proof copper, running 112 lbs. per 1,000 ft. The river was crossed by a lead-covered submarine cable of No. 6 copper, laid just within the trench dredged for the west pipe crossing. This cable remained undisturbed for nearly two years, after which it was a constant source of trouble. The first break, early in November, 1908, was caused by a dragging ship's anchor, and nearly five weeks elapsed before a new cable could be secured. The cable was so buried that only 100 ft. could be salvaged, after three days' work with scow and diver. The following temporary expedient was adopted to replace it. Three lines of ordinary W. P. stranded copper wire, heavily taped, were bound together. The cable thus formed, was passed through eight lengths of 2½-in. fire hose, and lowered to the bottom with fish plates, lead pipe, and other weighty debris. This worked well for two weeks, when another boat hooked the hose and punctured the rubber. It was taken up and dried, and again laid for a further run of five days. This performance continued until the arrival

*Rearranged from a paper by H. Sydney Hancock, Jr., presented to the Canadian Society of Civil Engineers.

of the new cable, shortly before the close of navigation. On the opening of navigation during 1909, the water level of Lake Superior and the Kaministiquia River was about 2 ft. below normal, and the first boat down the river scraped the cable so that it had to be raised and dried. About two weeks later one wire went dead, and it was thought inadvisable to attempt to dry it again; consequently, one of the taped wires previously used in the fire hose, was strung through a 1-in. lead pipe and connected at the shore ends. No further trouble has been experienced.

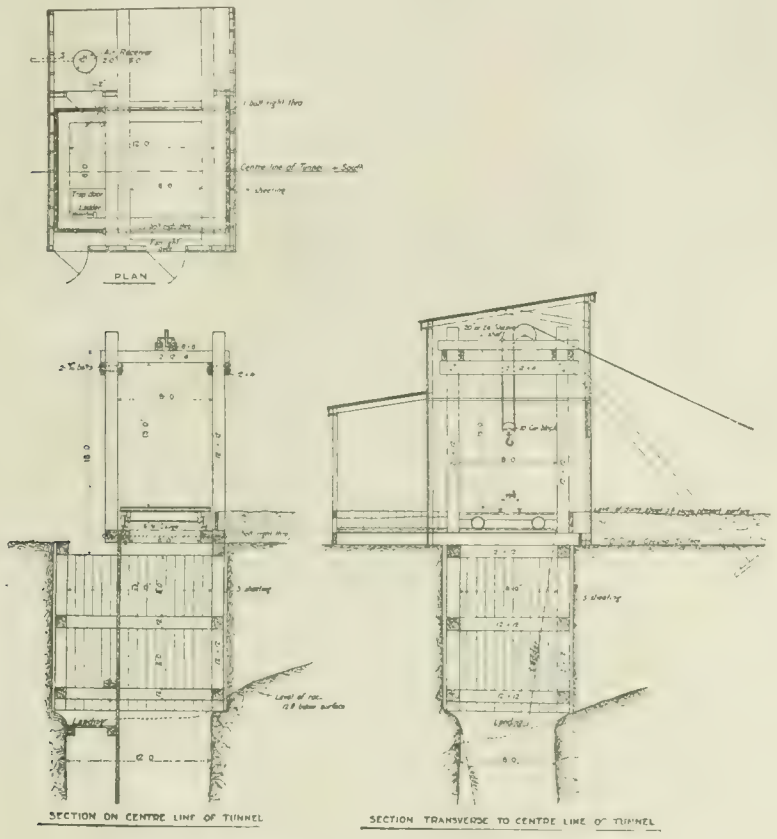

Fig. 1—Details of Shaft Construction.

The cost per mile of the transmission line, excluding telephone, was as follows:

3 miles, 1,770 lbs., No. 6 wire, at 28 cts.	$495.60
35 poles in place, at $5	175.00
35 4-pin cross arms, at 41 cts.	14.35
105 birch pins, at 2½ cts.	2.62
35 cross braces, at 8 cts.	2.30
105 double petticoat insulators, at 4 cts.	4.19
Freight, at $1.20 per 100 lbs.	24.00
Labor stringing wire	30.00
Total per mile	$748.47

The total expenditure on the line was as follows:

7 miles completed line, at $748.47	$5,239.29
Cable and work at river	358.20
Alterations and repairs	317.00
Repairs and renewals on cable	580.00
Total	$6,394.49

The alterations were due to the necessity of three times changing the four-pole construction crossing the C. P. R. property to accommodate increased trackage, and of moving the line from the vicinity of a particularly heavy rock cut in the second pressure main.

Plant.—A class E straight-line belt-driven Rand air compressor, capable of compressing 282 cu. ft. of free air per minute to a pressure of 100 lbs. per sq. in., was erected at the main camp. This compressor was operated by a 50 hp. Westinghouse induction motor, through three 15 kw., 2,200 volts to 550 volts, transformers. A 4-in. air pipe, fed by a 36-in. 8 ft. receiver erected in the compressor house. From this air receiver 3-in. wrought-iron pipes, with a union joint every 200 ft., led to the shaft and north portal. At these points were placed 24 in. x 6 ft. air receivers, from which 2-in. pipes served the various headings. The 3-in. pipe was carried on the surface of the ground, blocked up where necessary to secure a continuously falling grade. Serious trouble from frost not being anticipated, the expense of excavation in a rocky country was avoided. During continuously cold weather, with temperatures near the zero mark, no trouble occurred, but, at almost every mild spell, work was temporarily stopped by frozen air pipes, a cold night, after a comparatively warm day, being the chief cause. It was not feasible to cover the whole line with snow, owing to its height above the ground when crossing small ravines. To overcome this difficulty, drip cocks, threaded to take a small pressure gage, were placed every 300 ft. along the line, and a supply of wood and coal oil kept at numerous points. When a block occurred, a gage inspection revealed the 300-ft. strip affected, and an hour's work or less usually sufficed to thaw it out.

The drills used were No. 43 Rand "Little Giant" drills, with 3-in. cylinders, mounted on 6-ft. double screw mining columns, and fed through 50 ft. of 1-in. Monarch hose. Black Diamond steel, with regular cruciform bits, were employed at the commencement of the work in the comparatively soft rock, but the change to the hard black basalt necessitated the use of the best grade drill steel, manufactured by the Jessop and Edgar Allen Companies.

The track was of 50 cm. gage, 12-lb. rails, 15 ft. long, laid on 4x6x30-in. ties, spaced 30 ins. c to c. The curves and switches were made of Koeppel portable track on steel ties. The four cars at the north portal heading were Koeppel all-around dump cars of 18-cu. ft. capacity, and at the shaft headings eight detachable body-side dump roller-bearing Koeppel cars of similar capacity were used. A five-inch double cylinder Jenckes hoist, operated by compressed air, with a 6x24-in. drum winding a ½-in. steel wire rope, was erected at the shaft. The shaft sump was drained by a Cameron pump, with a 3-in. suction and 2-in. discharge, rated at 100 imperial gallons per minute and operated by compressed air. Buffalo forges were used at each end, but the centrifugal blowers were replaced by a compressed air nozzle.

Ventilation was secured by two belt-driven blowers, with 12-in. blades operated by 2 hp. Westinghouse motors, fed from the lighting circuit and delivering air through a 5-in. pipe made up into 20-ft. lengths of 24-gage galvanized iron. The dry, hard nature of the rock in the north shaft heading caused much inconvenience from dust, and necessitated the use of a spray, which was furnished from the shaft pump through a ¾-in. wrought-iron pipe.

Light was provided by a single-phase 110-volt circuit, through No. 12 weather-proof wire, from which 16 c. p. lights, protected by wire guards, were dropped every 75 ft. The "breast" work was lighted by a heavily guarded 32 c. p. lamp, furnished with socket handle and hook, and attached to 100 ft. of rubber-covered extension wire.

Tunnel.—The smallest cross-section, consistent with reasonable progress during construction, being more than sufficient for the contemplated water supply, the minimum finished dimensions were specified to be 4 ft. x 5 ft. 10 ins., carried at a grade of 1 in 1,000. It was the original intention to line the whole tunnel with concrete, varying in thickness with the nature of the material excavated, but, finally, only those portions showing any sign of weakness were so treated. The generally close, hard nature of the rock removed all fear of seepage or erosion, and the use of a very high coefficient of roughness still brought the delivering capacity of the tunnel considerably over any possible discharge that could be secured from the watershed.

The rock was excavated on a minimum cross-section, 6 ft. 6 ins. high by 5 ft. wide, and all weak sections lined with 1:2½:5 concrete, leaving a clear waterway, 4 ft. wide and 5 ft. high, to the springing line of a segmental arch of 4 ft. span and 10-in. rise. Work was carried on at three headings with three machines, two working north and south from the shaft and one working south from the north portal.

Shaft.—The shaft was 60 ft. in depth and 12 ft. x 8 ft. inside dimensions. Four sets of 12 x 12 in. timber, 6 ft. c. to c., backed by 3-in. sheeting, brought the excavation to solid rock. The shaft was divided into two compartments by 2-in. plank casing, the hoisting compartment being 8 ft. x 8 ft., and the ladder, pipe, and wire compartment 3 ft. 9 in. x 8 ft. Three "rollers" or landing platforms were provided in the latter, making three 16-ft. stages and one of 12 ft. The shaft was sunk by hand labor, prior to the arrival of the machines, at an average rate of 1 foot per shift. An ordinary "jack roll" was used as a hoist.

The head gear was carried on four 12 x 12 in. posts, braced against the hoist by 12 x 12 in. struts. A 24-in. sheave was supported on two 8 x 8 in. timbers, bolted to four 4 x 12 in. cross-timbers, which were again supported by four 4 x 12 in. timbers, secured to the posts by ¾-in. bolts, and a shaft house of 1-in. lumber covered the erection at the collar of the shaft. Stringers, 12 x 12 in., to each of which was spiked a 40-lb. rail, formed a track of 6 ft. 9 ins. gage, on which ran a platform car fitted with a section of track 19⅝-in. gage of 12-lb. rail.

The cars used in the shaft drills were the Koeppel steel side roller-bearing dump cars with detachable bodies. To the hook of the gin block was attached the Koeppel crane attachment. When the cars were brought to the shaft, the bodies were hoisted clear of the trucks to the pit head. A duplicate truck was then run in on the platform car over the shaft, the body car lowered into position, and the platform car run clear to a point where the dump track joined the platform track. The full dump car was then pushed on to the dump track and replaced by an empty car standing on the adjoining "empties" switch, the platform run over the shaft, and the empty car body attached to the crane. On the removal of the platform, the car body was lowered to the vacant truck awaiting it. The full car was then dumped by the "lander" and returned to the "empties" switch. Under ordinary circumstances, this method would have proved cumbersome, but the uniform hardness of the rock in both shaft headings reduced the quantity of material to be handled to the capacity of one "mucker," and as the "landers" soon became "speedy" at their

work, this method of hoisting rendered satisfactory service.

The alinement was transferred down the shaft on an 11-ft. base line by 12-lb. plumb bobs attached to fine piano wire and resting in buckets of water. A transit was then set up in line with the wires and the line produced. This operation was repeated several times whilst the drifts each made 200 ft. of progress, and, finally, a centre line 300 ft. in length was established on the mean of the five middle readings.

When the south heading was driven through, the alinement was checked by setting up on a hub near the shaft and back sighting 700 ft. to a hub set from the surface at the south portal. The error at the breast of the drift heading north was found to be 1¼ ins., and was corrected by subsequent operations.

At the north portal Koeppel steel all-round dump cars of 18 cu. ft. capacity were also used, the steep hillside affording ample dumping ground for the whole work within a haul of 200 ft. from the portal.

The cars were all pushed by one man, and over distances of approximately 1,000 ft. Bye-passes were excavated and a switch installed so as to reduce the haul of the mucker at the breast to that limit. A small Koeppel flat car was provided for handling machines and tools for each drift.

Owing to the scarcity of capable machine men, the work was at first carried on by two 10-hour "shifts," but as men became available, three 8-hour "shifts" were organized. A "shift" consisted of one machine man and his helper, and from one to three muckers, depending on the length of haul and character of the work. Two blacksmiths, one at either end, each worked from 10 to 14 hours, varying with the hardness of the rock and the quantity of outside work. The hoistmen and landers at the shaft, as well as the compressor men, worked in two "shifts" of 12 hours. The track-laying, pipe-laying, light extensions, machine and general repair work was handled by two men working usually 10 hours.

The first 1,200 ft. of the north heading consisted of a compact blue volcanic ash slate that drilled and broke well, and through which good progress was made. The remainder of the tunnel was through a tough, hard trap, containing numerous diorite dykes of phenomenal hardness, the specific gravity of which frequently reached 3.4.

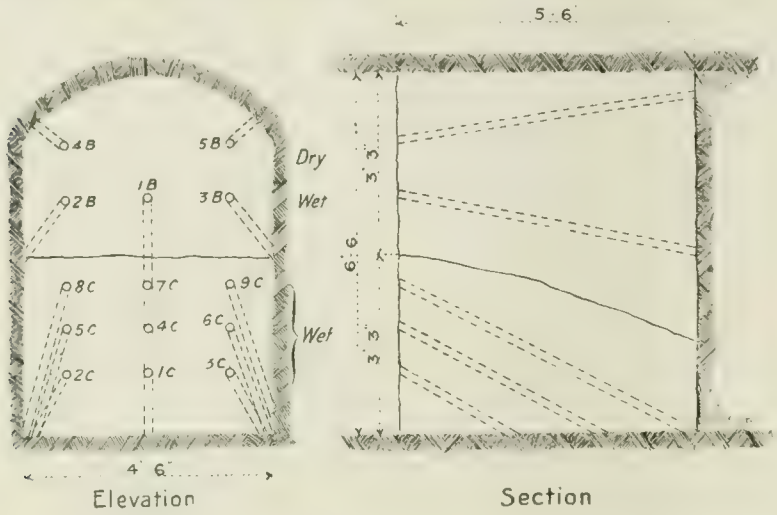

Fig. 2—Arrangement of Drill Holes in Average Rock.

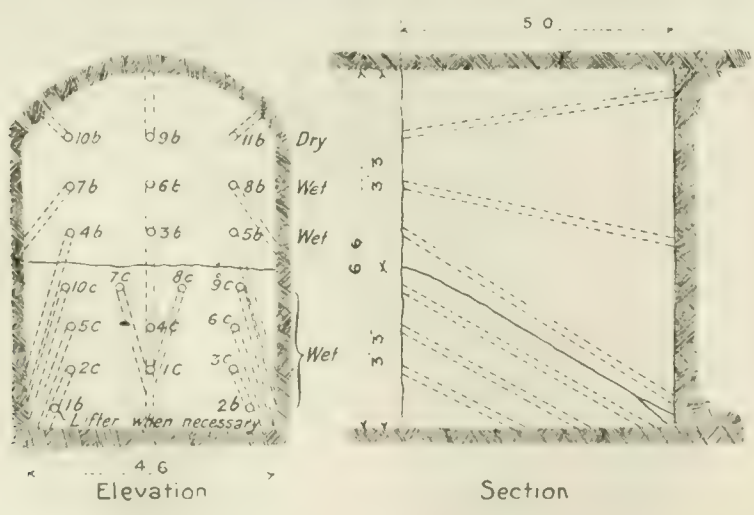

Fig. 3—Arrangement of Drill Holes in Hard Rock.

Progress through the latter rock was painfully slow, although air was delivered to the machines at from 80 to 85 lbs. pressure. Bits of the best steel, tempered to a pitch that would notch a file, were worn smooth and useless without crack or flaw after drilling less than 3 ins. It frequently took over three hours to drill a 5-ft. 6-in. dry back hole.

The machines were mounted on standard vertical mining columns with two jack screws, the small size of the drift preventing the use of a horizontal bar.

The average advance made by each cut was 4 ft. 6 ins. In the slate rock eight 5-ft. holes sufficed, the whole breast being fired in one blast, but the tenacious nature of the hard rock sections necessitated from 17 to 22 holes, in order to break the full cross-section. The holes were arranged as shown in the sketch (Fig. ..) and the lower nine holes forming the "cut," were fired first with a fuse, timed to explode in the order shown. After the "muck" had been cleared, the "back" holes were similarly fired.

The upper five holes in the back were practically "dry" holes, and proved a very hard drilling proposition in this rock. Two lifters were sometimes used at the bottom of the face to serve the double purpose of striking to the bottom of the cut, and lifting the "muck" away from the face, thus facilitating the speedy erection of the columns for the next attack.

Work commenced with 60 per cent dynamite, manufactured by the Ontario Powder Co., but the fumes proved too much for the miners, who were constantly being overcome by gas, and 40 per cent dynamite was substituted with satisfactory results. When the very hard rock was encountered, the writer believed that a stronger explosive would be advantageous, and Nobel's 75 fumeless gelignite was adopted. After some trouble in getting it properly thawed, and the holes intelligently loaded, the results secured were good, but its odor, to which the "copper country" miners, who were in the majority, were unaccustomed, caused much vomiting and the experiment had to be abandoned. In the slate rock, about 6 lbs. of 40 per cent dynamite were used per foot of completed tunnel, but in the hard rock it was necessary to use from 12 to 18 for the same distance.

In the slate rock firing by battery was more or less successful, but in the hard rock, time fuse gave infinitely better results. The "Bennet" fuse was used throughout the work and proved of uniform excellence.

Two accidents marred the success of the work. One on June 21, 1907, and the second on June 21, 1908. On the first date the two shaft drifts had each been driven less than 40 ft., the ventilating fans not being then in position. Immediately after the midnight blast the two miners in charge of the shifts went down to recharge a missed hole, expecting to get away before becoming affected by the fumes. The air hoses were coiled on

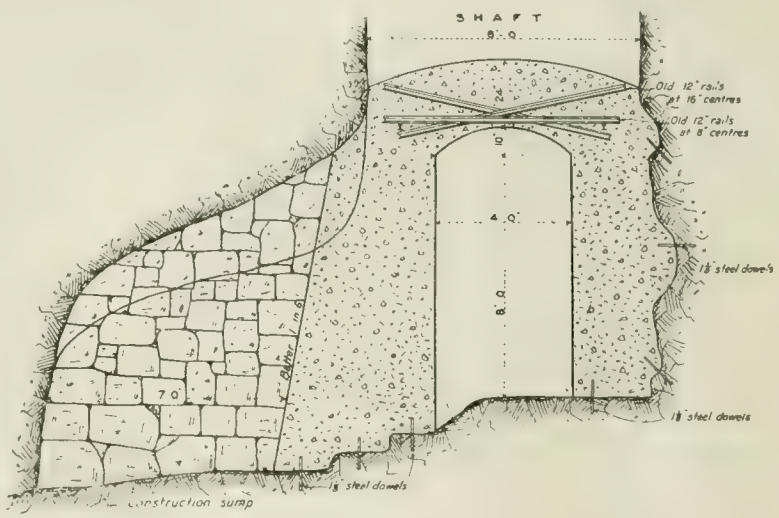

Fig. 4—Construction of Tunnel at Foot of Shaft.

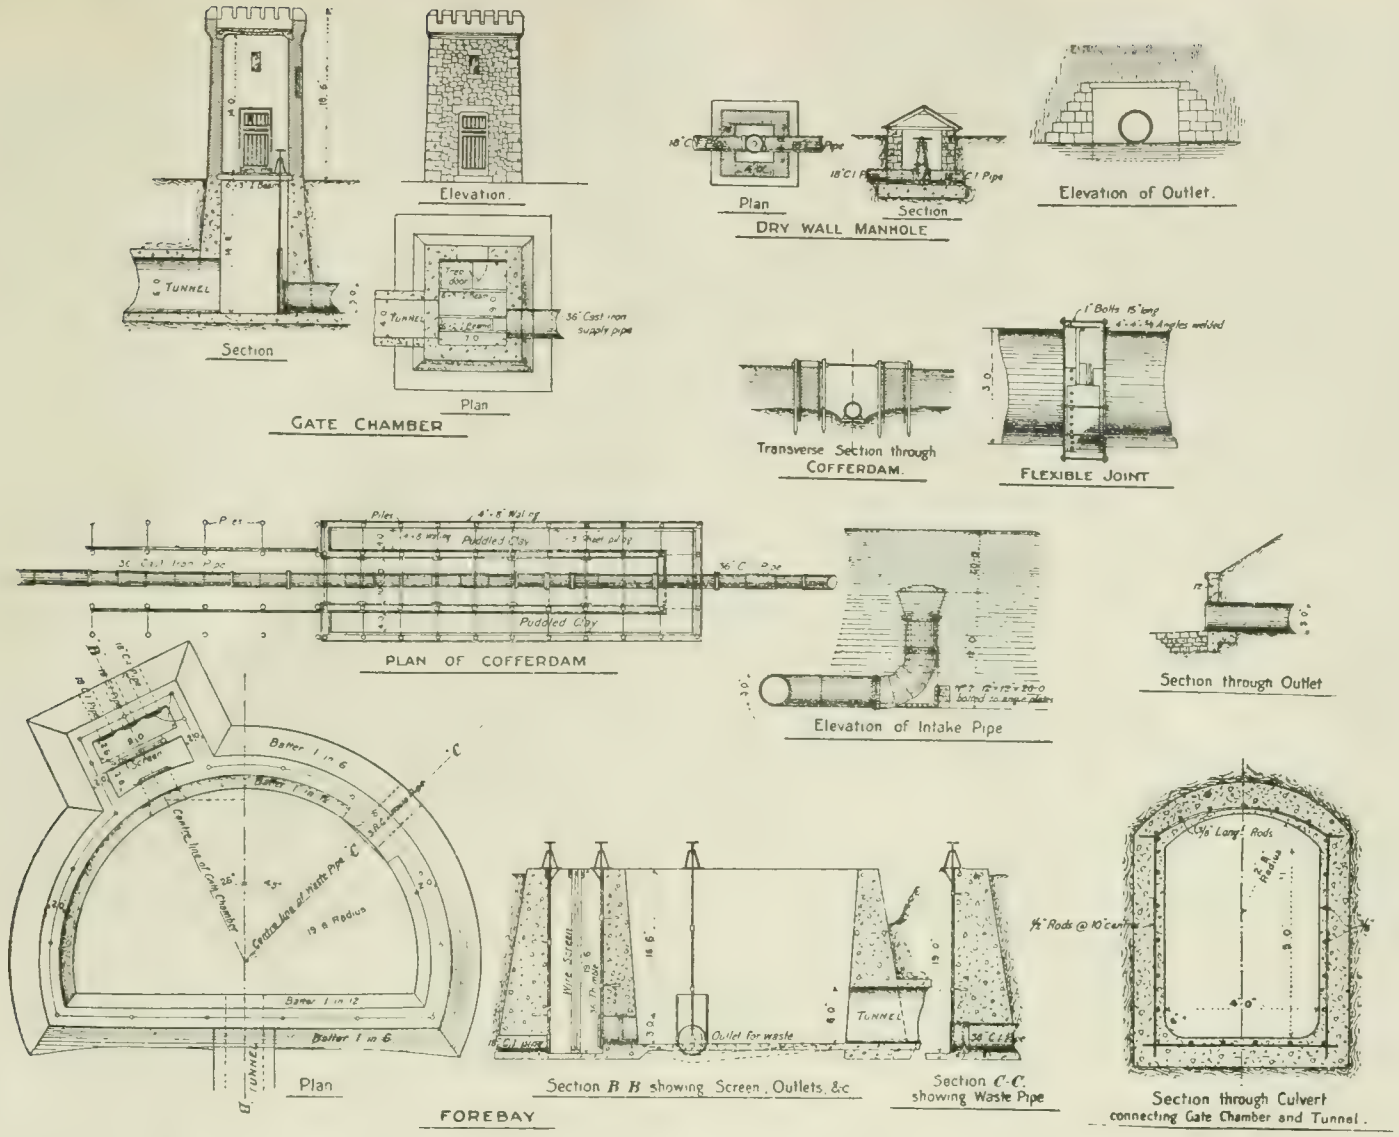

Fig. 5—Details of Gate House, Intake Pipe, Forebay and Culvert.

the lower "soller," and the precaution of blowing out with compressed air was not taken. Apparently both men were overcome immediately on reaching the bottom ladder, as one sustained a broken arm from the fall. A rescue party of two men from the surface placed the unconscious miners in the bucket, and then attempted to climb out, but both collapsed on the lower "soller." The casing had not been completed in the ladder compartment, so they were hoisted to surface by the bucket. One man, and he the most active of the rescue party was already dead from the effect of the fumes and the effort of carrying a collapsed comrade up the first ladder. His name was Jos. Chichester, the son of Colonel Chichester, a distinguished British veteran of the Indian Mutiny.

Within a few minutes of one year later, a mucker in the north heading, while cleaning up in preparation for the blast, turned up a small piece of dynamite 8 ft. from the face. On being advised, the man left his machine and began to search with a pick for further fragments, thereby immediately causing an explosion. Both the machine man and his helper were killed and one mucker was permanently blinded, the other standing beside his car, 6-ft. away, was uninjured. The amount of dirt moved did not exceed 1 cu. ft., but the whole quantity was apparently received in the faces and chests of the victims. Neither the air hose nor the light wire were damaged, and the incandescent globe hanging from the column, only 5 ft. away, was uninjured. Subsequent examination pointed to the probability that the explosion of No. 3 cut hole had cut off No. 6, drilled in this case a few inches below grade, and leaving an inch or two of dynamite in the bottom of the latter hole. An extraordinary feature of the case was that this was the third time the hole had been mucked over, and as half of it showed plainly on the side of the drift it had been examined two days previous to the accident.

The machines commenced work on June 4, 1907, and the two long headings met on May 24, 1909. The closing error in alinement amounted to ⅜-in., and the difference in elevation was 0.05 ft.

After the tunnel had been cleared out and concreted where necessary, the shaft was covered 8 ft. above grade line by a 24-in. slab reinforced by old 12-lb. steel rails, supported on walls 4 ft. apart keyed into rock at the sides with 1⅛-in. drill steel. At the sump, the wall was made 3 ft. wide on top, battering on the outside at 1 in 6. The whole shaft was then filled to the surface with earth.

The monthly progress in the three drifts was as follows:

Month,	North Portal Drift.	North Shaft Drift.	South Shaft Drift.	Total
1907.	ft.	ft.	ft.	ft.

The wages paid on the tunnel were as follows:

Tunnel superintendent, per month	$150.00
Machine men, per shift	3.50 to 4.00
Helpers, per shift	3.00 to 3.50
Muckers, per shift	2.50 to 2.75
Landers, per shift	2.50
Hoistmen, per hour	.25
Blacksmiths, per hour	.35 to .40
Blacksmiths' helpers, per hour	.25
Compressor men, per hour	.25
First mechanic, per hour	.40
Mechanics' helper, per hour	.30

*Half month lost by power cable troubles.
†Labor and machine troubles.

The cost in detail was as follows:

North Portal Drift (labor), 2,225 ft.	Per ft.	Total.
Machine men	$ 3.02	$ 6,816.55
Helpers	2.48	5,587.95
Muckers	2.84	6,404.30
Blacksmiths	2.06	4,655.22
Mechanics	.40	895.45
Tracklaying and trestles	.77	1,725.55
Powder and miscellaneous	.35	787.91
Total	$11.92	$26,873.53
North Shore Drift (labor), 1,798 ft.:		
Machine men	$ 3.41	$ 6,137.65
Helpers	2.72	4,893.37
Muckers	2.34	4,207.89
Landers	1.47	2,640.61
Hoistmen	1.44	2,598.94
Blacksmiths	2.07	3,715.13
Mechanics	.47	839.75
Track and trestle	1.04	1,866.38
Powder man and miscellaneous	.57	1,028.91
Total	$15.73	$27,928.63

South Shaft (about 766 ft.)		
Machine men	$ 2.93	$ 2,248.30
Helpers	2.32	1,780.92
Muckers	1.95	1,495.79
Landers	1.95	727.56
Hoistmen	.99	759.84
Blacksmiths	1.67	1,278.83
Mechanics	.30	229.85
Track and trestle	.74	561.87
Miscellaneous	.37	282.66
Total	$12.23	$ 9,369.62
General Tunnel Maintenance (labor), 4,819 ft.:		
Compressor men	$ .85	$ 4,102.75
Mechanics	.32	1,541.75
Wood thawing, etc.	.37	1,762.60
Miscellaneous labor	.36	1,733.35
Total	$ 1.90	$ 9,140.45
Grand total	$15.42	$73,312.23
General Tunnel (material):		
Drill steel	$ .46	$ 2,240.00
Explosives	2.14	10,302.50
Fuse	.13	640.20
Caps	.04	173.00

Dues on timber	.02	108.15
Fan, motors, electric supplies	.18	847.85
Machine repairs	.67	3,234.78
General hardware, pipe and comp. rep., etc.	1.54	7,397.96
Total	$ 5.41	$26,053.63
General Tunnel Charges:		
Power	$ .56	$ 2,693 37
Power line	1.32	6,394.49
Teaming supplies	.50	2,406.55
Employers' liability insurance	.61	2,933.63
Accident expense	.06	296.50
Sinking shaft	.69	3,328.55
Plant and machinery hauled and erected	3.38	16,300.00
Camp buildings	.83	4,019.00
Fire insurance	.06	301.21
Trimming and cleaning out tunnel	.61	2,919.20
Concreting shaft and shattered sections	.22	1,069.45
Sundries, livery, scavenging, etc.	.09	447.00
Total	$ 8.94	$43,108.95
Superintendent, time keeping, etc.	$ 1.45	$ 6,974.09
Engineering	.70	3,370.00
Legal, by-laws, etc.	.08	390.00
Total	$ .78	$ 3,740.00
		$ 79,876.67
Total	31.80	153,188.90
Less salvage plant	1.50	7,200.00
Net cost 4,819 ft.	30.30	145,988.90

The whole cost of the camp buildings has been charged to the tunnel, although the boarding camp was partly used by men on other work. This other work, however, did not justify such a building, and at times the men so engaged were accommodated in tents, as everything was subordinated to the interests of the tunnel.

Captain John King, of Hancock, Mich., was engaged as tunnel superintendent in March, 1907, and continued in that capacity until the completion of the work.

Roads.—About 4½ miles of road were constructed in connection with the tunnel section through difficult country, embracing rock, swamps, muskeg, and steep sidehill work. A road 14 ft. in width was finally constructed with a smooth gravel surface, but to secure this result sufficient material for an average fill of 15 ins. throughout its length had to be hauled from four gravel pits, located at intervals of about 1 mile along the road, and a surface ditch 2 ft. in depth excavated on the upper hillside. Some 500 ft. of corduroy were necessary, as well as two small bridges of 16-ft. span and numerous log culverts. About one mile was macadamized with rock from the tunnel spoil bank.

With labor at 25 cts. per hour and teams at 50 cts., the cost of this work was as follows:

Team work	$1,140.00
Labor	5,268 10
Bridges and culverts	350.00
Total	$6,858.10

Concrete Culvert.—The south portal of the tunnel was located at Station 1+90, from which point an open cut was excavated to the gate house at Station 0, some 50 ft. from the lake shore. The excavation consisted largely of solid trap rock and very large boulders, with various strata of sand, quicksand, and gumbo. A creek, discharging after rain as much as 5 cu. ft., crossed the line at Station 1+00, and was diverted by an extensive channel change parallel to, and 50 ft. distant from, the center line.

A culvert of reinforced concrete was then constructed, connecting the tunnel with the gate house, the dimensions conforming to that of the lined tunnel, viz., 4 ft. in width inside dimension, with vertical walls 5 ft. high to the springing line of a segmental arch of 2 ft. 8 ins. radius. The floor and walls were 10 ins. thick at the crown. Transverse reinforcing of ½-in. round steel, spaced 10 ins. c to c., was used throughout, the ends being bent so that the wall reinforcing hooked into the ends of the floor rods, and, in turn, the curved arch rods hooked into the ends of those in the walls. Longitudinal reinforcing of ⅜-in. steel rods, spaced 10 ins. c to c., was wired to the transverse reinforcing in arch and floor. The foundation was largely rock, intersected by pockets of sand, gumbo, and quicksand, and where the latter were too extensive to be filled with rock, the walls were supported by a reinforced foundation slab 9 ft. in width and 12 ins. thick.

The concrete was proportioned as 1:2:5, Star Portland cement being used. Sufficient sand was secured on the adjoining lake shore by team or boat haul, and stone of from ½-in. to 2-in. size was secured, after double screening, from the spoil bank at the shaft.

When completed, the excavation was backfilled to natural ground level, and a space of about 2 acres in extent, adjoining the gate house, graded level. The excavated material was used to fill about half an acre of swamp, at the original outlet of the creek, to an elevation of 3 ft. above high-water level. The sides of the creek channel change were riprapped, and the whole space sown with grass seed and trees planted along the outer edge. The cost of this work was as follows:

Excavation labor (450 cu. yds. earth, 520 loose rock, 1,160 solid rock)	$3,890.00
Depreciation of tools	187.00
Powder, 1,470 lbs.	235.00
Cement, 190 bbls. at $2.50	475.00
Reinforcing steel	120.00
Lumber	235.00
Hauling rock, 165 yds.	180.00
Hauling sand (boat and team), 85 yds.	160.00
Handling and screening rock (labor)	113.00
Labor on concrete, reinforcing, etc.	668.00
	$6,263.00
Backfilling and grading, 7,320 cu. yds. at 36½ cts.	2,670.42
Total	$8,933.42

Gate House.—The gate house at Station 0 was built of concrete to a height of 14 ft. above the grade line of the culvert. It is rectangular in form, the inside dimensions being 7 ft. x 9 ft., and its long axis at right angles to the center line. The walls were 20 ins. thick at the top battering on the outside at 1 in 12. The concrete floor slab was 15 x17 ft. and 12 ins. thick, reinforced with a grid of ½-in. steel, 10 ins. c to c., the foundation being a firm, coarse sand. The outlet to the culvert was of the same cross-section as that structure.

Provision was made for the entry of two 36-in. intake pipes, one of which was constructed with the present installation. Four inches of this pipe protruded through the concrete, and a 36-in. coffin sluice gate was bolted to its flange. The invert was set 6 ins. above the floor level and 9 ft. below the normal level of the loch.

The house was built to a further height of 18 ft. 6 in. above the concrete in uncoursed rubble of red granite, broken from glacially deposited boulders collected from the surrounding hills. The walls were 18 ins. thick, and the general treatment was that of an embattled tower. Two feet below the battlements, a roof of reinforced concrete was placed, draining through 1-in. pipes at the four corners. In the center of the roof a concrete block held a socket for the support of a 20-ft. flagpole.

At the top of the foundation concrete a floor of 2-in. plank is carried on 3-in. x 6-in. joists notched into 40-lb. T-rails. On this floor is bolted the base of the sluice gate wheel stand, and access to the lower floor of the gate house is gained by means of a trapdoor and steel ladder.

Backfilling was carried to the base of the granite superstructure, forming a berm 10 ft. in width, sloping at 1½ to 1, to the general elevation of the graded and cleared space 3 ft. below the berm level.

An oak door, 3 ft. x 6 ft. 8 ins., with ornamental wrought-iron hardware, furnishes entrance from the berm on the east side of the building. Above the door is a vertical ventilating opening, 30x6 ins., protected by copper wire cloth of 4x4 mesh. Built into the center of the south wall is a polished black granite date stone, 5 ft. x 3 ft., with V-cut gilded lettering.

The cost of this work was as follows:

Excavation, 150 cu. yds.	$ 115.90
Substructure, 50 cu. yds., at $12.65	632.55
Teaming and collecting boulders	350.00
Masonry, 38 cu. yds.	547.18
Valves and ladders	280.00
Flooring, rails and joists, etc.	18.32
Door	38.00
Date stone in place	102.00
Flagpole, etc.	37.00
Total	$2,120.95

Intake Pipe.—The specifications on which bids were asked contemplated 500 ft. of 36-in. steel intake pipe, ending in 22 ft. of water. The invert was to be at no point less than 6 ft. below the low-water level of Loch Lomond. Before construction commenced, however, the intake was increased to 750 ft., ending in 42 ft. of water, with the invert at no point less than 9 ft. below the normal level of the loch. The pipe was manufactured by the James McNeil Bros. Co., of Pittsburg, of ¼-in. plate and 36-in. internal diameter.

The material used in the construction of this pipe was of soft open-hearth steel of an ultimate tensile strength between 55,000 and 65,000 lbs. per sq. in., and an elastic limit of not less than half the ultimate strength. Elongation, 22 to 25 per cent, and reduction of area, 50 per cent. Bending test of 180° to a diameter equal to thickness of pieces tested, without fracture on outside of bent portion. Variations in thickness or dimensions of pieces were not to exceed 5 per cent, and variations in cross-sections were not to exceed 6 per cent.

Both longitudinal and circular seams were single riveted with rivets of ⅝-in. diameter, with heads clean and cup-shaped, both inside and outside, and a pitch of 1⅝ ins., c. to c. All rivets were of the best Lowmoor, or equal quality iron, with an ultimate strength between 50,000 and 60,000 lbs. per sq. in.

Flanges on the end of each length were of rolled angles, 3x3x½ ins. in thickness, of the same quality steel as the plates, welded into solid rings. Special care was taken that the butt end of these flange joints made perfect contact, being machine faced and accurately leveled on a block before being drilled or riveted to the pipe. Holes in flanges, both for riveting to plates and for bolting together, were drilled; those for jointing were accurately pitched, 32 in number on a bolt circle of 40½ ins., to take ¾-in. bolts. The back and face of the angle flange were made perfectly parallel to give perfect bearing for the heads and nuts of the bolts. The faces were tested by rolling between two fixed points to insure their being at right angles to the axis of the pipe. The pipe was made in alternate parallel rings, the small rings being of 36 ins. internal diameter, and the end angles or flanges were placed on the smaller rings of plates, each ring being in one plate, with seams on alternate sides of the pipe. The edges of all plates were planed to a suitable bevel for Conway's style of caulking, all seams being caulked both inside and outside.

The ¾-in. bolts had the thread turned off and the ends rounded for about half an inch from the end, each bolt being 4 ins. long from under the head to the point. Nuts and heads were hexagonal, and one wrought-iron flat washer was used with each. A lead joint ring formed the gaskets.

The length of each pipe was 30 ft., made up of 5 plates. Every 60-ft. joining the second and third plates of every alternate pipe was a McNeil flexible and expansion joint, which gave ample flexibility within the required limits of about 2°. The drawing shows clearly the construction, but, briefly, the plate on the part of the pipe with a small pipe ring extended about 9 ins. beyond the heel of a 4x4x13/16 in. welded L. A plate

ring from the abutting pipe, but riveted to the outside of the large pipe ring, around which was first welded a 4x4x13/16 in. L, formed a sleeve over the first projection and partly over the foot of the first L. A gasket of ½-in. lead pipe between the two projecting pipe rings permitted some flexibility of motion and still held the joint tight, being prevented from slipping off on the inside by a 3x3/16-in. band riveted to the end of the small projecting pipe ring. Twelve 1x15-in. bolts joined the flange angles and completed the joint.

When completed, and before coating, each pipe was tested to 25 lbs. to the sq. in., all leaky rivets being cut out and replaced, and all seams showing leakage, were recaulked until a satisfactory test was secured.

After testing, the pipes were thoroughly dried and cleaned, and heated in an oven to a temperature of 300° F., after which they were thoroughly coated by dipping in a bath of mineral rubber asphalt, manufactured by the Assyrian Asphalt Co., of Chicago. The bath being heated by steam to a temperature of 300° F.

On receipt of the pipe at the city dock, all places from which the coating had been knocked or rubbed, were cleaned and temporarily vaselined. They were hauled to the work when winter had set in, on sleighs with bunks specially prepared, in the form of cradles, lined with old rubber fire hose at all points of contact, to prevent abrasion of the pipe coating.

At the outer end of the intake, a quarter bend supported by knee and foot plate, was provided finishing 6 ft. above the invert of the pipe. Attached to the bend was a 3-ft. length of pipe surmounted by a circular strainer, 4 ft. in height and 4 ft. in diameter at the top, the top covering curving to a 6-in. rise at the center. Top and sides were punched with holes 1 in. in diameter, 2 ins. c. to c.

To secure the required depth of 9 ft. for the invert of the pipe, it was necessary to construct a cofferdam to a point 277 ft. from the gate chamber. It was proposed to lower the remaining 473 ft. from the ice in one piece.

Prior to the commencement of the work, the ice was kept comparatively clear of snow to insure rapid thickening, and operations began during the first week in January, 1908, with an ice thickness of 24 ins.

All the pipe was first examined for scratches and holes in the coating, and the steel thus exposed carefully cleaned of all rust by scrubbing with a stiff brush and dilute hydrochloric acid, followed by a mopping with a saturated solution of soda to remove the acid. After all rust had been removed the alkali was washed off and the plate thoroughly dried. In the case of scratches and very small holes, the coating was replaced by pressing over the adjoining coating with a very hot flatiron immediately after the preceding treatment. Where the exposed surface was too large to be covered by this method, it was painted with three coats of mineral rubber field paint manufactured for the purpose by the patentees of the original coating.

A detailed examination of the lake bottom was made by divers, who removed the few snags and logs found on the located line. For about 200 ft. from the shore line a firm sand beach bottom was found, after which the sand was overlaid by about 1 ft. of mud.

The outer eight lengths of pipe (480 ft.), were bolted together in position on the ice and the quarter bend, over which was bolted a tight blind gasket, was attached. To the foot plate, two timbers, 12x12x18 ft. were bolted. At intervals of 60 ft. along the pipe line a pair of 6-in. guide poles were let through the ice and driven into the lake bottom. These poles were 10 ft. apart at the ice level and 4 ft. at the lake bottom. Several ropes of the proper length were carried from the pipe to 12-in. poles let through the ice and frozen in to insure that the shore end of the pipe rested in correct position. During the progress of this work the temperature did not rise above 0° F., and occasionally fell to 40° F.

A trench, 4 ft. 6 ins. wide, along the entire length of the pipe, was then cut through the ice, which was at this time upwards of 3 ft. thick. The pipe was then temporarily supported on timbers extending across the trench. As it was the intention to drop the pipe into the water and to permit it to fill slowly through the shore end, a perforated gasket was fitted at that point. The timber footing under the quarter bend was loaded to make it very slightly heavier than the rest of the pipe line.

Four men were then stationed every 30 ft., two on either side of the pipe, and using long poles as levers held the pipe in place while the temporary cross timbers were cut away. On signal the pipe was gently lowered until it floated and the water gained entry through the perforated gasket. The ropes, previously placed and looped under the pipe, controlled its descent so that the top of the perforated gasket was the last to disappear. Failure on the part of some of the men to obey the starting signal, however, caused a slight unevenness in the lowering operations, and the two bolts on one flexible joint, and one on another, were broken. These were replaced by a diver and the accident apparently had no injurious effect on the pipe. Two hours and twenty-two minutes elapsed from the cutting of the last temporary cross-brace until the pipe rested on the bottom of the lake.

This somewhat crude method of laying the pipe avoided the necessity of hauling special machinery to a location which was difficult of access. The necessary labor was available at the cofferdam and other portions of the work.

It was originally intended to lay the pipe in cradles, but it was decided that the foot or eighteen inches of mud overlying the sand bed would serve as an effective natural cradle.

The inshore portion of the pipe, previously laid, was inclosed by a cofferdam, the blind gasket at the inlet having excluded the water during the process of pipe laying inside the dam.

The cofferdam provided an inside width of 10 ft. Two double rows of 10-in. x 20 ft. round piling were first driven seven feet apart on both sides of the pipe, and 12 ft. c. to c., for 152 ft., until the water reached a depth of 5 ft., after which the longitudinal spacing was 8 ft. c. to c., for a further 80 ft. Up to the aforesaid 5 ft. in depth, a single line of 3-in. sheeting, 14 ft. long, was driven back of a 4x8-in. through waling. The inside piles were tied to the outside piles by ¾-in. x 8 ft. 6 in. bolts, thus avoiding the necessity of inside bracing, and the clay filing was dumped on the outside of the sheeting, the ice preventing all possibility of wave wash. The 3-in. sheeting was 10 ins. wide sloped 45° at the foot, and tongued and grooved by inch squares screwed every 12 ins.

All piling was driven with a small steam driver, provided with a 1,000-lb. hammer and 36-ft. leads.

The portion of the cofferdam in a greater depth of water than 5 ft., was double sheeted in a similar manner, but a 4x8-in. waling was run on both sides of each row of pilings and the sheeting driven on the inside of the waling next the core, which was composed of puddled clay. The round piles were similarly tied together by ¾-in. rods, but it was found necessary to carry struts across the top of the trench at every pile. The coffer-

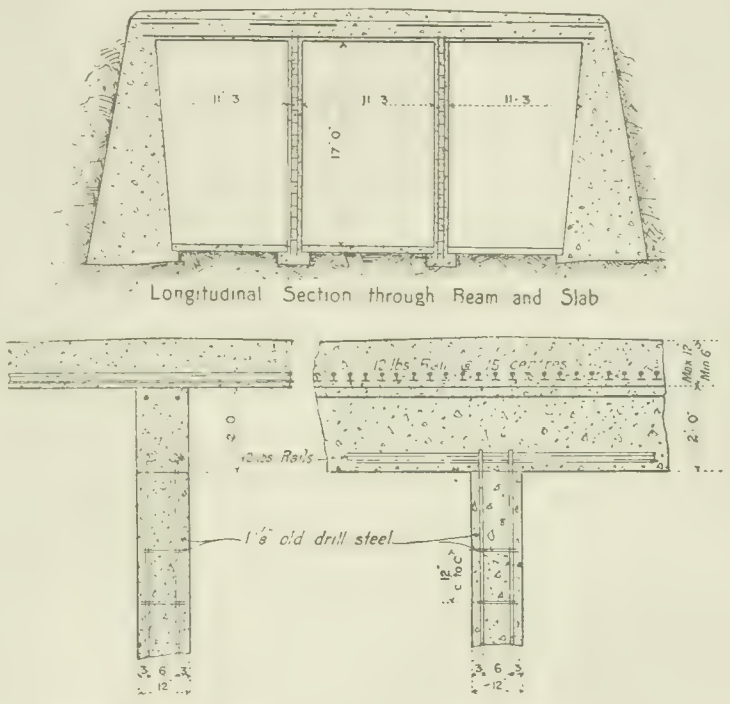

Fig. 6—Details of Reinforced Concrete Roof of Forebay.

dam was made tight at the outer end containing the pipe by forming the sheeting and dumping a considerable quantity of clay at the outer side.

A 500-gal. per minute centrifugal Lawrence pump with 6-in. suction and 5-in. discharge directly coupled to a 5 hp. Westinghouse 550 volt A. C. induction motor, unwatered the cofferdam.

The excavation revealed 1 ft. of beach sand overlaying a stratum of very porous wet sand 18 ins. deep, under which was a fine quicksand. During the progress of excavating and laying, there were no less than five breaks, four of which were caused by the presence of a buried log at the outer end. A combination of baled hay and clay enabled operations to be resumed after delays varying from a few hours to two days.

When the pipe laying had been carried to the gate house and the sluice valve installed, a diver removed the blind gasket from the outer end and placed the 3-ft. length of pipe and strainer. A large quantity of concrete was placed around, under and over the foot plate and timbers at the bend.

Before the spring thaw moved the ice from the lake, back filling had been carried within about 100 ft. of the outer end of the cofferdam. As no danger was anticipated, operations ceased until work could be carried on to better advantage. During the summer, however, it was noticed that there was a hump in the middle portion of the pipe, that had not been backfilled, within the cofferdam. As an inch air pipe had been placed in this portion, it did not seem probable that an ac-

cumulation of air could have raised the pipe to the point of buoyancy, and it was thought that the pressure of the quicksand gradually raised the pipe, especially as the portion backfilled remained true to grade.

During the following winter the cofferdam was again unwatered. The only leakage of any moment was from the joint just inside the end barrier. The pipe was lowered to grade and the joints made tight. To avoid any chance of a recurrence of the trouble, 8x8-in. timbers were bolted across the pipe at every pile bent, and the pipe protected from abrasion by old rubber fire hose placed under each timber. Struts were also run down at an angle of 45° from the top of the piles to the center of the cross-brace. The backfilling was then completed with sand and a layer of rock from the tunnel waste spread over the whole to a depth of one foot.

The cost of this portion of the work was as follows:

750-ft. steel intake pipe with strainer and joints	$ 7,068.20
Unloading and treating pipe	144.90
Hauling pipe	204.40
Cutting ice, connecting and laying pipe	780.00
Lumber in cofferdam	2,278.35
Iron in cofferdam	255.21
Hauling clay for core	240.00
Tools and material	253.50
Hire of pile driver	201.60
Pump, motor and transformers installed	740.00
Labor on cofferdam, cutting piles and tamping clay	1,532.00
Excavation, including breaks and pumping	2,253.60
Lowering raised pipe	1,197.90
Backfilling, 960 cu. yds.	750.95
	$17,900.00

Forebay.—At the north portal of the tunnel 20 ft. of open cut, concreted in the same manner as the south portal culvert, led to the forebay. The natural slope of the hillside at this point was very steep, necessitating benching into the hill to secure a satisfactory site for this structure. A bench was cut approximately 6 ins. below the tunnel grade line for a distance of 60 ft., affording a solid rock foundation for the waste pipe and backfilling, as well as for the forebay walls.

The general plan of the forebay is segmental, with an inside diameter of 36 ft., the rise being 24 ft. The chord is at right angles to the center-line of the tunnel, which bisects it. The concrete walls have a width of 2 ft. at top, and are carried up to a height of 18 ft. above grade with a batter on the inside of 1 in 12, and on the outside of 1 in 6. An 8x6-ft. gate chamber was placed in the circular wall, on a radical line leading to the supply pipe line to the reservoir. The walls are vertical on the inside, 2 ft. wide on top and battering on the outside 1 in 6. Two center pilasters, 1 ft. x 1 ft. 6 ins., were grooved to receive a 5-ft. screen of a 4x4 copper wire cloth mounted on three frames, 6 ft. high, of 1-in. galvanized iron pipe. Each section has a center vertical brace of 1-in. pipe. All joints and bends were made with elbows or tees, and a ⅞-in. bar which projected 8 ins. from the lower corners of the top and middle sections, fitted into the open end of a T at each of the upper corners of the middle and lower sections.

One 36-in. coffin sluice gate, bolted to a thimble set in the concrete wall, admits water from the forebay to the gate chamber, the floor of which is 1 ft. lower than the forebay. Three 18-in. sluice gates, bolted to thimbles, provide outlets to the supply mains leading to the reservoir, one of which is now in use. Three lengths of pipe were attached to each of the other gates, in order to clear the toe of the backfilling slope.

Sixty degrees east, on a similar radial line, three lengths of 36-in. cast-iron waste pipe were installed, operated by a sluice gate rising with a vertical buttress from the inside of the forebay. The outer end of the pipe was set in a 12-in. concrete head wall, with 10-in. coping projecting 3 ins., and a sunk wall carried down 4 ft. to shale rock foundation.

The walls rested on solid rock, in which a trench about 6 ins. deep was excavated to receive them. Within the trench numerous holes were drilled about 6 ins. into the rock to receive dowels of 1⅛-in. scrap drill steel from 12 to 24 ins. in length. Three inches from the inside face, expanded metal reinforcing was placed to take up temperature and contraction stresses.

The concrete floor varied in thickness from 6 to 15 ins., and was laid to drain to the waste pipe, the invert of which was 9 ins. below the tunnel grade. A large number of rock "fillers" were used up to within 6 ins. of floor level.

It was originally intended merely to fence in the forebay, but it was subsequently decided to construct a reinforced concrete cover containing a manhole, etc.

This cover was supported on two columns 12 ins. square, each reinforced with four bars of 1⅛-in. old drill steel on a footing 24 ins. square, carried from a solid rock foundation. The columns divided a line drawn parallel to the segmental chord, and 12 ft. distant therefrom, into three equal bents. A beam, 12x20 ins., was carried across the columns in the same parallel line, and was reinforced with two lines of old 12-lb. steel rails, placed 2 ins. from the bottom. Two 7-ft. lengths were also placed at the top of the beam above each column to provide against shear.

The cover extended to the outer edge of the walls, and had a minimum thickness of 6 ins., including the granolithic finish. It was reinforced at 10-in. centers with old 12-lb. steel rails, carried from walls to beam and finished with a 1-in. layer of granolithic, compounded of 1 part cement, 1 part sand, and 3 parts granite chippings. The surface was trowelled smooth and even, marked and rolled, with a grade of 6 ins. from the center to the walls. In the center of the cover was placed a 5x3 ft. red granite date stone.

The concrete used throughout was a 1:2:5 mixture, handmixed to the same specification as adopted for the south end culvert. The sand was practically all Isle Royale sand, hauled from the river bank 6 miles distant. A 3x2 ft. manhole was provided ot the southeast corner, with steel ladder and ventilating cover.

The gate chamber was covered with a 2-in. plank floor, protected by 26-gage galvanized iron, resting on and bolted to 40-lb. T-rails. Trapdoors, 2x2 ft., were provided, one on each side of the screen with an additional narrow trap, 1x6 ft., to permit the screen to be hoisted. Two steel ladders were provided, and fixed to afford means of descent for purposes of examination.

The walls were constructed during the summer of 1908, when a 7x7 ft. opening was left in the outer wall to furnish exit for the dump cars from the tunnel. This opening was filled in during June of the present year, 24 crossbars of ½-in. steel being placed as reinforcing, and holes drilled in the concrete to receive their ends. The face of the old concrete was "roughed," thoroughly washed, and painted with a neat cement grout immediately prior to running the new concrete. This process secured a perfectly tight joint.

When filling this opening a ¾-in. galvanized iron pipe was carried through the forming from the forebay to a hole drilled in a granite boulder set on the head wall over the waste pipe. A ½-in. copper goose neck discharges a constant stream from the boulder.

To secure backfilling, a borrow pit was opened in the adioining hillside, and the whole forebay backfilled to the base of the cover, forming a minimum berm of 8 ft., from which the embankment slopes at 1½ to 1, the toe being retained by a dry wall 3 ft. in height. The cars and rails from the tunnel were used for the conveyance of backfilling. Care was taken to have the surface of the berm and slopes covered with at least 3 ins. of good loam, which was afterwards sown with grass seed. The cost of this portion of the work was as follows:

Forebay and Flume:	
Excavating 1,400 cu. yds. solid rock	$ 1,570.00
Powder, 2,050 lbs.	302.50
Steel, tools, fuse, etc.	85.00
Total	$ 1,981.00
Labor on concrete, 472 yds. (including forming)	$ 2,512.00
Sand, 160 yds., at $1.25	200.00
Hauling sand, 160 yds., at $2.50	400.00
500 bbls. cement on the work, $2.50	1,250.00
Teaming and screening rock, 480 yds.	818.00
Lumber for forming 29,600 f.b.m., at $25.00	740.00
36-ft. 36-in cast-iron waste pipe in place	271.00
Sluice gates	710.00
Reinforcing	56.50
Total	$ 6,957.50
Cover and Piers (22 cu. yds.)	
Labor, mixing, forming (old lumber), and placing	$ 148.35
Old steel, 4 tons, at $25.00	100.00
Cement, 25 bbls., at $2.50	62.50
Sand, 10 cu.-yds., at $3.75	37.50
Rock, 25 cu.-yds., at .60	15.00
Tool depreciation	18.75
Date stone	77.00
Total	$ 459.10
Backfilling, 1,850 cu. yds.	782.35
Grand total	$10,182.95

Modern Requirements of a Public Water Supply.—The opinion of sanitary engineers, sanitarians, and in general those who are familiar with the proper development of water supply interests, has now become fairly well crystallized with respect to the requirements which a water supply should fulfill. These requirements are sanitary, aesthetic, commercial and protective in their nature. The writer has summarized them as follows:

(a) Requirement of Quality.

(1) Primarily the water supply must be free from pathogenic or disease-producing organisms. More than this, it should be free from those allied organic forms which may not as yet be recognized as accompanying disease, but which may, nevertheless, not be conducive to health. This condition of safety must prevail continuously and the supply must not be subject to what may be termed "accidental" contamination.

(2) The water must be uniformly clear and free from turbidity, both that which may be produced by suspended mineral matters, and also that which may be due to suspended organic (vegetable and animal) growths or impurities.

(3) The water must not be discolored by dissolved vegetable matters to such an extent that it may be objectionably apparent when employed for table use or in the arts.

(4) The water must at all times be free from both tastes and odors, either those produced by dissolved gases or those which may be due to the growth and decay of micro-organisms (minute plants and animals frequenting lakes, reservoirs and rivers, but usually prevailing to the least extent in the last named source).

(5) As far as possible the water should be cool and palatable.

(b) Requirement of Quanitity.

(6) The supply must be abundant and unfailing, but for economic reasons must be conserved in such manner that all preventable waste shall be eliminated.

(c) Requirement of Physical Safety and Dependableness.

(7) The pressure under which the water shall continuously act in the distribution pipes must be ample to serve the various districts according to their specific character and needs.

(8) The system of works must be one in which design and construction may be executed in such a way that they will successfully meet conditions imposed by the natural phenomena occurring or likely to occur within the region in question.

(9) The various structures in connection with these water works should be so located, arranged, built and protected that they may not be unduly exposed to fires or other accidents befalling neighboring structures.—Charles Gillman Hyde in the *California Journal of Technography*

At the last meeting of the City Council of Phoenix, Ariz., it was decided to grant right of way through the city for the proposed Buckeye railroad, a Southern Pacific feeder

Advices from Ely, Nev., state that the Waasatch Construction Co. has been awarded the contract for the construction of the washed out portion of the Eureka & Palisade Ry.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Standardization of Tar for Paving Purposes.*

Interesting though it be, and indeed necessary for those who would go into the question of tar-bound road construction in a thorough manner, it is not possible in this instance to go fully into the question of tar production and the causes that lead to great variability, but it is accepted that there is great variation in the quality of tar. The matrix is the crux of the whole question of bituminous-bound macadam roads, and brings one to the very important question of standardization of tar for paving purposes.

DESCRIPTION OF TESTS APPLIED.

Comparatively recently the author had the opportunity elsewhere of describing certain means that he had taken to ensure a uniform and standard tar for paving purposes. Among other qualities which needed, in his opinion, to be considered were the following—viz., volatility, viscosity, power of adhesion to aggregate, specific gravity, free carbon and restriction and regulation of amount of distillate at various temperatures.

Tars of various descriptions and from various sources were taken in their crude state, were distilled to a comparatively uniform specific gravity and the residual soft pitches or tars of uniform specific gravity were subjected to various tests. For instance:

For Volatilization.—This appears to be an important one, for to a diminishing degree the constitutents will be volatilizing from the day that the tar-macadam is first laid, and such volatilization cannot go on to a very great extent without impoverishing the surface and tending to disintegration.

For this test the various samples were taken and placed, in layers of ⅜-in. in thickness and not more, into open dishes and exposed to a temperature of 60° F., for one week, and then the percentage of loss by volatilization was ascertained. The residue from this test was then exposed to a temperature of 110° F., for one week, and the loss by volatilization at this temperature was recorded.

For Viscosity.—The necessity for a high viscosity must be readily apparent, although, of course, of itself its determination in tar-macadam would be valueless, for it would show that hard pitch, with its undesirable brittleness, would be the most advantageous fraction of tar to be utilized. However, in order to ascertain the comparative viscosity, samples of the aforementioned soft pitches were taken. The method of testing was as follows: The various descriptions of tar were put into small tins, about 2¼ ins. in diameter by 1½ ins. deep, and these were placed in water contained in a tin tray about 14 ins. by 14 ins. by 2 ins. deep, the water being heated by means of a Bunsen burner, and to prevent it becoming unevenly heated the burner was kept continually moving over the entire area of the tray bottom and the water continually stirred. Water lost by evaporation was constantly replenished, so that the same level was retained in the tray. Observations were taken when the temperature of the water was recorded at 62° (atmospheric temperature), 78°, 90°, 110° and 120° F. At each of the before mentioned temperatures, circular copper discs, 1 in. in diameter and 5.715 grammes in weight, were laid flat upon the surface of the tar and the time required for the complete covering of the disc by the tar was recorded.

Determination of Free Carbon.—It must be obvious that a large percentage of free carbon is to be avoided, but a certain amount must necessarily be admissible. The samples previosuly referred to were subjected to the following test to ascertain the percentage of free carbon in the soft pitch—viz., ten grammes of the sample were successively extracted with hot benzine, alcohol and carbon bisulphide until the extractive liquid was no longer discolored. The residue was dried at 100° C. and weighed.

Adhesion.—For this important test the author devised a machine for ascertaining the tensional strain required to sever briquettes that had been previously joined by the various samples of tar of which the adhesive properties were required to be known. The principal parts of this apparatus are: A spring balance with a large metal dial graduated in single ounces up to 50 lbs. (which would have been better increased to 100 lbs.) and fitted with a maximum hand: the jaws which hold the briquettes, one in each pair; the screw employed to pull them apart. The double briquette, joined with the tar compound, is placed in the two pairs of jaws, which are made from stout brass castings and suitably shaped to receive it, and rests on rollers attached to the base which are provided to reduce the friction. When the briquettes are in position the wheel attached to the screw is turned so as to pull on them and thus on the spring balance, and this is continued until the briquettes break apart at the junction—the maximum force used being registered by the second pointer of the balance. First—there were made some hundreds of briquettes in a special mould, similar to an ordinary mould for making cement briquettes, save that it made half briquettes only, and made such briquettes with a cross sectional area of 4 sq. ins. These briquettes were made with cement and plaster of Paris, and great care was taken to get a perfectly uniform face. They were then dried for a considerable time. Then were taken various samples of soft pitch to be tested, and these were raised to a predetermined temperature, 250° F. A number of these half briquettes were then dipped into this heated tar, the surfaces being rubbed together for the expulsion, so far as possible, of any imprisoned air, and then firmly pressed together by hand pressure and stood in a vertical position to cool. For the testing of each particular sample there were taken four complete briquettes (8 halves) at a temperature of about 60° F., and the same number heated (before being dipped in the tar) to a temperature of 100° F. After they had cooled in a room of even temperature of approximately 55° F., the tar-jointed briquettes were broken as one would break ordinary cement briquettes, either upon the ordinary double lever cement testing machine (for strains over 50 lb.) or upon the special machine previously described. Where the tensional strength was considerable, the cement-testing machine answered the purpose quite well, but where the adhesion was small (under 50 lb.) it needed to be recorded upon the more delicate instrument that was specially made. After the briquettes were broken and results recorded, the briquettes were carefully and evenly pressed together again by hand pressure (the tar being cold) and left for 24 hours and again tested. The complete results of these tests were tabulated and considered.

From the result of numerous distillations of crude tar and of the resultant soft pitches, and with the subsequent tests for volatilization, viscosity, etc., an attempt was made to lay down certain standards.

The question of standardization depends greatly upon local requirements, but, generally speaking, it appeared to the author that there are required to meet the varying climatic conditions and to meet methods and materials of construction for tar concrete, at least two standards of matrix, which may be described as "moderate" and "heavy." The times and opportunities for the use of each particular grade must be more or less a matter to be decided locally.

SUGGESTED STANDARDS FOR MATRIX FOR TAR CONCRETE.

It is suggested that the "heavy" grade tar should comply with the following specification:

The tar or soft pitch shall be produced by the distillation of tar derived exclusively from bituminous coal, and must contain no impurities. The specific gravity, as determined by a tar specific gravity bottle, should be approximately 1.220 at 15.5° C. On distillation (the bulb of the thermometer being placed in the vapor at a point where it enters the side tube of the distillation flask) it must not yield more than 10 per cent of distillate below 289° C., and not more than 25 per cent below 350° C. The free carbon determined as specified in the tests described must not exceed 16 per cent by weight. When thoroughly mixed with water and kept for some time at a temperature of 110° F., the water shall contain not more than 23 grains per gallon of total solids. On exposure to an atmosphere of approximately 60° F., for one week, in a layer not exceeding ⅜ in. in thickness, the tar must not lose more than 1.5 per cent of its weight, and the residue from this test must not lose more than 3.5 per cent of its weight on exposure to a temperature of 110° F., for one week. Its viscosity shall be such that when tested in the manner described the disc shall not be covered in a less time at 60° F. than 5½ mins., nor in less than 10 seconds at 110° F. There shall be recorded an adhesive strength upon the 4 sq. ins. ends of the briquette, from experiment conducted in manner described, a result of at least 75 lbs. with the cool briquette, and the re-adhesion shall comply with the like test.

Now, for the "moderate," tar there must be the following amendments from the figures specified for the "heavy" grade—viz., the specific gravity to be reduced from 1.22 to 1:195; there must be not more distillate below 350° C. than 35 per cent as against 25 per cent; the volatilization tests to be 2 per cent for the first week and 8 per cent for the second week, as against 1.5 per cent and 3.5 per cent for the "heavy" grade. The viscosities to be 30 seconds and 2 seconds at the two temperatures of 60° and 110° F. The adhesive strength to be reduced in each case from 75 lbs. to 45 lbs., but otherwise the specification is to remain the same.

LIVERPOOL STANDARD FOR MATRIX FOR PITCH-MACADAM.

Now for "pitch-macadam," a much heavier matrix is desirable and permissible, and in this connection the author begs to quote from "Dustless Roads," where the matrix for "pitch-macadam" is fully dealt with as follows:

The specification for the matrix as prepared by Mr. John A. Brodie, City Engineer, Liverpool, who was, so far as the author knows, the first to seriously and scientifically standardize the matrix, is as follows:

Pitch.—(1) The pitch must yield no matter volatile below 270° C., when subjected to dry distillation, and its total volatile organic matter must not fall below 30 per cent.

(2) It must not contain more than 80 per cent of its weight of matter insoluble in petroleum spirit of 0.700 specific gravity (boiling), and must be free from extraneous matter such as sand and grit.

(3) It must twist fairly after immersion for two minutes in water at 60° F., but not under 55° F.

Creosote Oil.—(1) The creosote oil shall be obtained exclusively by the distillation of coal tar and not more than 6 per cent shall redistil below 240° C.

(2) The oil as obtained by the distillation of coal tar shall not be treated in any way, either by the addition of any coal tar product or by the extraction of any of its constituents, excepting such extraction as may be

*From an article by J. Walker Smith, City Engineer of Edinburgh, in The Surveyor.

necessary to comply with the following requirements.

(3) It shall contain no solid matter at 15° C., and shall have a specific gravity of not less than 1.060 (taking water as 1.000 at 15° C.).

(4) It must contain not less than 25 per cent of its constituents that do not distil over below 320° C., and the 75 per cent which does distil over below 320° C., shall contain 10 per cent of tar acids to be extracted by soda, specific gravity 1.125 (water 1.000).

The hot pitch and oil shall be tempered in a pitch boiler until it complies with the following practical tests: The mixture, when cooled in water, at 60° F., should stretch at least 3 ft. before breaking, and the threads so formed should pull out very finely indeed. It should also, when doubled into a length of about 1 ft., bear hitting hard on an iron or stone surface without showing sign of cracking.

It may not be out of place if the author at this point briefly indicates the reasons for those specified requirements.

Mr. Brodie had found that the tar distillers and merchants were not supplying him with a thoroughly good paving pitch, and what was worse, it was not uniformly mediocre, but was variable in a very high degree, so that he, very wisely as the author thinks, worked from an excellent pitch which he had procured from some paving taken up after 20 years' wear, which pitch was found to be practically as fresh, tenacious and full of life as when first laid, and he consequently worked back from this time-proven sample and practically determined his standard from analysis of it. Now perhaps a brief explanation of the meaning of and reasons for this specification as they appear to the author may be permitted.

REASONS FOR SPECIFIED REQUIREMENTS.

Pitch.—(1) "The pitch must yield no matter volatile below 270° C., when subjected to dry distillation."

The compliance with this clause would result in no light oils being present, and would practically ensure that distillation had been carried to that point at which most of the naphthalene had been removed. It would, in fact, have ensured the elimination of much that it is inadvisable to retain in the form of light oils, and the removal of a considerable amount of naphthalene, which has a high vapor tension and general physical characteristics which are undesirable for good paving work. If there were no such provisions the result of the distillation might be, as it frequently used to be, that the tar had been distilled down to hard pitch and revivified with such light oils as were not required. This would result in a pitch that had not the same elastic and agglomerating qualities that a good soft pitch should have. The hard pitch, of course, would not be revivified with the lightest oils because these are commercially of the most value. For instance, 90 per cent benzol has about five times the value of pitch, so that the distiller would not be likely to revivify with this fraction, but he would revivify with considerable percentages of creosote and naphthalene. Then as to the specified requirements that "the total volatile organic matter must not fall below 30 per cent." It would, perhaps, be better if there were some definite temperature fixed, such as 350° C.

The idea appears to be that of obtaining a pitch that is bereft to a reasonable extent of its light oils and naphthalene without any encroachment being made upon the heavy creosote and anthracene oils.

(2) It is self-evident that freedom from extraneous matter, such as sand and grit, is desirable; the point in this which requires some comment is the desire for a certain percentage of matter soluble in petroleum spirit of a given specific gravity. The author does not think, as the clause stands, that it is of very great value, inasmuch as almost any tar would satisfy this clause if treated with an unlimited quantity of solvent (boiling). But apparently the idea has been to retain as great a proportion of creosote and tar acids as possible, as these substances are highly soluble in petroleum spirit. It does not, however, appear to the author to be a very important clause.

(3) This is a practical physical test aimed at providing a certain amount of ductility or elasticity, combined with high viscosity at normal temperatures.

Creosote Oil.—Generally the whole of these clauses are very stringent, and one fears may not be practical with all tars suitable for paving purposes.

(1) This proviso is clearly intended to prevent a large addition of the useless portions of light oils, probably the residuals from the second distillation of the lighter oils.

(2) This aims at the retention of the anthracene and all the oils normally present as the result of distillation of tar, and provides against the elimination of any of them.

(3 and 4) There would appear to be some difficulty in full compliance with clause 3, if one has to read it with No. 4, which requires the retention of 10 per cent tar acids, with which it would be a specific gravity of 1.06 and at the same time have no solid matter at 15° C.

Personally the author does not appreciate the retention of the 10 per cent tar acids mentioned in clause 4, which are the homologues of carbolic acids—viz., cresols and xylenols—and have the same antiseptic properties. Of course, they would be useful for timber preservation, but their special utility for tarmacadam is for the moment not quite apparent.

SUGGESTED STANDARD TAR AS MATRIX FOR PITCH MACADAM.

Alternative Specification.—It may be mentioned that in his excellent pioneer work of standardization Mr. Brodie had much difficulty in getting tar distillers to try to supply a standard article, and it redounds greatly to his credit that in the face of trade opposition he has succeeded in obtaining supplies which invariably, in all essential details, comply with his standard specification, and while that is most satisfactory, it is in the author's opinion found simpler, and the same purpose is achieved with less trouble, and at least equal certainty, by the use of standard distilled tar, which should comply with the following specification:

The pitch shall be produced by the distillation of tar derived exclusively from bituminous coal and must contain no impurities.

The specific gravity, as determined by a tar specific gravity bottle, should be approximately 1.278 at 15.5° C. On distillation (the bulb of the thermometer being placed in the vapor at a point where it enters the side tube of the distillation flask) it must not yield more than 3 per cent of distillate below 280° C., and not more than 18 per cent below 350° C. The free carbon determined as specified in tests previously described must not exceed 16 per cent by weight.

When thoroughly mixed with water and kept for some time at a temperature of 110° F., the water should contain not more than 23 grains per gallon of total solids. On exposure to the atmosphere of approximately 60° F. for one week in a layer not exceeding ⅜ in. in thickness, the pitch must not lose more than 1 per cent of its weight, and the residue from this test must not lose more than 2 per cent of its weight on exposure to a temperature of 110° F. for one week

Its viscosity shall be such that when tested in the manner previously described the disc shall not be immersed to a greater depth than 3-16 in. in a less time, at 110° F., than five mins. There shall be recorded an adhesive strength upon the 4 sq. ins. ends of the briquette from experiment conducted in the manner previously described, at least 230 lbs. with the cool briquette. After heating up to 250° F., and cooling in water at 60° F., the pitch should stretch at least 3 ft. before breaking, and the threads so formed should pull out very finely indeed. It should when doubled into a length of about 1 ft bear hitting hard on an iron or stone surface without showing signs of cracking.

TAR SPECIFICATION AS SUGGESTED BY THE BUREAU OF RESEARCH OF THE NEW YORK STATE.

Certain questions may, and probably will, arise in working to, extending or improving tar standards.

The very full, complete and scientific manner in which the State Departments of America standardize their bituminous material for asphalt work should be an object lesson to British road engineers, and at least the State of New York have now adopted a standard for tar to be used in connection with their bituminous bound roads. Their standard reads as follows:

(1) The tar shall contain no water and not more than 0.5 per cent of mineral matter or dirt.

(2) It shall be uniform in character, appearance and viscosity.

(3) It shall not contain over 1.5 per cent of water soluble materials.

(4) It shall have a specific gravity between 1.20 and 1.29 at 25° C.

(5) It shall contain no body that distils at a lower temperature than 225° C.; not over 9 per cent by weight shall distil below 270° C., and it shall contain at least 60 per cent by weight of pitch remaining after all bodies up to 360° C. have been distilled.

(6) On extraction with benzol it shall contain from 12 to 21 per cent free carbon.

(7) A ½-in. roll of the crude material, 6 ins. in length, cooled to a temperature of 15° C., shall permit a torsional test of at least three complete turns without breaking or cracking, and shall stretch at least 3 ft., forming at the center a very fine thread before rupture occurs.

This had been submitted to the author by the State of New York, and certain queries have been submitted to him by them and by the American Tar Co., there being a difference of opinion between these two bodies as to the practicability of the standard proposed to be adopted.

In consideration of the questions submitted the author collaborated with Mr. Joseph Race, F. I. C., of Burnley.

A few comments upon this American specification may not be out of place.

Nos. 1 and 2.—These seem to be in order.

No. 3.—The allowance of 1.5 per cent of water soluble materials appears to be somewhat generous to the tar distiller, and the figure might with advantage be made rather more stringent by reducing it to about 0.5 per cent. There ought to be some statement as to the manner in which this test should be applied, especially as to the amount of water to be used for a given volume of tar, and also the temperature at which the test is to be made.

No. 4.—This clause appears to the author to be somewhat loose. The limit allowed is much too great. There is such a considerable physical difference between tar with a specific gravity of 1.29 and one with a specific gravity of 1.20 and it is thought to be better that there should be three grades or standards between 1.2 and 1.29, each having over and above the distillation requirements certain physical requirements to comply with, each arranged to be suitable to a particular class of work.

No. 5.—This seems to be generally upon all fours with the standard which the author suggests.

No. 6.—This clause seems to be open to considerable discussion, and it is thought that additional research will be required. The author preferred to leave the clause restricting the amount of free carbon, and the restricted amount was suggested at 16 per cent by weight.

The question now arising is as to the benefit that will be derived from at least 12 per cent of free carbon. Is it beneficial in itself or is it included in order to provide against some contingency or possible dilution? It does not seem probable that free carbon is desirable in itself, as in compression or torsion it would disintegrate to a powder and render the matrix less homogeneous. Tests

for free carbon with tar from various sources resulted as follows:

Description of Tar.	Specific gravity.	Percentage of free carbon.
Tarmite	1.180	10.8
Blast furnace	1.195	16.9
Distilled (North Lancashire)	1.195	11.7
Coke oven (Wigan)	1.210	14.1
Carburetted water gas	1.210	0.36
Carburetted water gas	1.226	0.23
Coal gas (Burnley)	1.215	12.4
Coal gas (Burnley)	1.231	13.6
Tarvia	1.245	11.6

From this it may appear that the reason for the American desire for the 12 per cent of free carbon is to exclude all water gas tar, but whether or not the soft pitches resulting from carburetted water gas tar should necessarily be excluded is open to very grave doubt.

No. 7.—This simple physical test is one that does not need comment.

One of the points upon which the Bureau of Research of the State of New York were in doubt and in conflict with the tar distillers was as to the method of making the distillation test. The State Bureau of Research method was as follows: The distillation test of coal tar is made by weighing 700 grains of the tar into an Eimer & Amend iron retort 4521, with a capacity of 4 pints, the retort being fitted with a tee-outlet and 36-in. delivery tube. The thermometer is so placed that the upper end of the mercury bulb is opposite the outlet of the retort. The thermometer used to have a nitrogen chamber to insure accurate readings at high temperatures. It is necessary to use paper gasket between cover and retort and three Bunsens for heating. At the breaking points viz., 225° C., 270° C., and 360° C.—the flame is removed and the temperature allowed to drop about 20°; the flame is then replaced and the temperature brought to the "breaking point." This is repeated until all is over that will come at that temperature. The temperature is then carried to the next "breaking point," and the method of breaking repeated. The distillates for the different breaking points are caught, weighed and per cent of distillate of tar taken for analyses, figured for the various temperatures."

For this method they appear to find authority, but the companies who manufacture the tar which they wish to purchase claim that their distillation test is too severe, and that they cannot at a reasonable price commercially manufacture tar which will meet the requirements.

The tar distillers require that the distillation should be run through continuously with either no pause or with a slight pause at the breaking point.

It appeared to the author that a little confusion had arisen with reference to the "breaking point." There is no "breaking point" in the distillation of refined tar such as is under consideration. The "breaking point" is only obtained with a crude tar containing ammoniacal liquor, for it is when the water is finally got rid of that the drop of temperature occurs. The heating is continuous, and this break is a natural one, and is explained by the mixture of the two liquids having a lower vapor tension than the sum of the vapor tensions of the constituent liquids.

The following is a description of the method of distilling refined tar as adopted by Mr. Joseph Race in the distillations which he carried out for the author for the purpose of establishing a standard.

Capacity of flask to side tube = 675 c.ccms.

The thermometer should be nitrogen filled, and the flask and air condenser made from the best Bohemian glass. Jena glass is not necessary, better results being obtained with good Bohemian.

Test.—300 c.ccms. (at 15.5° C.) are placed in the flask, which should be protected from draughts and the distillation commenced. The rate of the distillation is regulated so as to obtain as far as is practicable a uniform rate of discharge of the distillate. The process should be a continuous one, the temperature not being held at any particular point or allowed to drop.

The distillates are cooled and measured, all percentages being by volume

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Equipment and Cost of a Fire Service Water Supply System at Winnipeg, Man.*

In the year 1905, the city of Winnipeg was subject to very excessive fire insurance charges, due largely to the fact that the development of the water works system had not kept pace with the extraordinary growth of the city. As a means of relief, and to place the city in the highest class of fire risks, the city council, backed by the board of trade, had a thorough investigation made of fire fighting water works.

Committees of the council with the city engineer made several visits to the principal cities in the United States and Canada, where special systems were in use, and after a careful consideration, determined that the gas engine pumping plant offered, for the conditions of Winnipeg, the most economical and satisfactory solution of the problem of fire protection.

It was essential, from the fire underwriter's point of view, that any plant adopted should be provided with two independent sources of power. Electricity would have been an ideal power, if the above condition could have been fulfilled. Steam was, on account of the heavy standby losses, out of the question. It may be explained that the pumping station of the domestic water works system is about two miles from the business center of the city, and from the bank of the Red River, from which the water for fire protection was to be obtained. Had it been possible to use the steam plant of the domestic system with adidtional boiler capacity, it is probable that steam would have been adopted as the motive power.

Steam and electricity being out of the question, gas power, filling all the requirements, was finally adopted. For alternative sources of power, there are available, producer gas and city gas, in addition to a large reserve of producer gas in the holder.

Standby losses in fuel in this system are practically nothing.

The first of the pumping units was placed in service in November, 1907, and has been available for fire protection since that time. The remaining units were completed, and placed in service between that time and July, 1908, when the whole plant was practically completed, and its operation taken over by the city.

The distribution is made by eight miles of mains from 10 to 20 ins. in diameter, and 85 fire hydrants. It covers the central, closely built, business section of the city.

Pumping Station.—The pumping station is situated on the bank of the Red River and contains the following equipment: 4 Crossley, 2 cylinder tandem gas engines of 540 h.p. each; 2 Crossley, 2 cylinder tandem gas engines of 250 h.p. each; air compressing starting plant in duplicate: 1 producer gas main supplying all engines; 1 city gas main, in reserve, supplying all engines. The engines above described drive six triplex double acting pumps. The pumps are furnished with suction and discharge mains, twenty inches in diameter, in duplicate, all pumps being connected with both mains, either main being of sufficient capacity for the whole plant. The pumps take their water from a well, which is divided into two compartments, either of which will supply the whole plant. The water is conducted to the well by an intake pipe three feet in diameter, which extends for a distance of four hundred and twenty-five feet from the well to the deep water in the river, where in ends in a stone ballasted crib.

Producer Gas System.—The gas producer plant consists of four Crossley type producers; two of 500 h.p. each 8 ft. 6 ins., in diameter, by 18 ft. in height, and two of 1,000 h.p. each 11 ft. in diameter by 18 ft. in height, with necessary platforms, hoppers and piping. This plant has an overload capacity of 50 per cent with selected coal, and readily makes gas from anthracite, lignite or any noncaking bituminous coal. The coal for use in the plant is delivered on track adjoining the building, and unloaded into a hopper having a capacity of one hundred tons. An elevator fitted with a rotary feeding gear to ensure regular feed without choking, raises the coal to a horizontal conveyor placed above the producer hoppers. The elevator and conveyor are operated by an eight h.p. steam engine.

Two air superheaters 18 ft., 10 ins. by 5 ft., 3 ins., and two 18 ft., 10 ins. by 4 ft., 3 ins., with gas and air connections and dust collectors, are attached to the producers. Each unit is supplied with a hot gas tubular boiler. Four wet scrubbers, each 30 ft. high by 5 ft. in diameter, fitted with tar sieves and filled with coke, remove the condensable hydro carbons from the gas. Three centrifugal tar extractors 5 ft. in diameter complete the removal of the tar from the gas. Two sawdust scrubbers, 9 ft. by 22 ft., either of which is capable of removing any remaining impurities from the gas, are placed near the inlet to the gas holder. In addition to the above, centrifugal circulating pumps and Root air blowers are provided.

The cleaning plant is operated by two 18 h.p. Crossley type gas engines, either of which is of sufficient capacity to drive the whole plant. The plant is provided with all piping, valves, shafting, pulleys and belting necessary for its operation.

An important feature of the installation is that there is a spare unit of each type of machine, so that in case of a breakdown, the plant can still be operated to its rated capacity.

Two steam boilers, of about 50 h.p. each, furnish what additional steam is required for the producer, and also drive the elevator and blowing engines, and supply steam for heating the buildings.

The gas holder and pumping station are connected with the city gas mains by a special 12-in. pipe. If, for any reason, the producer gas system should be out of service, a full supply of city gas may be at once conducted to the holder, or directly to the engines, by a special main provided in the pumping station for that purpose. A gas holder of 250,000 cu. ft. capacity stores a reserve of gas, either producer or city gas, sufficient to operate the whole plant for from one and one-half to five hours. This will give ample time to fire additional producers, or to make provision for the use of the city gas, in case of a long continued fire. It is not likely that more than half the capacity of the plant will be required except in extraordinary cases.

The Distribution System.—Two 20-in. mains lead from the pumping station to Main street by different routes, connecting with submains on the way. Either of these mains, in case of accident to the other, is sufficient to take the water from the pumps when working at their rated capacity. The mains are designed to withstand the ordinary working pressure of 300 lbs. per sq. in., and water hammer. They were tested to 700 lbs.

*Extracts from a paper by N. H. Ruttan, City Engineer, Winnipeg, Man., presented to the American Water Works Association, April 26-30, 1910.

per sq. in. at the foundry, and after being laid were tested to from 500 to 700 lbs. The pipes were provided with extra heavy hubs and two lead grooves. These joints have given entire satisfaction.

The hydrants are connected to the mains by 8-in. flanged pipes. They are provided with 4½-in. hose nozzles with independent gates. These nozzles are, when required, reduced to 3½ and 2½ ins. by suitable reducers, 3½ ins. being the largest hose now used. The hydrant valve is 8 ins. in diameter, and is provided with 1-in. pilot valve to fill the hydrant before opening the main valve against the pressure. Both the valves are operated by the same stem. Each hydrant connection is provided with a gate valve so that the hydrant may be cut out from the system in case of necessity.

The buildings, intake, foundations, and distribution system, were constructed by the city, by day labor, and the cost of the several branches of the work were as follows:

Land			$ 58,549.80
Buildings: Comprising about 840,000 bricks, 7,500 cubic yards concrete, 15,000 cu. yds. excavation, 132 tons structural steel, roofing, millwork, cranes, heating, etc.			179,144.11
Intake from river and well: Excavation, 3,500 cu. yds.; concrete, 600 cu. yds.; Wooden conduit, 425 ft.			28,912.80
Machinery, including gas producer plant			396,003.47
Distribution System:			
8-in. pipe, 285 ft.	$ 3.00	$ 855.00	
10-in. pipe, 18,261 ft.	3.47	63,366.71	
12-in. pipe, 16,290 ft.	4.50	73,307.25	
20-in. pipe, 3,196 ft.	9.20	29,403.20	
8-in. flgd., 1,390 ft.	8.70	12,093.00	
Asphalt, 13,414 ft.	1.30	17,438.46	
8-in. valves, 79	33.00	2,607.00	
Hydrants, 79	200.00	15,800.00	
10-in. valves, 41	45.00	1,845.00	
12-in. valves, 26	68.00	1,768.00	
20-in. valves, 4	180.00	720.00

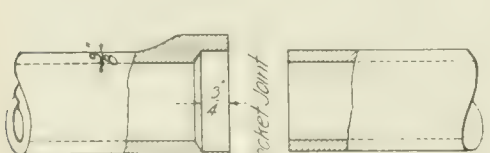
A Molded Fiber Conduit with Bell and Spigot Joints.

The accompanying cut shows the construction of a new form of fiber conduit that possesses several noteworthy features. This conduit is made of indurated fiber, a material which has been used very extensively for insulating purposes, such as third-rail coverings, controller linings, battery boxes, etc. In



Section of Fiber Conduit With Ball and Socket Joint.

making conduit, the fiber is molded into shape under high temperature and pressure, and is entirely without grain or laminations. This process gives each length of conduit a solid ⅜-in. one-piece wall.

The most interesting feature of this new conduit lies in the bell joints shown above. One end of each section is molded to an enlarged size—belled out—with an opening as large as the outside diameter of the opposite end of the next section. Thus, any two sections fit together without any reduction in the wall thickness of either section at the joint. Tests made of this conduit with ⅜-in. thickness of wall show that it has an average puncture voltage of 40,800 dry and 33,000 volts after 40 hours immersion in water. This conduit is made by the H. W. Johns-Manville Co., New York city.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Valuation of the Puget Sound Electric Railway.

BY HENRY L. GRAY, ASSOC. M. AM. SOC. C. E.*

The Puget Sound Electric owns and operates a line between the cities of Seattle and Tacoma, and in addition, branch lines extending to Renton, a smaller city having extensive coal mining and ceramic industries; the Orting branch extending to Puyallup, the center of a large berry and fruit district, and a short feeder serving the packing house district of Tacoma, known as the Tide Flats line. The company also owns the East P. Street line in the city of Tacoma, and what is known as the old Puyallup line, but as both of the latter are leased and operated by the Tacoma Railway & Power Co., they are not considered part of the system. The company also owns several lighting franchises in cities along the line, as well as a large tract of timber land, and a saw mill which is operated for commercial purposes. This road, as well as the street railway systems of Seattle and Tacoma, are owned by Stone and Webster, with their associates, being managed by the former.

The main line extends from the city limits of Seattle to the city limits of Tacoma, a distance of 32.01 miles, entrance to the business centers of the cities being obtained over the tracks of the Tacoma Railway & Power Co. and the Seattle Electric Co. The track mileage owned and operated was as follows on June 30, 1909:

Main Track:	Miles.
First track, main line	32.01
Second track, main line	10.91
Orting branch	6.94
Renton branch	2.96
Tide Flats line	0.58
Total main track	53.40
Sidings, etc.:	
On main line	8.24
On Orting branch	0.60
On Renton branch	1.38
On Tide Flats line	0.13
Total sidings, etc.	10.35
Grand total	63.75

On the main line, between Seattle and Tacoma, consisting of 42.92 miles of first and second track, there are 7.30 miles of curved track. The total ascent is 356 ft., and the total descent is 409 ft. About 7 miles of the line was built on trestles.

The main line and Renton branch were built in 1902, the Tide Flats line in 1904, the Orting branch in 1908, and the second track over a period from 1904 to 1909. The population of Seattle is about 250,000, Tacoma, 150,000, while the country tributary to the line contains approximately 15,000 people, many of whom own small tracts adjacent to towns, working in Seattle and Tacoma, going to and from their work each day. All of the larger towns on this road are also served by two steam roads charging 3 cts. per mile, while Seattle and Tacoma have boat service at intervals of two hours, the boat fare being 35 cts. one way or 50 cts. for the round trip.

The rates inaugurated by the Puget Sound Electric Ry. ranged from 1½ cts. to 2 cts. a mile, the rate between Seattle and Tacoma being 60 cts. one way or $1 for the round trip, in addition to which, transfers were given and accepted at each end of the line. Hourly service was maintained between all points, with an extra 30 minute service morning and evening. Under these conditions the valley traversed by this line settled rapidly, many small towns and villages springing up.

*Engineer, The Railroad Commission of Washington, Olympia, Wash.

The land became quite valuable for small fruit raising, truck gardening and dairying, the values ranging from $100 to $1,000 per acre. Real estate firms acquired large tracts and disposed of them in smaller tracts of from one to five acres, selling them on monthly payments to clerks and artisans employed in the terminal cities, whose intention it was to use their spare time building up small vegetable or berry gardens and ultimately devoting their entire time to such work.

On Oct. 17, 1909, shortly after the close of the successful A. Y. P. Exposition, the company put into effect a new schedule of rates, charging a flat rate of 2 cts. a mile between all points and a round trip rate of $1.25 between Seattle and Tacoma. Almost immediately after the new tariff was filed, complaint was made to the Railroad Commission of Washington, alleging that the increased rates were unreasonable and excessive, that they were confiscatory in as much as the patrons of the road could no longer afford to live at such a distance from their work, but would be compelled to dispose of their property at a loss and move into the cities. It was also charged that a great many people had been induced to settle in the small towns along the line by the representation that the rates would never be raised, and it was further charged that the officials of the company had stated publicly that instead of raising the rates, they intended to lower them. Whereupon a citation was issued challenging the increased rates, making the company defendant, and an investigation was begun to determine the value of the property used by the defendant as a common carrier. The laws of Washington provide that in fixing the value of a railroad, the Railroad Commission shall give due consideration to the cost of construction, cost of reproduction, depreciated value, amount and market value of stocks and bonds, probable earning capacity, density of population, physical characteristics and any other matters that may effect the value. The writer had charge of the investigation, particularly of the determination of the original cost, cost of reproduction and depreciated value. The methods employed were practically the same as those used during the appraisal of the steam roads and, as a description of that work has appeared in these columns, the writer will not describe the manner of conducting the work in question in great detail.

As in the case of the valuation of the steam roads, finding the actual cost consumed the major portion of the time. It is an astonishing fact that, with one exception, there has never been a railroad under investigation by the Railroad Commission of Washington which could readily give the cost of construction, and, in many cases, little or no record of such cost existed. Fortunately, however, there are other records besides books or company records, and this important item has invariably been determined to the satisfaction of all concerned. In the present case the property account represented only the face value of stocks and bonds which had been issued in payment for the construction of the road, the records of the original construction being missing from the general offices in Tacoma and there being some doubt as to their existence. Acting upon the theory that no help was to be had from the Boston office, every vault and out of the way place in the Tacoma office was carefully explored. Several old letter files, found in a dark corner of an unused vault, proved to be mines of information, one of them con-

taining a complete itemized statement of the cost of the road at the time it was turned over to the operating department. The rest was easy, and was made even more so by the arrival of a similiar statement from the Boston office, checking the statement found in Tacoma. The writer mentions this incident for the reason that it is a parallel to the manner in which the original cost was obtained for almost every railroad in the State of Washington.

Similar conditions existed in the engineering department. Owing to the general scheme of construction, which contemplated payment for work with stocks and bonds, no quantities or final estimates were available. A thorough examination was made of the entire line, cross sections were taken where the profile could not be relied upon to indicate the grading quantities; material in cuts was classified, buildings and bridges measured up and examined, and in short, all data possible were compiled in the field. The existing office records were compared with the field notes and a fairly close check resulted. The grading quantities were obtained partly from a profie estimate and partly from the cross sections taken in the field. The material in the cuts was classified according to the field inspection and the over-haul computed from the profile. The statement of track material was taken from the office records, which checked the field notets closely. The bridge and building lists were compiled from the field notes, as the office records were not complete. Ballast was the subject of much discussion and was a source of disagreement. An itemized statement of the transmission and distribution systems prepared by the Superintendent of Power was of great assistance, checking the field notes closely. The Master Mechanic provided a list of equipment which was of great aid. Except in the case of grading and ballast, no difference existed between the statements of quantities compiled by the engineers of the railway and those of the Commission, while every disposition was shown to aid the latter.

Proceeding upon the theory that what a thing cost is at least good evidence of what it might cost again, the records of the auditor's office were closely examined and all improvement requisitions scrutinized. The purchasing agent was in great demand, for while the engineers engaged in this work were, from much experience, familiar with the cost of material, yet prices fluctuate and it is frequently the case that a small road is compelled to pay more for its supplies than a larger one, and these things should be taken into consideration. A great deal of information was obtained from the old letter files previously referred to; for instance, they contained an itemized statement of the cost of track laying. Officers of the company were freely consulted, as it was the desire to compile a fair statement of quantities involved, and to show the actual prices which would prevail should the road be reconstructed.

The cost of reproducing the right of way and real estate was arrived at in exactly the same manner as in a condemnation suit. Lists were prepared, with the necessary maps, and furnished to real estate experts, who walked over the line valuing each piece of right of way on the basis of the value of the contiguous property, regardless of the fact that the presence of the railroad lent value to such property. These lists, with the alloted value shown thereon, were introduced as evidence. Testimony was then taken as to the value of such property for railroad purposes, which showed clearly that it was necessary to multiply the land value by a factor, in order to arrive at the cost of repurchasing the property for railroad purposes. This factor ranged from 1 to 5, depending altogether upon the location and value, city property requiring a factor of about 1½, first-class farm property, about 2½, while land which was practically worthless, required a factor nearer 5. The smaller the value of the land, the higher the factor. After considering the testimony of the experts on both sides, and reviewing possible consequential damages, the cost of reproducing the right of way and real estate was fixed. As the road owns very little city property, practically all of the sum shown as the cost of reproduction of right of way and real estate, represents the former, so that the average cost of reproduction per acre was about $1,250. As the average value of the contiguous property was about $500, the average factor was approximately 2½. It is a commendable fact that the estimate made by the railroad officials was smaller than that made by the real estate experts employed by the Commission.

During the appraisal of the steam roads, of the state, it was established that 3½ per cent of the total cost of construction was an ample allowance for engineering, and that 1 per cent of such cost was sufficient to cover expenditures for legal and general expense. But as the construction of this road presented no difficult engineering problems, it was considered that, in this case, 3 per cent would be a liberal allowance for engineering; but it developed that in addition to the sum expended for local engineering, Stone and Webster had received an additional 10 per cent as an engineernig commission. The matter of an engineering commission had not presented itself before, the steam roads, who were not supposed to over-look anything, contending for a total allowance of only 5 per cent for engineering. It was a well known fact, however, that such a charge was by no means unusual, but it was apparent that such a commission was not a strictly "engineering commission," but really covered the cost incident to purchasing supplies and expenses of management during construction, and was in a way a fee for procuring the funds for the construction, so that the only doubt was under which head to include such commission, which was finally shown under the account "Fiscal and Physical Supervision and Management." In accordance with the usual custom, 1 per cent was allowed for "Legal and General Expense" and 5 per cent for "Contingencies." The latter item was a source of much contention, the railway claiming that 10 per cent should be allowed. It was held, however, that, as the quantities were known, and as prices were very liberal and had been fixed after due consideration of the cost, and that as allowance had been made for extra work, and for other items of expense which could not be estimated, many of the contingencies which might be met with had been taken care of in the estimate, so that 5 per cent was a fair allowance in such a case.

The amount of cash and the approximate value of the stores on hand at the time of the inquiry were allowed under the account "Stores and Working Capital," the same being approximately 10 per cent of the estimated cost of reproduction, which was the percentage recommended by the writer. Interest at 5 per cent per annum was allowed, it being considered that 1½ years would be required in which to construct the road. This item amounted to 7½ per cent on the cost of reproducing the right of way and one-half of this, or 3¾ per cent on the remaining construction items, as the sum invested in the latter would only be required for an average of one-half the time. The lighting system, both physically and financially, was so closely interwoven with the railway, that it was deemed inexpedient to attempt to separate them, so it was allowed as representing part of the cost of reproducing the system. The locomotives and motor car had been purchased second hand, hence the cost of reproducing them second hand was allowed, rather than the cost of reproducing them new.

Probably the most thoroughly contested point was "Discount," the railroad engineers contending that 10 per cent of the total estimated expenditure should be allowed to cover this item, and should be included in the cost of reproduction. It was shown that the bonds had sold at 85 while stock was given with the bonds as a bonus, but the Commission held that when a railroad was built entire from the sale of bonds, it ceased to be an investment, and became a speculation; that in such a case it was doubtful if the stock was entitled to *any* return. Testimony was introduced showing that if 25 per cent of the stock of a legitimate enterprise was paid up; that the bonds would without question sell at par, while the entire expense in connection with the sale of such bonds would not exceed 5 per cent; hence 5 per cent of 75 per cent of the total estimated expenditure was allowed as "Broker's Fees."

The depreciated value was arrived at by the combined use of mortality tables and by field inspection, and represents the cost of reproduction less depreciation. The cost of reproducing the different items, for example, pile bridges, was determined, and the average life and age being known, the depreciation in dollars was easily obtained. The possible scrap value of material was taken into account, as in the case of rails, which were assigned a life of 20 years, with a scrap value of 40 per cent, or an annual depreciation of 3 per cent. Trolley wire was assigned a life of 10 years, during which time it was considered that it would wear 25 per cent, having a scrap value of 60 per cent, hence the actual scrap value would be only 45 per cent, and the annual depreciation 5½ per cent. Substation equipment was carefully inspected, and found to be practically new after seven years use, but as obsolescence and inadequacy are forms of depreciation and may be expected to play a part, an annual depreciation of 5 per cent was allowed for this item.

The statement of original cost and the estimated cost of reproduction and depreciated value were prepared by the writer with the assistance of one engineer and a stenographer, the time required being about two months. Four real estate men were also engaged about ten days. The actual cost of the work to the state was approximately $2,000, divided about equally between the engineers and the real estate experts. The cost per mile of road is not representative, as to the length of a railroad is no measure of the cost of appraising it. It costs very little more to appraise a long road than a short one, but it is the number of different estimates that count. In this case it was deemed expedient to prepare a detailed estimate, not only of the Puget Sound Electric Ry. proper, but also for the Lighting System, the East P. Street line and the old Puyallup line, although the last two were not considered part of the system; hence four estimates were made instead of one, for roads aggregating only 65 miles, while the 500 miles owned by the Oregon Railway & Navigation Co. within the state, were appraised for approximately $4,000. It is also possible to handle several roads at the same time at a cost considerably less than the aggregate cost of handling each separately.

The actual original cost of the road was found to be $3,647,018, which included $407,234, advanced for working capital and $305,929 of discount, leaving a net cost of $2,933,855.

In fixing the cost of reproduction the Railroad Commission regards its engineer simply in the light of a witness, and is not bound by his testimony, hence it is not uncommon for quantities or prices to be increased or decreased after hearing to the testimony of the defendant's witnesses. Many questions are simply matter of opinion and depend upon the point of view. The following table includes all items and shows the total estimated cost of reproduction and depreciated value as made by the engineers and the sum fixed by the Commission in their findings:

	Engineer Railroad Com.	Engineer Railroad Company.	Allowed by Railroad Com.
Cost of reproduction	$3,943,750	$5,123,173	$4,157,558
Depreciated value	3,352,463	4,424,395	3,598,232

TABLE I.—COST OF REPRODUCING NEW THE PUGET SOUND ELECTRIC RY.

(June 30, 1909.)

1. Right of Way and Real Estate	$417,733
2. Engineering and Superintendence: 3% of Items 4 to 27	53,336
3. Fiscal and Physical Supervision: Amount expended	186,955

4. Grading:
610,000 cu. yds. common excava., at 0.25 152,500
47,500 cu. yds. common long haul, at 0.095 4,512
150,000 cu. yds. hard pan, at 0.45 67,500
1,150 cu. yds. solid rock, at 1.10 1,265
700,000 cu. yds. overhaul 100 ft. at 0.01 7,000
133 acres clearing at 60.00 7,980
580 stations grubbing at 15.00 8,700
200 dangerous trees cut at 2.00 400
Ditching and miscel. 2,000
Total grading $251,857

5. Ballast:
46.35 miles gravel at 1,100.00 $ 50,985

6. Ties
157,857 ties (6X8X8) at 0.35 $ 55,207
16,636 ties (6X8X9) at 0.40 6,658
Total ties $ 61,865

7. Rails, Fastenings and Joints:
5,292.8 tons 30-ft. steel rails at 39.50 $209,066
1,409.1 tons 60-ft. steel rails at 41.50 58,478
14,584 Weber joints (60 and 70-lb.) at 2.50 36,460
1,327 American continuous joints at 2.10 2,859
106,596 lbs. angle bars (56 and 60-lb.) at 0.03 3,198
25,240 lbs. fish plates (30, 40 and 42-lb.) at 0.025 631
10,304 lbs. track bolts (¾x3¾) at 0.0325 335
2,574 lbs. track bolts (⅝x2½) at 0.0325 85
269,206 lbs. spikes (9 10x5½) at 0.0225 8,325
2,000 braces at 0.10 200
3,010 lin. ft. guard rail at 0.50 1,505
Total rails, fastenings and joints $321,136

8. Frogs and Switches:
66 spring frogs (70-lb.) at 50.00 $ 3,300
22 rigid frogs (70-lb.) at 30.00 660
22 rigid frogs (60-lb.) at 30.00 660
16 rigid frogs (50-lb.) at 25.00 400
13 rigid frogs (40-lb.) at 20.00 260
72 split switches complete (70-lb.) at 40.00 2,880
12 split switches complete (60-lb.) at 35.00 420
1 split switch complete (50-lb.) at 25.00 25
6 split switches complete (40-lb.) at 15.00 90
8 sets head chairs at 4.00 32
8 sets tie bars at 10.00 80
59 high stands at 25.00 1,475
2 low stands at 18.00 36
20 ground throws at 10.00 300
139 guard rails at 10.00 1,390
47 loose tongue switches at 50.00 2,350
3 derails at 6.00 18
59 switch lamps at 5.00 295
61 switch locks at 0.50 31
5 crossing frogs at $300.00 1,500
Total frogs and switches $ 16,201

9. Laying:
1,096,630 ft. B. M. fir planking at 16.00 $ 17,546
140 kegs wire spikes at 3.00 420
40,000 ft. B. M. wood filler at 24.00 960
600 cu. yds. broken stone at 1.50 900
Total paving $ 19,826

10. Track Laying and Surfacing:
63.75 miles track at 700.00 $ 44,625
119 frogs and switches placed at 25.00 3,475
5 crossing frogs placed at 25.00 125
Total track laying and surfacing $ 48,225

11. Tunnels:
180 lin. ft. timber lined at 65.00 $ 11,700

12. Bridges, Trestles and Culverts:
210 lin. ft. span bow steel truss (on cylinder piers) at 100.00 $ 21,000
72 lin. ft. span deck girder (pile abuts.) at 50.00 3,600
60 lin. ft. span I-beam (pile abuts.) at 30.00 1,800
220 lin. ft. span combination (2 spans of 110 ft. cylinder piers) at 55.00 12,100
150 lin. ft. span combination (pile abuts.) at 45.00 6,750
150 lin. ft. span combination (cylinder piers) at 47.00 7,050
200 lin. ft. span Howe truss draw (on pile crib) at 65.00 13,000
190 lin. ft. span Howe truss draw (on pile crib) at 65.00 12,350
120 lin. ft. span Pony Howe truss (pile abuts.) at 30.00 3,600
80 lin. ft. span Pony Howe truss (pile abuts.) at 25.00 2,000
87 line ft. span Pony Howe truss (pile abuts.) at 27.00 2,349
60 lin. ft. span Pony Howe truss (pile abuts.) at 20.00 1,200
361,612 lin. ft. piles in place at 0.25 90,403
39,256 lin. ft. piles cut off at 0.10 3,925
4,889,386 ft. B. M. timber in trestles at 28.00 136,903
166,451 lbs. wrt. iron in trestles at 0.035 5,826
121,515 lbs. cast iron in trestles at 0.035 3,645
150 lin. ft. of 12-in. vitrified pipe at 1.00 150
272 lin. ft. of 14-in. vitrified pipe at 1.25 340
659 lin. ft. of 15-in. vitrified pipe at 1.35 889
802 lin. ft. of 16-in. vitrified pipe at 1.50 1,203
1,364 lin. ft. of 18-in. vitrified pipe at 1.45 1,977
42 lin. ft. of 24-in. vitrified pipe at 2.90 122
8,382 ft. B. M. timber in wooden boxes at 25.00 210
8,281 lin. ft. logs in culverts at 0.12 994
River bank protection, Black River, cost 1,857
Fill and dam, Puyallup River, cost 4,000
2,000 cu. yds. riprap at 1.25 2,500
Total bridges, trestles and culverts $344,553

13. Crossing, Fences, Cattle Guards and Signs:
82,615 ft. B. M. timber in crossings at 20.00 $ 1,652
146,233 ft. B. M. timber in inclines to grade crossings at 27.00 3,948
1,074 lbs. wrt. iron, in inclines, at 0.035 38
210 lbs. cast iron, in inclines, at 0.035 6
30 kegs wire spikes, in inclines, at 3.00 90
9,650 ft. B. M. timber in farm crossing inclines, at 25.00 241
3 kegs wire spikes in ditto at 3.00 9
54 single miles board fence at 450.00 24,300
8 single miles comb. woven and wire fence at 300.00 2,400
1,960 lin. ft. tight board fence at 0.56 1,097
150 board gates at 3.00 450
82 cattle guards, Trackman, at 25.00 2,050
207 cattle guards, Bartlett, at 20.00 4,140
13 danger signs at 2.00 26
196 warning signs at 2.00 392
28 railroad crossing signs at 5.00 140
3 station signs, single, at 10.00 30
35 electric rail signs at 3.00 105
38 "stop, look, listen" signs at 1.00 28
4 yard limit signs at 4.00 16
3 city limit signs at 1.00 3
31 whistle posts at 1.00 31
19 S. posts at 1.00 19
Total crossings, fences, etc. $ 41,508

14. Interlocking and Signal Apparatus:
38 platform stop signals at 8.00 $ 304
3 train order signals at 20.00 60
2 block light sets at 275.00 550
Total interlocking and signal $ 914

15. Telegraph and Telephone Lines:
53 cedar poles, 45-ft., at 4.50 $ 238
66 cedar poles, 40-ft., at 3.80 251
1,675 cross arms (4 pin) with hardware at 0.80 1,340
316 cross arms (6 pin) with hardware at 1.00 316
15,312 lbs. telephone wire No. 10 copper at 0.18 2,756
13,300 lbs. telegraph wire No. 9 bare iron at 0.06 798
1,750 lbs. telegraph wire No. 10 W. P. at 0.07 122
5,886 double petticoat insulators with pins at 0.07 412
11 telegraph keys at 1.05 12
10 telegraph sounders at 5.25 52
14 telegraph relays at 4.20 59
6 telegraph box relays at 4.25 25
12 telegraph cut outs at 1.25 15
Telephone switchboard, cost 275
Telephone storage battery, cost 25
Labor 2,500
Total telegraph and telephone lines $ 9,196

16. Poles and Fixtures:
1,544 transmission poles, 50-ft. cedar, at 5.50 $ 8,492
28 transmission poles, 70-ft. cedar, at 11.25 315
603 trolley poles, 30-ft., at 2.55 1,538
324 trolley poles, 40-ft., at 3.80 1,231
1,635 transmission cross arms, 2 pin, with hardware, at 0.70 1,144
1,572 feeder cross arms, 4 pin, with hardware, at 0.80 1,258
316 feeder cross arms, 6 pin, with hardware, at 1.00 316
57 guy wire clamps, galv., 3-bolt, at 0.12 7
14 line anchor clamps, mal. galv., at 0.50 7
82 anchor rods at 0.50 41
Labor 14,979
Total poles and fixtures $ 29,328

17. Transmission System:
25,050 lbs. transmission line wire, bore 1-0, at 0.18 $ 4,509
6,516 lbs. transmission line wire, bore No. 1, at 0.18 1,172
54,534 lbs. transmission line wire, bore No. 4, at 0.18 9,816
3,425 insulator pine at 0.40 1,370
1,607 pole brackets at 0.40 643
5,025 insulators at 1.50 7,538
Miscel. material 500
Labor 4,000
Total transmission system $ 29,548

18. Distribution System:
72 cut out switches, 50 amp. Q. B., at 9.00 $ 648
66,598 lbs. 3d rail crossg. cables W. P. 500 M. C. M. at 0.18 11,888
2,353 lbs. 3d rail crossg. cables W. P. 300 M. C. M. at 0.18 424
765 lbs. 3d rail feed taps W. P. 500 M. C. M. at 0.18 138
371 lbs. 3d rail feed taps W. P. 300 M. C. M. at 0.18 67
300 lbs. 3d rail feed taps W. P. 100 M. C. M. at 0.18 54
74,470 lbs. overhead feeders, bare, 500 M. C. M. at 0.18 13,405
137,529 lbs. overhead feeders, bare, 300 M. C. M. at 0.18 24,755
9,119 lbs. overhead feeders, W. P., 500 M. C. M. at 0.18 1,641
4,787 lbs. overhead grounds, W. P., 500 M. C. M. at 0.18 862
900 lbs. overhead grounds, W. P., 300 M. C. M. at 0.18 162
613 lbs. cross bars, frogs and switch jumpers, W. P., 500 M. C. M. at 0.18 110
1,142 lbs. ditto, W. P., 300 M. C. M. at 0.18 206
335 lbs. ditto, W. P., 4-0 M. C. M. at 0.18 60
16,900 running rail bonds main line at 0.50 8,450
1,200 running rail bonds 212 B. B. at 0.44 528
304 running rail bonds "A" 4-0 at 0.37 112
6,745 third rail bonds at 1.28 8,634
16,863 third rail insulators at 0.88 14,839
2,935 tons third rail (30-ft., 100-lb.) at 39.50 115,933
252 third rail noses at 2.00 504
504 nose fish plates at 0.70 352
12,800 third rail fish plates at 0.24 3,072
32,000 lbs. third rail bolts at 0.03 960
55,432 lbs. trolley wire 4-0 at 0.18 9,978
11,290 lbs. trolley wire 2-0 at 0.18 2,032
4,880 lbs. trolley wire 1-0 at 0.18 878
38,000 ft. Siemens-Martens steel cable, 7/16-in., at 0.0315 1,197
2,000 ft. Siemens-Martens steel cable, ⅜-in., at 0.027 54
3,000 ft. Siemens-Martens steel cable, ¼-in., at 0.025 75
16,000 ft. signal strand, ¼-in., at 0.0083 133
32,650 ft. signal strand 5/16-in., at 0.011 359
1,000 ft. signal strand, ⅜-in., at 0.013 13
1,639 eye bolts at 0.12 197
1,542 wood strain insulators, G. E., at 0.23 355
80 wood strain insulators, home made, at 0.25 20
240 single curve hangers at 0.51 122
180 double curve hangers at 0.57 85
588 straight line hangers at 0.51 300
1,888 cable insulators with pine at 0.23 434
659 ears, 2-0, at 0.30 198
165 ears, single 0, at 0.25 41
171 ears, 4-0 at 0.35 60
35 trolley frogs at 3.50 123
339 T bar pole brackets at 2.50 848
16 Richmond flexible pole brackets at 2.50 40
53 steady bar bracket attachments at 3.40 180
3,997 messenger clips, ⅝-in. mal. galv., at 0.06 240
3,956 Detroit "Form 2" clamps, ⅝-in. mal. galv., at 0.10 360
46 Detroit "Form 5" clamps, ⅝-in. mal. galv., at 0.20 9
46 strain collars, ⅝-in., at 0.038 2
645 steel hanger rods, galv., ⅝x13½, at 0.03 19
18 steel hanger rods, galv., ⅝x13½, at 0.075 1
645 hangers, galv., ⅝x4, 120 ft. span, at 0.032 21
616 hangers, galv., ⅝x5½, 120 ft. span, at 0.038 23
645 hangers, galv., ⅝x7½, 120 ft. span, at 0.045 29
645 hangers, galv., ⅝x9¾, 120 ft. span, at 0.053 34
645 hangers, galv., ⅝x12¾, 120 ft. span, at 0.066 43
29 hangers, galv., ⅝x5½, 120 ft. span, at 0.047 1
31 hangers, galv., ⅝x7½, 100 ft. span, at 0.053 2
16 hangers, galv., ⅝x8¾, 100 ft. span, at 0.059 1
16 hangers, galv., ⅝x10½, 100 ft. span, at 0.065 1
16 hangers, galv., ⅝x13½, 100 ft. span, at 0.075 1
18 hangers, galv., ⅝x11¾, 60 ft. span, at 0.07 1
18 hangers, galv., ⅝x12¾, 60 ft. span, at 0.073 1
92 wood brake strain insulators, 1¼x14, at 0.18 17
18 Crosby clips, ⅜ in., at 0.08 1
57 Crosby clips, 7/16 in., at 0.09 5
15 trolley wire connections, brass, 2x⅞, 4-0 grvd., at 1.10 17
339 porcelain messenger insulators, 10,000 v., 1¾ pin hole, at 0.15 51
4 overhead switches at 12.50 50
100,165 ft. B. M. timber, cable boxes, at 10.00 1,002
Miscellaneous material 500
Labor 25,000
Total distribution system $253,065

19. Substation Buildings:
122,708 cu. ft. brick bldg., at Kent, at 0.125 $ 15,338
28,940 cu. ft. frame bldg., at Kent, at 0.10 2,894
87,030 cu. ft. brick bldg., at Milton, at 0.125 10,879
28,940 cu. ft. frame bldg., at Milton, at 0.10 2,894
84,820 cu. ft. brick bldg., at Puyallup, at 0.125 10,602
Total substation buildings $ 42,607

20. Shops and Car Houses:
8,568 sq. ft. corrugated iron car sheds, at 0.45 $ 3,855
19,248 sq. ft. frame car sheds, at 0.50 9,624
2 sets track scales, at 1,300.00 2,600
Total shops and car houses $ 16,080

21. Stations and Miscellaneous Buildings.
Brick and frame station, Tacoma $ 4,000
2,850 sq. ft. frame station, 2 story, at 2.00 5,700
5,728 sq. ft. frame stations, bungalow type, at 1.25 7,160
8,318 sq. ft. frame stations, old standard, at 1.00 8,318
108 sq. ft. open sheds, at 0.50 54
2,396 sq. ft. frame freight sheds, at 0.90 2,156
1,060 sq. ft. corrugated iron freight sheds, at 0.50 530
478 sq. ft. miscellaneous frame sheds, at 0.50 239
216 sq. ft. telephone shacks, at 0.50 108
306 sq. ft. tool sheds, at 0.50 153
372 sq. ft. section house, at 0.50 186
64,111 sq. ft. low passenger platforms, at 0.10 6,411
5,875 sq. ft. high passenger platforms, at 0.15 881
4,562 sq. ft. freight platforms, at 0.15 684
3,909 sq. ft. milk platforms, at 0.20 782
8 water closets, at 50.00 400
Total stations and miscel. bldgs. $ 44,211

22. Substation Equipment:
3 lightning arresters, 50,000 volt, 3 pole, at 621.00 $ 1,863
5 oil switches, 50,000 volt, type H, at 1,600.00 8,000
212 Thomas insulators, 50,000 volt, at 1.85 392
36 disconnecting switches, 50,000 volt, at 41.50 1,494

494 lbs. bare copper wire, at 0.18	89
7 oil cooled transformers, 200 k. w., at 2,300.00	16,100
4 oil cooled transformers, 180 k. w., at 1,000.00	4,000
4 current transformers, 50,000 volt, at 150.00	600
3 inducting motor generator sets, 300 k. w., with non-automatic, double pole oil switches, 2,300 volts and 600 volt, generator panels (1 slate and 2 marble), at 8,500.00	25,500
2 automatic oil switches, 4 pole st. 300 ampere with slate slabs and 2 current transformers, at 140.00	280
3 H. E. Ind. volt meters, with potential transformers, at 85.00	255
6 railway feeder panels, marble, at 200.00	1,200
1 lightning panel, marble 16 in.	100
1 lightning panel, marble 24 in.	300
2 C. R. regulators at 315.00	630
2 booster transformers, 3 k. w., at 47.50	95
2 booster transformers, 5 k. w., at 66.50	133
1 polyphase recording watt meter, 300 amp., and two 200 watt potential transformers, and 2 current transformers 300-5 amp.	200
1 T. R. watt meter, 800 amp., 600 volt	175
1 induction motor panel, 2,300 volts	290
40 ft. lead covered insulated cable, 500 M. C. M., at 0.91	36
400 ft. lead covered insulated cable, No. 2, at 0.90	360
80 ft. lead covered insulated cable, No. 4, at 0.30	24
147 ft. weather proof cable, 800 M. C. M., at 0.60	86
509 ft. weather proof cable, 500 M. C. M., at 0.45	229
540 ft. rubber covered cable, No. 2, at 0.08	40
26 ft. rubber covered cable, 500 M. C. M., at 0.65	17
2 50,000 volt, 150 to 50 current transformers, at 300.00	600
1 motor panel, 24 in. marble, 2,300 volt, with automatic oil switch, 300 amp., 4 pole st.	290
1 T. R. watt meter, polyphase, 300 amp., with 2,300 to 5 current transformers	200
1 T. R. watt meter, 800 amp., 600 volt	175
5 oil switches, 3 pole, 30,000 volts, at 400.00	2,000
9 disconnecting switches, 30,000 volts, at 20.00	180
30 Westinghouse air brake jacks and slabs, at 8.00	240
30 marble barriers for same, at 30.00	900
3 lightning arresters, 3 pole, 30,000 volts, at 100.00	300
3 generator panels, slate 16 in., at 200.00	600
3 slate slabs and switch handles, at 20.00	60
6 feeder panels, 16 in. plate, at 50.00	300
1 slate slab with synchronizer	55
2 front connected feeder switches, at 20.00	40
10 current transformers, 30,000 volt, at 125.00	1,250
8 potential transformers, at 150.00	1,200
1 compensator for 180 k. w. transformers, 17½ k. w.	275
318 lbs. bare copper wire, at 0.18	57
Miscellaneous equipment	500
3 air compressors and receiving tanks with 4. h. p. motors, at 300.00	900
Labor of installing transformers and generators in 3 substations	3,400
3 storage battery sets consisting of chloride accumulators (288 cells of 15 plates per cell; 288 cells of 17 plates per cell; 288 cells of 17 negative plates per cell); 428 ft. lead covered rubber insulated cable, 3 booster sets, 35 k. w.; 6 marble battery panels; including freight and installation	106,149
Total substation equipment	$182,159
23. Shop Equipment:	
1 sharper, 20 in.	$ 250
1 radial drill, 24 in.	150
1 metal lathe, 20 in. x 12 ft.	570
Miscellaneous hand tools	30
Total shop equipment	$ 1,000
24. Water Stations:	
2 box tanks, 6x7x16 ft., at 100.00	$ 200
Pumping plant and pipe	200
Total water stations	$ 400
25. Engineering Instruments and roadway tools	$ 1,500
26. Legal and General Expanse:	
1% of items 4 to 25	$ 17,779
27. Interest During Construction:	
7½% of item 1, and 3¾% of items 2 to 26	$145,181
28. Contingencies:	
5% of all above items, exclusive of items 1, 3 and part of 27 (interest on right of way)	$ 96,266
29. Stores and Working Capital:	
Cash and stores on hand June 30, 1909.	$ 300,000
Total construction	$3,495,154
30. Cars (exclusive of electric equip.):	
9 combination baggage and coach, at 6,206.60	$ 55,860
5 passenger cars, at 4,160.00	20,530
4 motor trailers, at 5,500.00	21,000
11 trailers, at 5,025.50	55,280
4 observation cars, at 10,290.00	41,160
4 race track cars, at 2,625.00	10,500
22 box cars, freight, at 729.50	16,050
25 hopper cars, freight, at 675.00	16,875
14 gondola cars, freight, at 668.00	9,350
97 flat cars, freight, at 558.00	54,126
2 freight motor cars, box type, at 3,000.00	6,000
3 freight motor cars, cab type, at 2,500.00	7,500
1 derrick car	1,200
1 pile driver	1,500
1 steam shovel	10,000
Total cars, etc.	$326,931
31. Locomotives:	
1 Baldwin, No. 1 steam, second hand	$ 2,500
1 Manchester, No. 2 steam, second hand	2,500
1 Hinkley, No. 3 steam, second hand	2,500
Total locomotives	$ 7,500
32. Electric Equipment of Cars:	
8 General Electric No. 66, 4 motor equipments, at 7,575.00	$ 60,600
4 General Electric No. 66, 2 motor equipments, at 4,000.00	16,000
2 General Electric No. 205, 4 motor equipments, at 7,000.00	14,000
4 General Electric No. 90, 4 motor equipments, at 3,200.00	12,800
4 Westinghouse Electric No. 49, 2 motor equipments, at 1,200.00	4,800
5 General Electric No. 66, freight motor equipment, at 7,500.00	37,500
Total electric equipment of cars	$145,700
33. Miscellaneous Equipment:	
1 Packard touring car, second hand	$ 2,000
Total equipment (items 30 to 33)	$ 482,131
Total construction and equip.	$3,977,285
34. Lighting system	$ 30,000
35. Brokerage Fees:	
5% of 75% of above	$ 150,273
Grand total	$4,157,558

Item 35 was allowed on the assumption that if bankers had to provide only 75 per cent of the cash used in construction and equipment (the balance being furnished by the promoters), a reasonable brokerage fee would be 5 per cent of the cash thus secured.

Item 31, "Locomotives," relates to locomotives worth $8,000 new, but purchased second hand.

TABLE II.—DEPRECIATED VALUE OF THE PUGET SOUND ELECTRIC RY.

(June 30, 1909.)

1. Right of way and real estate	$ 917,775
2. Engineering and superintendence	53,336
3. Fiscal and physical supervision and management	186,955
4. Grading (incl. 10% appreciation of roadbed)	275,135
5. Ballast (15% depreciation)	43,337
6. Ties (70% depreciation)	18,559
7. Rails, fastenings and joints (15% deprec.)	272,966
8. Frogs and switches (20% deprec.)	12,961
9. Paving (56% deprec.)	9,913
10. Track laying and surfacing (30% deprec.)	33,753
11. Tunnels (5% deprec.)	11,115
12. Bridges, trestles and culverts (48% deprec.)	179,168
13. Crossings, fences, cattle guards and signs (46% deprec.)	22,414
14. Interlocking and signal apparatus (35% deprec.)	594
15. Telegraph and telephone lines (30% deprec.)	6,437
16. Poles and fixtures (43% deprec.)	16,717
17. Transmission system (no deprec.)	29,548
18. Distribution system (7% deprec.)	235,350
19. Substation buildings (10% deprec.)	38,346
20. Shops and car houses (20% deprec.)	12,864
21. Stations, waiting rooms, etc. (19% deprec.)	35,811
22. Substation equip. (27% deprec.)	132,976
23. Shop equipment (50% deprec.)	509
24. Water stations (60% deprec.)	169
25. Eng. insts. and tools (50% deprec.)	750
26. Legal and general expense	17,779
27. Interest during constr.	145,181
28. Contingencies	96,266
29. Stores and working capital	300,000
Total construction	$3,106,669
30. Cars (35% deprec.)	$ 212,505
31. Locomotives (4% deprec.)	7,200
32. Elec. equip. of cars (35% deprec.)	94,705
33. Miscel. equip. (16% deprec.)	1,680
Total equip. (items 30 to 33)	$ 316,090
Total construction and equip.	$3,422,759
34. Lighting system (16% deprec.)	25,200
35. Brokerage fees	150,273
Grand total	$3,598,232

TABLE III.—COST OF REPRODUCTION NEW PER MILE OF TRACKWAY.

(53.4 miles of trackway.)

1. Right of way and real estate	$17,182
2. Engineering and superintendence	999
3. Fiscal and physical supervision	3,502
4. Grading	4,717
5. Ballast	955
6. Ties	1,159
7. Rails, fastenings and joints	6,015
8. Frogs and switches	304
9. Paving	370
10. Track laying and surfacing	903
11. Tunnels	219
12. Bridges, trestles and culverts	6,454
13. Crossings, fences, cattle guards and signs	777
14. Interlocking and signal appar.	17
15. Telegraph and telephone lines	171
16. Poles and fixtures	549
17. Transmission system	554
18. Distribution system	4,741
19. Substation buildings	797
20. Shop and car houses	302
21. Stations and miscel. buildings	828
22. Substation equipment	3,411
23. Shop equipment	19
24. Water stations	7
25. Eng. insts. and roadway tools	28
26. Legal and general expense	331
27. Interest during construction	2,718
28. Contingencies	1,805
29. Stores and working capital	5,618
Total construction, etc.	$65,452
30. Cars	6,123
31. Locomotives	140
32. Electric equip. of cars	2,729
33. Miscel. equipment	37
Total equipment	$ 9,029
Total construction and equipment	$74,481
34. Lighting system	562
35. Brokerage fees	2,815
Grand total	$77,858

The above costs are per mile of trackway (53.40 miles), but since there are 63.75 miles of all tracks, or 1.194 miles of track per mile of trackway, each of the above items must be divided by 1.194 (nearly 1.2) to ascertain the cost mile of track.

[An analysis of the findings of Railroad Commission indicates the following actual cost of this railway property, as taken from the accounting records of the company up to June 30, 1909:

1. Single track interurban line, up to April 1, 1903	$1,942,658
2. Subsequent expenditures on the original contract	11,064
3. Interest during construction	92,289
Total	$2,046,011
4. Additions and betterments	1,279,562
5. Working capital	407,489
Total	$3,733,062
Total	$3,713,374
Deduct construction of "P street line	19,688
Total	$3,713,374

Item 1 includes $186,955 paid Stone & Webster for "the engineering and supervising and acting as purchasing agents and managers during construction." Item 1 embraces the original 32.01 miles of single track line between Seattle and Tacoma, and the 2.96 miles of the Renton branch, a total of 34.97 miles of trackway.

The Commission inferred from the evidence presented, that the actual net cost of constructing and equipping the line, up to June 30, 1909, had been $2,933,864, for the Commission refused to include Items 2, 3 and 4 of the following schedule:

1. Construction and equipment	$2,933,864
2. Discounts on bonds, etc.	305,924
3. Damage due to floods after construction	44,099
4. Working capital	407,234
Total	$3,691,126

The total of this record schedule does not check exactly with the total of the first schedule just given, doubtless due to the elimination of some other items than those embraced in the "P Street line." It would appear that in the first schedule, Item 4, "Additions and Betterments," includes Item 2 of the second schedule, namely "Discounts on Bonds."

It will be noted that in the first schedule Item 3, "Interest During Construction," was not quite 5 per cent of the construction cost.

The Commission appraised the right of way and real estate at $917,733, as of June 30, 1909. The Commission states, however, that this is $770,000 in excess of what it actually cost the railway company.

It will be observed that no power plant is included in the appraisal. The railway company purchases its power, for which it "pays $2.23 per kilowatt per month for the full amount of 4,750 kilowatts delivered on the right of way." This, we take it, is based on a 24-hour service, and is therefore equivalent to 3.05 cts per. k. w. hr.; for $2.23 × 12 = $26.76 per year, and $26.76 ÷ 8,760 hrs. = 3.05 cts. If the railway operates on a "load factor" of 50 per cent (12 hrs. out of the 24), it follows that a power plant of 2 × 4,750 = 8,500 k. w. would be required.

The Commission states that on June 30, 1909, the railway reported $103,367 cash on hand, and $171,257 worth of materials and supplies and bond; hence its allowance of $300,000 as a reasonable sum.

We shall not abstract the Commission's discussion of what constitutes a reasonable return on the investment, but refer the read-

er to their bulletin No. 76, dated Feb. 26, 1910. The Commission ruled that a 7 per cent net return on the investment is liberal, and cited the case of Wilcox v. Consolidated Gas Co., 212 U. S. 19, before the Supreme Court of the U. S., as being such that "we would not be justified in allowing a less sum." Our own opinion, as expressed editorially elsewhere in this issue, is that it is not logical to determine reasonable profits by using the capital invested as the basis for such a determination.

The Commission held that $162,137 (or 25 per cent of the gross earnings) should be expended, or set aside from operating expenses, to cover the annual cost of maintenance and replacement. The actual amount spent in 1909 was $102,125. The Commission says: "The defendant company insists that not having provided a depreciation fund in the past it is entitled out of the traffic now moving to charge rates that will not only care for the average depreciation, but in addition make up the deficiency in this depreciation account accruing in the past." The Commission, however, did not uphold this contention, as will be seen in the syllabus that follows. We are of the opinion that their decision on this point will not be sustained if carried into the courts. In the absence of any previous governmental control of the accounting and managerial policy of this railway company, it certainly was free to elect any reasonable method to maintain its capital unimpaired. It chose to provide no sinking fund, which is the common practice among all railways, and it chose to meet the increasing maintenance expenses when actually called upon to do so, by the destruction of any part of its plant. If the company is now to be required to establish a sinking fund, there cannot be much doubt that it should be permitted to provide out of income for all future renewals of existing plant, regardless of the extent of its present depreciation. Otherwise, there can be no escape from permitting the company to make its renewals in lump sums, as fast as they must be made, charging such renewals to operating expenses, for that has been the immemorial custom of all American railways. Indeed, it may be soundly contended (see Gillette's "Handbook of Cost Data," second edition, Section I.) that a sinking fund is not a justifiable device where the number of units to be renewed is large.—Editors.]

The investigation resulted in a reduction in rates for the suburban districts extending from Tacoma to a point approximately twelve miles north, and from Seattle to a point approximately twelve miles south. The following is a syllabus of the opinion rendered by the Commission:

Common Carriers—Amount of Return.—Provided a public service corporation charges no more than each particular service is worth to its patrons, it is entitled to receive from rates and fares a fair return on the value of its property used in the public service.

Carriers—Return, How Estimated.—Generally a reasonable return for a public service corporation is such as is expected and generally realized in the locality upon investments for a somewhat similar nature with regard to the risk attending them.

Carriers—Interurban Road—Return, Entitled to.—Where an interurban railroad connects two large growing cities but 31 miles distant, traversing rich and fertile valleys with numerous towns, the future population of which valleys it is conceded will be dense, where the surroundings are ideal for an interurban road and where little or no risk is involved in the enterprise, a lower rate of return would be expected than if the undertaking was hazardous or involved risk. Held, under the facts in this case, 6 per cent return on the then value of the property is sufficiently remunerative.

Discounts—Expenses of Financing Bonds—Well-Secured Bonds.—The expense necessary to be paid a reputable broker for making a full and complete investigation into the cost and prospects of an inviting public service enterprise and a reasonable compensation for inducing his clientage to invest in well-secured bonds and securities of such corporation is a legitimate and proper item of expense. Well-secured bonds are such as have behind them the guarantee of a solvent independent road or where a substantial amount of the investment is procured independent of the mortgage bonds. Where all the investment, including costs of organization and preliminary surveys, are derived from the sale of bonds, the loan is not a financial business transaction, but is a financial speculation. Discount paid under such circumstances is not a proper item to be considered in valuing the property. Held, under the facts in this case, that 5 per cent of 75 per cent of the cost of reproducing the road is a proper and ample sum to cover the costs of financing the enterprise.

Capital to Remain Unimpaired—Depreciation—Obsolescence.—A public service corporation is clearly entitled from its operating revenues to not only earn a reasonable return on the value of its property so used, but to maintain unimpaired its capital. While during the first few years of the life of the railroad there is practically no call for renewals, the property is nevertheless daily growing older, and the traffic then being moved should bear its portion of the burden dependent upon depreciation and obsolescence and not throw this full burden upon the traffic moving when heavy renewals become necessary. In such cases there should be charged to operation a sum sufficient to care for such renewals and obsolescence as they become necessary and a fund should be maintained for such purpose. Traffic of today should pay enough to secure a fair return on the property and maintain unimpaired the capital, but cannot be called upon to bear burdens that should have been borne by traffic in the past.

Particular Rate—When Reasonable.—In no event can a carrier charge more than the particular service is worth to the shipper. The value of the service is to be considered and not exceeded, subject to the qualification that the charge must at least equal the moving cost. Where mechanics, laborers and clerks have been induced by a long continuous rate to settle in suburban towns and where approximately all of the heads of families in such towns are such laborers and clerks dependent for their livlihood on employment in the cities, an advance in the rates to such an amount that such persons cannot live and pay the rates, but must abandon their homes for localities where cheaper transportation prevails, is unreasonable, irrespective of the return received by the company, excepting that the company cannot be called upon to render the service at a loss.

Schedule or Rate—When Reasonable.—Many features must be considered in determining whether a rate is or is not reasonable. The whole schedule must be considered when judging its fairness to the company, and if from all its revenues it receives but a fair return and the patron is charged no more in each particular case than the service is worth, per se the rates cannot be said to be unreasonable.

Comparison of Rates.—A comparison of the rates charged generally for a specific service by other roads under normal conditions, together with a comparison of the relation of such rates both to the carrier and the shipper, furnishes a good test to judge of the reasonableness of such particular rate. Held, that as the rates generally charged by electric lines to points not suburban are at least two cents per mile and such rates are generally deemed reasonable, and the carrier in this case not receiving under the rates so advanced a sufficient return, no reason exists why the rate to points not suburban and between intermediate stations should be reduced below two cents per mile. As residents of Seattle and Tacoma have the advantage of water competition at exceedingly low rates, no peculiar circumstances exist calling for a reduction of the through rate.

Discrimination — Suburban Rates—Commutation Rates.—The fact that an occasional traveler from points not suburban might be compelled to pay a greater rate per passenger mile than the constant traveler from suburban points does not subject him to unjust discrimination. He is entitled to be carried at a reasonable rate, but not necessarily as cheaply as the residents of the more favored districts. The public is interested in the building of suburban towns, thus aiding the territorial growth of cities, relieving their congested districts.

Spring Meeting of the American Society of Mechanical Engineers.

The spring meeting of the American Society of Mechanical Engineers will be held in Atlantic City, N. J., May 31-June 3. This is the regular semi-annual meeting of the society. The local committee, chosen from the vicinity of Philadelphia, under the chairmanship of James M. Dodge, past president, is making provision for the entertainment. The headquarters of the meeting will be the Marlborough-Blenheim. The registration office will be located in the hotel, on the board walk floor, and the professional sessions will be held in the solarium on the office floor. The following is the program:

Papers on Machine Construction and Operation.—"The Shockless Jarring Machine," by Wilfred Lewis; "A Comparison of Lathe Headstock Characteristics," by Prof. Walter Rautenstrauch; "The Strength of Punch and Riveter Frames Made of Cast Iron," by Prof. A. L. Jenkins; "Improved Methods in Finishing Stay Bolts and Straight and Taper Bolts as Used in Locomotives," by C. K. Lassiter.

Gas Power Section.—Business meeting and reports of committees. Papers: "A Regenerator Cycle for Gas Engines using Sub-Adiabatic Expansion," by Prof. A. J. Frith; "Gas Engines for Driving Alternating-Current Generators," by H. G. Reist; "Two Proposed Units of Power," by Prof. Wm. T. Magruder; "Some Operating Experiences with a Blast Furnace Gas Power Plant," by H. J. Freyn.

Miscellaneous Papers.—"The Mechanical Engineer and the Textile Industry," by H. L. Gantt; "The Elastic Limit of Manganese and other Bronzes," by J. A. Capp; "The Hydrostatic Chord," by R. D. Johnson; "The Resistance of Freight Trains," by Prof. Edw. C. Schmidt.

Papers on Power Transmission.—"Improvements in Lineshaft Hangers and Bearings," by Henry Hess; "Experimental Analysis of a Friction Clutch Coupling," by Prof. Wm. T. Magruder; "An Improved Absorption Dynamometer," by Prof. C. M. Garland; "Critical Speed Calculation," by S. H. Weaver.

Summer Courses for Engineers and Artisans at the University of Wisconsin.—The tenth annual session of the Summer Schools for Engineers and Artisans, under direction of the College of Engineering of the University of Wisconsin opens June 27, continuing for six weeks. Advanced courses are offered in direct and alternating currents, hydraulics, machine design, descriptive geometry, applied mechanics, shopwork, steam and gas engineering and surveying. Elementary courses for artisans, and those not having preparation for the advanced work, are offered in applied electricity, engines and boilers, fuels and lubricants, mechanical drawing, machine design, materials of construction, shopwork and surveying. The teaching staff is taken from the regular instructional force, and all laboratory equipment of the engineering college is available for students. For bulletin or further information address F. E. Turneaure, Dean, College of Engineering, Madison, Wis.

Surveys have been completed for the construction of the proposed connecting link between the Tonopah & Tidewater and the Western Pacific and bonds for the construction of the line are being negotiated in the East. As projected the line will be from Goldfield, Nev., to Ely, and will necessitate an expenditure of $5,000,000. The link will pass through the mining districts of Golden Arrow, Silver Bow, Horseshoe, Rattlesnake, Clifford Belle Hellen, Tybo and Reveille, and will tap an extensive farming country, especially in Ho Creek valley and Railroad valley.

W. P. Richardson & Co., Jacksonville, Fla., has been awarded the contract for the construction of terminals for the Clyde Line at that place. The work, it is estimated, will cost $500,000 and includes the construction of three piers.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

First Cost and Cost of Operating Power Plants for Driving North River Tunnels of Pennsylvania Railroad, New York City.*

Two power plants were constructed, one on each side of the river. The plants contained in the two power-houses were almost identical, there being only slight differences in the details of arrangement due to local conditions. A list of the main items of the plant at one power-house is shown in Table I. A summary of the first cost of one plant is given in Table II.

In order to give an idea of the general cost of running these plants, Tables III and IV are given as typical of the force employed and the general supplies needed for a 24-hour run of one plant. Table III gives a typical run during the period of driving the shields, and Table IV is typical of the period of concrete construction. In the latter case the tunnels were under normal air pressure. Before the junction of the shields, both plants were running continuously; after the junction, but while the tunnels were still under compressed air, only one power-house plant was operated.

TABLE I.—PLANT AT ONE POWER-HOUSE.

Description of Item.	Cost.
3 500-hp water-tube Sterling boilers	$15,186
2 feed pumps, George F. Blake Manufacturing Company	749
1 Henry R. Worthington surface condenser	6,539
2 electrically-driven circulating pumps on river front	5,961
3 low-pressure compressors, Ingersoll-Sergeant Drill Company	33,780
1 high-pressure compressor, Ingersoll-Sergeant Drill Company	6,665
3 hydraulic power pumps, George F. Blake Manufacturing Company	3,075
2 general electric company's generators coupled to Ball and Wood engines	7,626
Total cost of main items of plant	$79,572

TABLE II.—SUMMARY OF COST OF ONE PLANT.

Total cost of main items of plant	$ 79,572
Cost of four shields (including installation, demolition, large additions and renewals, piping, pumps, etc.	103,560
Cost of piping, connections, drills, derricks, installation of offices and all miscellaneous plant	101,818
Cost of installation, including preparation of site	39,534
Total prime cost of one power-house plant	$324,484

TABLE III.—COST OF OPERATING ONE POWER-HOUSE FOR 24 HOURS DURING EXCAVATION AND METAL LINING.

Labor.	Rate per day.	Amount.
6 Engineers	$3.00	$ 18.00
6 Firemen	2.50	15.00
2 Oilers	2.00	4.00
2 Laborers	2.00	4.00
4 Pumpmen	2.75	11.00
2 Electricians	3.50	7.00
1 Helper	3.00	3.00
Total per day		$ 62.00
Total for 30 days		$1,860.00
Supplies:		
Coal (14 tons per day)	$3.25	$ 45.50
Water	7.00	7.00
Oil (4 gal. per day)	0.50	2.00
Waste (4 lb. per day)	0.07	0.28
Other supplies	1.00	1.00
Total per day		$ 55.78
Total for 30 days		1,673.00
Total cost of labor and supplies for 30 days		3,533.00

TABLE IV.—COST OF OPERATING THE ONE PLANT FOR 24 HOURS DURING CONCRETE LINING.

Labor	Rate per day.	Amount.
2 Engineers	$3.00	$ 6.00
2 Firemen	2.50	5.00
2 Pumpmen	3.00	6.00
1 Foreman electrician	6.00	6.00
1 Electrician	3.00	3.00
1 Laborer	2.00	2.00
Total per day		$ 28.00
Total for 30 days		$840.00
Supplies:		
Coal (14 tons per day)	$3.15	$ 44.10
Oil (4 gal. per day)	0.50	2.00
Water	13.00	13.00
Other supplies	2.00	2.00
Total per day		$ 61.10
Total for 30 days		1,833.00
Total cost of labor and supplies for 30 days		2,673.00

Depreciation and Reserve Funds of Electrical Properities.*

Every company operating an electric light and power property, a street railway property, or a telephone property, or contemplating entering into any such field of activity, must take into account certain expenses that cannot be appropriately included in the day by day operating and office costs or in the current maintenance expenses of the property, if its accounts are to show in full the actual cost of performing the services required.

I refer to the sums of money that must be set aside to cover depreciation replacements and to provide a reserve fund to care for extraordinary costs as hereafter explained.

The term *depreciation* as here used may be divided into two parts:

1. Decrepitude—Which covers the gradual wearing out of the apparatus from the effects of use and of age, which cannot be overcome by current repairs, and which results eventually in ending the operative life of the apparatus.

2. Obsolescence—Which takes into account the reduction in the useful life of apparatus, on account of advances in the art whereby otherwise operative apparatus is made uneconomical for further use.

The term *reserve fund*, as here used, may also be divided into two parts:

1. Required Reconstruction—Which takes into account reconstruction costs made necessary by municipal or other legislative requirements.

2. Special Insurance—To cover expenses that cannot be forecast with any degree of certainty, caused by extraordinary occurrences such as unusual storms, explosions, great conflagrations, acts of strikers, etc.

In considering *depreciation* it is well to clearly separate in one's mind the annual depreciation of the plant as an average whole and that of the component parts making up the plant. To obtain the true amount of the annual depreciation in the value of any property, it is necessary to estimate a sum of money which represents the yearly depreciation of each of the component parts of the plant, and the aggregate of these sums of money for all parts of the installation gives the annual depreciation for the plant. This may be converted into a percentage on the total value of the installation which is subject to depreciation. Any method of arriving at the amount of annual depreciation that does not take into account the individual depreciations of the component parts of a plant, must be an approximation at best, even though it may be based upon results obtained in a correct manner for other similar plants, and it may be very far from accurate.

This division of a plant into its component parts for purposes of determining its annual depreciation is usually a simple matter. It requires that each of the component parts shall be such that when it has reached the end of its useful life the part in its entirety will be discarded, and that it shall be possible to intelligently determine its probable salvage value as a whole. If these requirements are not fulfilled the part should be divided until they are.

If we consider the overhead distribution lines of an alternating current electric light plant, the lines may be divided into the following parts: bare wire, weatherproof wire, rubber covered wire, transformers, lightning arresters, insulators, and poles and cross arms with their hardware; and in some cases there may be further divisions. The poles and cross arms with their hardware can usually be considered together as one part, as cross arms and hardware generally outlast the poles but seldom are used again when their corresponding poles are discarded, so that a pole and its fittings may be considered as having useful lives of equal length. It will be seen how impossible it would be to determine a fair amount for the depreciation of poles and wires without thus analyzing the aggregate, owing to the widely differing useful lives of the two kinds of plants and the great difference in the proportions of their salvage values. Or again, consider electric railway track; there are the ties with short life and no salvage; there are the rails with medium life and good salvage; there are the frogs and switches with short life and low salvage, and there is the electrical bonding which may be considered as having the same life as the rails and to have medium salvage. It would be impossible to determine a fair annual depreciation for track considering all of these parts together, but it is possible to obtain the fair average depreciation by taking the aggregate of the amounts found by considering the several parts individually.

The total amount of depreciation to be annually charged against any part of the installation should be equal to the first cost of the part installed ready for service plus the cost of removal, less any salvage obtainable for the part when discarded, divided by the years of probable life of the part.

The estimation of what is the fair useful life for any part of a plant presupposes a thorough knowledge of the nature of the service demanded of the part, a broad acquaintance with the general experience respecting like kinds of plant, a studied survey of the probable effect of local conditions upon the useful life, and a keen knowledge of the past and present progress of the art for the purpose of making an intelligent forecast of the rate of depreciation caused by approaching obsolescence. A fair determination of the useful life is thus based upon several independent variables, and the result must be reached by judgment after duly applying what seems to be due weight to each of the factors involved.

In estimating the fair salvage value to be assigned to any part of an installation, it is often possible to fix it by some relation to the actual junk value of the materials comprising the part. For instance, the salvage value of a lead-covered paper insulated cable that has finished its useful life will be substantially the residue of the junk value of the lead melted off, and of the copper with the paper burned off after the cost of withdrawing the cable from its place of service and preparing the junk has been deducted, though sometimes cable rejected for use in one kind of service may be used in another, in which case its value when discarded from its original use may be the value of cable that would ordinarily be used in the second service, assuming good engineering judgment in the construction and operation of the property. The matter is not so simple with buildings and machinery. With the former it will frequently be found that the cost of removal will equal the junk value, and the salvage value is therefore zero; while with the latter the price that can probably be obtained from a second-hand dealer for the machinery in place may sometimes be considered as the salvage value, and in other cases the salvage value is the price that can be obtained from an old metal or junk dealer for the machinery in place.

The factor of obsolescence entering into the question of useful life of plant, whether

*A paper by Mr. B. Jackson presented to the Western Society of Engineers, April 27, 1910.

of buildings, machinery, or other plant, is a disturbing one. This has the effect of reducing the estimated useful life of many parts of most plants below that which would be indicated by the ravages of decrepitude, and it likewise affects the probable salvage. Where the factor of obsolescence is estimated as likely to terminate the useful life of a part before decrepitude would be likely to cause its rejection, the former factor must determine the useful life. Consequently, the factor of obsolescence may be the determining factor in fixing the length of the useful life of some parts of a plant, and decrepitude may be the determining factor in fixing the length of useful life of other parts. In other cases these two factors may jointly influence the length of life. The factor of obsolescence has been an exceedingly important one in the several kinds of properties under consideration, and especially so in connection with all kinds of switchboards and other controlling apparatus. But its effect is very apparent, even when considering what we think of as the most stable parts of an electric generating plant, though revolutionary effects are not so apparent today as they have been in the past. Let us consider a large high grade engine-generator set for alternating currents. Few of us would be willing to place at less than fifty years the period during which such a machine should be physically capable of doing, under good care and management, the particular work for which it was designed; but no conservative engineer would allow, when estimating depreciation, that such a machine will have, in ordinary commercial electric service, a useful life of fifty years, because advances of the art would inevitably affect its usefulness. In consideration of the great changes that have taken place in the past in apparatus for the generation and distribution of electric power, and the probable changes that will take place in the future, such a piece of apparatus cannot appropriately be allowed an estimated useful life of over twenty to thirty years. Local conditions also may influence to a considerable degree the length of the useful life that may be allowed.

Most public service companies are forced to make large expenditures by ordinances of municipalities or by other legislative action. These are required changes, such as changes from overhead construction to underground construction, relocation of distribution lines on account of new street surveys, changes from wooden poles to iron or steel poles, changes in track construction owing to paving of streets, etc. The costs of such changes up to the value of the original construction should not be made an addition on capital investment and they cannot appropriately be considered as a part of current maintenance, but they should be provided for by a *required reconstruction* fund. An adequate estimate of a suitable yearly contribution, on account of required reconstruction, can only be accomplished after a careful study of what expenditures have been made in the past on account of required changes in the plant under consideration, accompanied by a study of the district served by the plant with the view of forming a judgment of what requirements are likely to be imposed in the future. In the case of changes from overhead to underground line construction that are likely to be required, it is sometimes possible to make quite definite estimates of the cost of such changes for many years to come by a study of the character and probable rate of development of the territory covered by the company's lines, from which an estimate can be made as to what will normally become underground territory year by year. And in some cases a regular schedule of such changes is determined by city ordinances.

The question of what annual charge should be made on account of *special insurance* is also difficult to solve with exactness, but it is one of which sight should not be lost. The ordinary maintenance expenses should not be expected to include such costs as those occasioned by the destruction of a power house roof by a wind storm, the annihilation of a boiler-room by a boiler explosion, the razing of a pole line by sleet and storm, etc. It is, therefore, appropriate that an annual amount be laid aside for each part of the plant, except, of course, land, to create a fund to remedy such damages which come once in a while to every plant. The element of chance must enter very largely here, but chance is not such a fickle factor in operations when its effects are distributed amongst many parts of a plant.

These factors of *required reconstruction* and of *special insurance,* which I have considered under the heading *reserve fund,* are quite different in their characteristics from depreciation, but a plant will just as surely get into the breakers if its reserve fund, or some equivalent to meet these expenses, is not kept in good shape as when no provision is made to take care of depreciation.

If replacements are taken care of by capital account, a property becomes burdened by an imaginary capital investment in physical property which is almost sure to be a serious handicap when the company desires to reduce rates or make improvements. Where replacements are permitted to be taken care of by capital account, the capital account becomes something like the wallpaper in a room (to use a homely comparison) which has been put on layer upon layer, the old not having been removed when the room is newly papered. The papering is not worth more than the last effective layer, and in fact the lower layers sometimes prove the destruction of the whole, and so it may be with an inflated capital account.

By capitalizing replacement costs, the burden of carrying these costs is thrown upon the future without limit of time in cases of unlimited franchises, when this burden should have been borne by the past, except during the period in which a company is still in process of building up its business to a remunerative one.

Most plant managers have not yet come to a full appreciation of the dire straits a plant must come to sooner or later if the depreciation appropriations or their equivalent are not systematically and intelligently attended to. We may consider, for example, a property having a large investment in pole lines. This may amount to as much as 10 per cent of the value of the plant. For the first ten years comparatively few replacements of poles will be required, but during the next two years most of the poles may have to be replaced. Thus an average amount of money equal to almost 5 per cent of the plant investment may need to be expended each of these years for pole replacements alone, and other parts of the plant are surely and irrevocably coming to the same condition. Thus, if there has not been due regard given to a depreciation fund, or the plant is not extraordinarily prosperous, great difficulty will be encountered in obtaining the necessary money for replacements when their need begins to be acutely felt.

A third division is sometimes made in depreciation, called *inadequacy.* This factor covers costs which are occasioned by the necessity of discarding otherwise serviceable plants on account of growth of business. For example, if an electric plant is operating with three small dynamos, and it is found necessary to increase its capacity, it may be best to displace one small dynamo by a larger one, even though the small dynamo may be far short of having operated during its entire useful life, estimated from the standpoint of depreciation. The fund accumulated on account of depreciation for this dynamo, plus the salvage, would likely not cover the loss occasioned by discarding the apparatus at that time. This difference might be made up by a contribution to the depreciation fund on account of inadequacy. This factor should be of small importance in a plant planned and operated with excellent engineering judgment, and it is so closely allied to obsolescence that it does not seem necessary to add a third division to depreciation. It may be properly considered as a part of obsolescence wherever it enters as an appreciable factor in any consideration of depreciation.

The expenses that are considered in the foregoing pages are as real as the pay-roll and other daily operating expenses of a plant, but the ravages of depreciation frequently do not show to a noticeable degree until several years after the beginning of the operation of a plant, and there are also likely to be long periods during which it is unnecessary to make much, if any, outlay on account of required reconstruction and special insurance. For these reasons there is serious danger of overlooking the importance of these expenses in promoting a new enterprise, or in the early days of the operation of a public service company. But if the earnings of a company, after it has become well settled in its business, are not sufficient to cover a fair appropriation annually to the depreciation and reserve funds, as well as to cover the regular operating expenses and a reasonable return on the investment, that company is one that conservative investors should shun. If the conservatively estimated earnings of a new project do not show that they will provide such returns, it should not be considered an attractive project.

Having considered the general question of depreciation and reserve funds, let us now consider how the principles involved should be applied.

Few kinds of apparatus depreciate in value by equal yearly increments, but nevertheless the final effect of decrepitude or obsolescence is to eventually wipe out of the true assets of the company the value of the part less the amount saved by salvage. Such being the case, it will be readily seen that as a piece of apparatus having a useful life of n years, for example, will be in service just n years, each year of service will reduce its serviceableness to the owner one nth part. Its depreciation should, therefore, be based upon equal yearly increments of one nth, in determining the annual contribution that should be made toward the depreciation fund.

Therefore an annual contribution to the depreciation fund should be made such that in n years it will accumulate an amount equal to the first cost of the part installed ready for service minus the net salvage, net salvage being defined as the junk value less the cost of removing the part and preparing it for sale, that is, as the net sum recovered. But the annual contributions should draw interest at the usual trust rate for the state in which the plant is located, and the annual contribution to the depreciation account is, therefore, less than one nth of the first cost of the part. Thus, if the trust rate is 4 per cent and n is 10 years, the actual percentage of the cost that need be set aside annually would be 8.33 per cent of the first value of the part minus estimated net salvage. In this way the annual contribution to the depreciation fund for each part, or group of parts having the same useful life, may be determined, taking into due account the differences in life and salvage of different parts, and the sum of these several amounts gives the annual contribution to the depreciation fund for the entire plant. With this amount known, the proportion which the annual contribution to the depreciation fund has to the total cost of the plant subject to depreciation is at once available, and the percentage of annual depreciation is known.

This statement may be qualified to a certain extent by the fact that every plant will take some time to obtain a paying business, and that during this period of upbuilding it is not expected that the earnings should cover a depreciation fund. Such being the case the annual appropriation to the depreciation fund would be omitted during this period (which should not be long) and correspondingly increased for the later years of operation.

In case of reconstruction and special insurance, the average amount of expenditure that is likely to occur must be determined as closely as possible in the manner already described, but here no trust interest can be considered, for, while at times the fund may show an accumulation, at other times it may be negative, so that interest received at times of accumulation may be considered as offsetting interest paid during times of borrowing.

The accumulation of these funds is for

specific purposes and the money should be used only for those purposes. Also, those purposes should be supported solely from these funds. Thus, when property must be replaced on account of its depreciation, the cost of doing this (less salvage on the discarded plant) should be defrayed out of the depreciation fund, and when an underground line must be substituted for a useful overhead pole line, on account of municipal legislation, only the difference between the first costs of the underground and overhead lines should become a capital charge, and the remainder of the expenditure (less salvage) should come from the accumulated funds. It is obvious that the depreciation fund will accumulate in the earlier years after a plant has been established, because the replacements during the earlier years will be few; but after a plant is fifteen or twenty years old, the expenditures for replacements and the contributions to the funds will somewhat nearly balance when averaged over several year intervals. In all but the very largest and most comprehensive plants, the expenditures for replacements and required reconstruction will vary greatly from year to year, but the amount contributed to the fund each year should follow the computed average figure; and the sum maintained in the funds may therefore vary.

Sometimes depreciation funds are put into new plant instead of into accumulated funds. There is some question as to the advisability of this. Unless the books of a company are kept with extraordinary care, or the plant represented by the depreciation fund is kept distinct from the remainder, it is difficult to keep track of what plant represents capital investment and what represents depreciation. This difficulty is magnified, as the plant representing depreciation itself depreciates, thus introducing an additional factor that must be taken care of in the bookkeeping, and eventually the concern is likely to lose the enviable situation of having its books show the actual facts regarding its property.

It may be said that an old plant worked down to its ultimate operating condition will have an annual expenditure for replacements which remains approximately uniform, so why permit the depreciation fund to lie as a trust fund when it might be actively used in additional plant? If the depreciation fund is put into plant, the company is likely to lose its ability to show the relation of its physical property to its capital investment, and it cannot then show a true relation between earnings and the physical value of its plant. The fact cannot be ignored that the people of this country today expect public service companies to be in a position to show that their service is satisfactory and supplied at a reasonable cost, and it, therefore, seems necessary that such companies should be able to know their actual investment in property which represents capital invested.

The coming of public service commissions, having power to regulate the rates of public service companies, has raised the question whether the depreciation of a plant should have an influence upon the earning power of the company. It seems patent that a company should be permitted to earn a fair return on a full, reasonable, unimpaired capitalization regardless of depreciation, so long as it supplies equally good service. This question would not seem to me to be open to doubt were it not sometimes a subject of serious discussion, and were it not that some respected publicists seem to hold that the net earning power of a public service company should be less after its plant has been subject to depreciation than when brand new, even if it gives equally good service and the stockholders have received back no part of their invested principal, but only fair returns in interest.

With a properly conducted property the fact that the property has suffered depreciation, which is unavoidable in any electric plant, should not have the effect of injuring the quality of its service or of impairing its capital, which would be the case if its recognized earning capacity were expected to decline proportionally with the increase of its depreciation fund.

If a fair figure has been estimated for the annual contribution to the depreciation fund, this fund will always carry sufficient money to make replacements when required, and as the income from the depreciation fund is used to help build the fund, the owners of the property will not receive returns on their money twice. The investment in the property does not diminish as the plant depreciates, and I do not understand that any one claims that an amount equal to the depreciation may appropriately be distributed to the security holders of the company and thereby reduce the capital outlay in physical property. If the security holders are permitted to receive interest and dividends based upon a fair return on the investment in their property during the first years of its operation, I am unable to see how this basis may be fairly changed during later years, so far as investment is concerned, after the plant has depreciated, as the investment has remained unchanged.

There is another phase of depreciation I would like to touch upon before closing.

The tendency of today is to make sweeping changes in plant and methods, to permit of less expensive or of improved service. On this account many excellent plants in good operating condition are shut down and the requisite power received from other sources. A company cannot well charge off of its capital account the value of such plants which may be comparatively new when they are put out of commission. In fact I have in mind a plant of 1,000 kw. capacity, which is of modern design with steam turbine-generators not over two years old, which with several other plants is being shut down, owing to the possibility of obtaining power from another source at less cost than it can be produced in these plants. The question is, what should be done regarding the capital value of such plants? Unless it is necessary to retain the plants in reserve, I believe they should be dismantled and the capital of the company reduced by the amount received from the sale of discarded machinery and other property. Then the difference between the amount received from their sale and their actual capital value to the company may still be continued as a true asset of the company, and that value be gradually charged off at the normal depreciation rate of the plants discarded, the capital of the company being reduced each year by actual liquidation of that amount. In other words, the situation is one wherein the regular depreciation appropriation is made on account of the property until the full cost of the discarded property is returned to the security holders. After this no further appropriation should be made on account of depreciation of the property concerned, as no replacements would have been made on the property, and consequently it would have been depreciated out of existence. The economies derivable from abandoning the discarded machinery should be sufficient to extinguish in this way the capital value of the abandoned plants, or else the transaction is not an advisable one.

In conclusion I will say that, where electrical properties have been failures in the past, a goodly proportion of the failures may be traced to lack of provision for depreciation expenses and for extraordinary expenses. The reserve fund, besides covering such extraordinary expenses as are mentioned in the foregoing discussion, must be sufficient to care for losses occasioned by any recession of income which may come in the train of the physical results of the extraordinary occurrences discussed. The proper organization of a depreciation fund in conjunction with the reserve fund will also fortify a company against difficulties on account of reduced net earnings during lean years, which every company must expect, and which lean years will be offset by good years.

All of you will appreciate that it is impossible to figure the expenses considered in the foregoing to a high degree of exactness, but they may be figured logically and intelligently, and it may be said that a company which follows the principles here laid down regarding depreciation and reserve funds is likely to travel along an untroubled path so long as its field of operations provides sufficient earnings to warrant the company's existence.

The Opportunities for Engineering Employment in South America.

Sirs: Will you kindly send me whatever information you can regarding Engineering in South America; Esperanza, Sonora, Mexico.

April 6, 1910. F. S.

(Our best answer to your letter appears in the issue of April 27 in the form of an article on construction work in Peru. Our advice to any engineer seeking work in South America is to secure his position before going there, as the best positions are all secured in that way. While in Peru, the writer met several engineers and others who had made the mistake of going there in search of a position, and almost invariably had been compelled to begin work under poor circumstances. Changes in the staff of companies are frequent, however, and good men are in demand. A better contract can always be made before going. All malarial districts, of course, are to be avoided, especially by foreigners not used to tropical climates. Too many men of strong physique and excellent health have considered themselves immune to change of climate and conditions only to become inoculated with the malaria. A knowledge of Spanish is useful and at times is essential, but in general it may be acquired after going there. All along the western coast and in Colombia much mining work is being done and this industry employs most of the engineers on this coast. Much municipal work is also going on, and the several railroads which cross the Andes employ foreign engineers almost exclusively. On the east coast much more agriculture is carried on and industries vary from those west of the mountains accordingly. As to the further information which is sought, we would advise our correspondent to correspond with W. R. Grace & Co., New York City. This company operates a line of ships all around South America and is heavily invested in nearly every South American country. The Bureau of American Republics, Washington, D. C., is also in a position to furnish valuable information.—Editors).

"A Point of View"—Suggestions Regarding Modern Organization from a Story in McClure's Magazine May, 1910.

Sirs: The following is not a literal quotation, being transformed into terms of industrial organization rather than the military organization of the magazine article.

"Those who are responsible for a modern organization, whether it be industrial or military, should be aware that this organization is an instrument to be played upon and not, as it has often been miscalled, a machine which works with regularity; it is an instrument in which, from top to bottom, allowance has continually to be made for the weakness of human nature and therefore has very little resemblance to a machine. Consequently the material and psycological aspects of the art of production and the action and the reaction of the one upon the other must be fully recognized. From the humblest employee to the chief, for every human being liable to stress, every effort must be made to mitigate the results of such stress.

This principle must be carried out consistently through the entire organization, but it reaches its highest development in reference to the chief. In value he does not represent an individual or any group of individuals. He represents the underlying principle—who can estimate his value? If he is the right man in the right place, his brain, his character and his influence are the greatest assets of the organization. It must be recognized as essential that the chief be in the best physical condition and it is no part of the scheme that he should share in any of the hardships of the organiza-

tion or in any other hardships whatever. Even at the risk of the sneers of the thoughtless and the ignorant—even against his own natural tendencies—he must be preserved from every avoidable danger and discomfort, whether mental or physical, which might impair his health and so affect his judgment.

It must be recognized that the day when any one man can by personal observation keep in his grasp the progress of all and every entire operation, is gone. Modern operations cover many details and much distance and no one man can hope to obtain by visual observation more than a small portion of the information that is necessary in the conduct of large affairs. If he is at the front he is dependent for any comprehensive view of events upon intelligence conveyed to him from other divisions of the organization. Indeed, the closer he is at the front the less he would see, although what did come within his view might be very clear—probably far too clear. In such conditions he would be liable to be influenced unduly by the proximity to minor events and details of which he should happen to be the eye witness, influenced perhaps to the detriment of the main issue.

Indeed, there are many recorded cases where the chief of an organization who should have been thinking in large units, has allowed his judgment to be warped by a near view, which only embraced the small details actually witnessed. It is better, therefore, that a well trained chief should receive his information and be placed in a position where he can reduce it to a common denominator, uninfluenced by personal knowledge of any separate portion. It is a question of mental optics—for the larger picture, the longer focus is required. Retirement from the front does not mean isolation from information which information can usually be better acted upon if received in an undisturbed place.

Again, the actual presence of a chief upon the ground has not the moral value that it had before time, where he dealt individually with his employees, for today his presence can be known only to a few. What is required by an organization today is victories organized by the chief and the men will worship him if he secures these victories to them, whether they see him personally or not. There is, however, one objection to this theory of the detachment of the thinking brain from the actual detail of the organization, and that is, when this brain is linked to a highly strung temperament, it may be and probably is, more disturbed by the pictures evoked by the imagination than anything that could actually be seen.

The problem that the chief must solve is purely a human one and in order to solve this problem efficiently he must be a humanitarian in the broadest sense of the word. The physical and technical problems which he must meet and overcome he can study in advance and he should so protect himself by a close study of his subject that when the time for action arrives, the human problem will be the only one which can confront him, for it must be realized that although he does not fight great actions every day, he must be fully prepared to fight any great action at any time.

The mind, therefore, of the chief is under a continuous strain. Indeed, to keep away from the front in times of stress is in itself a great strain. It needs far more moral courage to remain in the rear than to lead an action under influence of enthusiastic emotion. Therefore a chief must realize that a very large part of his duties lies in keeping himself fit and calm and loyally trying to keep his mind detached ready for big questions, even though this is at great effort to himself. Everything must be arranged as far in advance as possible and the time for the action of the chief should not come except when the enthusiasm of the organization begins to flag or an added incentive to a necessary, immediate action is required. Therefore, a fussy chief who interferes in details and districts the attention of his subordinates from the main issue will not usually be able to keep the instrument upon which he plays to its highest pitch of effectiveness."

Personals.

Mr. A. O. Wheeler, head of the Topographical Survey of the Canadian Government, has resigned his position.

Mr. J. Antonisen, City Engineer of Port Arthur, Ont., has been appointed manager of the Public Utilities of that city. He will have control of the water-works, telephone, electric light, electric power and trolley lines.

Samuel E. Weber, a civil engineer superintending the construction of a state road between Orangeburg and Sparkhill in Rockland County, New York, was instantly killed May 21 at Nyack, N. Y., in a collision between his automobile and a passenger train.

Consider B. Carter, a contractor who had done much work in Chicago and vicinity, died May 23 at White Plains, N. Y. He built the bridewell, the Chamber of Commerce buildings before and after the fire at Chicago, Ill., and a section of the Illinois and Michigan canal. He was born in New York seventy-seven years ago and with his brothers organized the contracting firm of Carter Bros. in Chicago in 1855.

Mr. Henry S. Jacoby, Professor of Bridge Engineering in the College of Civil Engineering of Cornell University, has been granted a sabbatic leave of absence for the first half of the next academic year. He expects to leave home on July 1, and to devote the following seven months to travel in the United States and Canada; to visit the bridge departments of various railroads and municipalities, and to inspect some important bridges and other structures.

Capt. J. R. Ellinwood, an early railway engineer, died recently at Ringwood, Okla. Capt. Ellinwood is said to have made the original survey of the Santa Fe R. R. from Atchison, Kan., to Santa Fe, N. M. He established many of the towns along that line, the town of Ellinwood, Kan., being named for him. He also surveyed the Santa Fe line south through Wichita, which town he surveyed and located, and was later connected with the engineering departments of the Rock Island and Frisco roads.

Prof. Alexander S. Langsdorf has been appointed Dean of the Engineering School at Washington University, St. Louis, Mo., succeeding Mr. Calvin S. Woodward. Prof. Langsdorf was graduated from Washington University in 1898 with the degree of B. S. and received the M. M. E. degree from Cornell in 1901. From 1901 to 1904 he was Assistant Professor of Electrical Engineering at Washington University, and in 1904 was elected to full professorship. He will continue to be professor of electrical engineering as well as dean of the Engineering School.

Mr. Frederick Maynard Mann, for the past eight years Professor of Architecture at Washington University, has been appointed Professor of Architecture in charge of the department at the University of Illinois. Professor Mann prepared for college at the Minneapolis High School and graduated from the University of Minnesota, receiving the degree of Bachelor of Civil Engineering in 1892. After graduating he entered the Massachusetts Institute of Technology, receiving the degree of Bachelor of Science in Architecture in 1894 and Master of Science in Architecture in 1895. He received the degree of Civil Engineer from the University of Minnesota in 1898. He traveled abroad for the study of architecture during the summers of 1896 and 1897. After leaving the Institute Professor Mann was for several years in professional practice with Peabody and Stearns of Boston, with Cope and Stewardson of Philadelphia, and later in independent practice for himself in the latter city. He was Instructor in Architecture at the University of Pennsylvania from 1895 to 1900. Since 1902 he has been Professor of Architecture at Washington University.

Col. Richard Price Morgan, one of the notable early railway engineers of the United States, died on May 19. Colonel Morgan was born in Stockbridge Plains, Mass., Sept. 17, 1828. He emigrated to Illinois at the age of 21 and has been a citizen of that state for 61 years. His death recalls memories of Abraham Lincoln with whom he became acquainted in 1856 and was closely associated from then until the time of Lincoln's death. Colonel Morgan was chairman of the Livingstone County delegation to the state convention in 1860 when Lincoln was first declared the choice of Illinois for the Presidency. The Colonel was connected with the Chicago & Alton R. R. at first as an engineer and at the age of 25 was made superintendent of that road. He designed and perfected the first plans for the double track elevated railway in New York city. Several years ago the University of Illinois conferred upon him the degree of Doctor of Engineering. He resided for 50 years previous to his death in the town of Dwight, Ill., of which town he was the founder. He is survived by two sons, both of whom are prominent engineers, Edward R. Morgan of Bloomington, Ill., and Dwight C. Morgan of Kittanning, Pa. The funeral was held on Sunday, May 22, at Dwight, Ill.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Metal Culvert Time Book.—Paper, 4⅛x6⅝ ins.; 44 pp. The Penn Metal Ceiling & Roofing Co., Ltd., Boston, Mass.

This book devotes several pages to a description of the above named company's product and the balance is made up to use as a weekly time book.

Studebaker High Pressure Street Flusher.—Paper, 9x12 ins.; 4 pp. Studebaker Bros. Mfg. Co., South Bend, Ind.

An illustrated description of a new high pressure water wagon designed to cleanse as well as to sprinkle streets.

Plumbing.—Paper, 4½x6 ins.; 20 pp. The Potteries Selling Co., Trenton, N. J., and Standard Sanitary Mfg. Co.

This is a paper presented by T. T. Cosgrove at the fifth convention of the American Society of Plumbing and Sanitary Engineers and deals with floor connections for water closets and slop sinks.

Asbestos Cement Roofing Slates and Century Shingles. Paper, 5x8 ins.; 76 pp. Keasby & Mattison Co., Ambler, Pa.

This catalog gives illustrations and descriptions of these fireproof roof coverings and it also gives applications and illustrations of the many other uses to which the products of asbestos are put. There are price lists.

"Clipper" Blast Hole Drilling Machine.—Folder, 8x11 ins.; 4 pp. Loomis Machine Co., Tiffin, Ohio.

Gives illustrations showing the use of this machine for quarry work.

Remington Kerosene Oil Engines.—Paper, 5½x7½ ins.; 32 pp. The Remington Oil Engine Co., Stamford, Conn.

This is a well gotten up catalog of the marine and stationary engines built by this company. It contains half tone cuts of the different types of engines and also of parts of engines; also some price lists.

Water Pipe and Casings.—Two booklets, 3½x5½ ins.; 12 pp. each. The Michigan Pipe Co., Bay City, Mich.

Illustrations and descriptions of pressure pipes, mine culm and acid pipes and some facts regarding the construction. Also the casings for prevention of condensation and heat loss in steam pipes.

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

Aside from the several large irrigation and drainage contracts noted elsewhere on this page, the chief feature of the past week has been the number of railroad construction contracts let. Among these may be noted the following: Utah Construction Co., Ogden, Utah, two double tracking contracts for the Denver & Rio Grande Ry. in Colorado, one 10½ miles in length, the other 1¾ miles in length; H. S. Payne, Iron Mountain, Mich., for constructing several short spurs for the Northwestern Ry. in the Stanburgh Iron River district of the Menominee Range, Michigan; the Toronto Construction Co., Toronto, Ont., a $500,000 contract for constructing the Canadian Pacific line from Coldwater to Atherly Junction to give direct communication to Orilla; the Cleveland Construction Co., Citizens' Bldg., Cleveland, O., for constructing 17 miles of double track on the Chicago, Lake Shore & South Bend Ry., from Pullman to Gary, Ind.; Davis & Blair, Joplin, Mo., for grading for the first section of the Laclede, Dallas & Western Ry., which is to build from Phillipsburg, Mo.; Hoose & Person Construction Co., Iron Mountain, Mich., for building three miles of track in the Michigamme district for the Chicago & Northwestern; M. Cassidy, Oklahoma City, Okla., for the construction of the first ten miles of the Denver, Kingfisher & Gulf R. R. from Oklahoma City; the Utopia Construction Co., for the completion of the grade of the Glen Rose & Walnut Springs R. R. into Walnut Springs, Tex.; the Shattuck-Edinger Construction Co., Los Angeles, Cal., for grading the Buckeye R. R. from Buckeye, Ariz.; the L. Clemens Construction Co., North Judson, Ind., for constructing the first 16 miles of the Arkansas & Northwestern R. R. in Arkansas; the Walsh Construction Co., Davenport, Ia., for double tracking the Arkansas division of the Missouri Pacific from Altamont to Bald Knob, Ark.; Jackson & Goldie, Winnipeg, Man., for ditching work along the line of the Canadian Pacific Ry. from Fort William, Ont., to Winnipeg, Man.; and Alfred De Mayo & Co., New York city, for constructing 9.25 miles of track for the Slippery Rock & Grove City Street Ry. Co. from Slippery Rock, Pa.—Events of the past week make it more than likely that the Mackenzie & Mann interests will shortly let contracts for the construction of the Duluth, Winnipeg & Pacific Ry., a 70 mile line into Duluth, Minn., by which the Canadian Northern will establish a through connection with the Chicago & Northwestern Ry. This contract has been hanging fire for some time.—Construction work on the Western Maryland R. R. extension from Cumberland, Md., to Connellsville, Pa., will soon be under way. The Carter Construction Co. of Chicago, Ill., which has the general contract, according to press reports, on May 20 awarded ten sub-contracts on the work. The first 20 miles of the line will be built by the Carter Co. and the rest, as noted above, will be sublet.—The Sinking Fund Commission of New York city has approved the plan for the improvement of the west end of Jamaica Bay, which includes dredging a channel and the construction of docks that will be owned by the city for trans-Atlantic vessels.

The New York State 8-Hour Law Again.

Two cases of more than ordinary interest regarding the working of the New York State 8-hour labor law are cited in the recently issued report of the State Commissioner of Labor. A brief summary of these cases and the comments of the Commissioner on them follow. The first case occurred in Albany where a sub-contractor was engaged in laying actinolite roofing on the state armory. Investigation of a complaint established the fact that the laborers and mechanics were required or permitted to work more than eight hours a day. A notice directing attention to the violation was duly served upon the State Board of Armory Commissioners. The board immediately took cognizance of the matter and ordered an inquiry. The inquiry developed the fact that the general contractor had warned the sub-contractor involved to observe faithfully the requirements of the law and his contract in respect of the hours of labor of workmen. It also established beyond any question that there had been no pretense of complying with the law, and the board decided that the sub-contract should be cancelled and that the state should not pay for any work upon which the law had been violated. The work was measured and the estimated value thereof was deducted from the amount of the general contract. Commenting on this case the Commissioner states: "While the amount of money involved was not large, the principle established in this proceeding is very important, for it holds the general contractor civilly liable to a certain degree for all violations of the eight hour law committed by a sub-contractor. A violation by the contractor himself, or connived at by him, would result in the cancellation of his contract and consequent inability to obtain payment in the ordinary way for work done. Whether the courts would sustain this construction and application of the law is, of course, problematical. It must be admitted that it would be unjust to the general contractor to cancel his contract because of the wilful violation of law committed by a subcontractor; on the other hand it is entirely right that the law be enforced by deducting from the general contract price the full value of the work done upon which the violation occurred, for it is obvious that if this course is not adopted, violations by subcontractors would become common and would go unpunished. But if the general contractor knows that a violation by one of his sub-contractors means a definite financial loss to him, he is going to see that no such violation occurs." The other case was in Schenectady and arose on a small contract for the laying of a strip of concrete pavement, the value of which amounted, all told, to but a few hundred dollars. The contractor required or permitted his workmen to work more than eight hours a day. Complaint was filed and promptly investigated. The facts were as alleged, but it was found that the Deputy Commissioner of Public Works had authorized the contractor to work his employes on said contract more than eight hours in each calendar day. The Department of Labor immediately served the notices required by law, taking the ground that the action of the Department of Public Works in authorizing the contractor to disregard the law was unwarranted and unlawful. Payment of the contract price was withheld for a time, but eventually the Deputy Comptroller of the city audited and authorized payment of the sum due to the contractor. An attempt was made to secure the consent of the Commissioner of Labor to such payment, but without avail. Commenting on this the report says: "The responsibility for this particular violation of law rested primarily upon the official who apparently did not recognize the difference between an exigency and an emergency, as defined in the statute governing hours of labor on public work. The contractor, on the face of the facts, acted in good faith and was entitled to receive payment for work done. The penalty for infraction of law should be visited upon the official who stupidly vetoed an act of the Legislature."

Irrigation and Drainage Work.

A number of dirt moving jobs, which seem to merit more than a passing notice, have been let the past week. The largest of these is the contract for the extension of the Canadian Pacific Ry. Co.'s irrigation system into the eastern section of the irrigation block in the province of Alberta, Canada. This contract—by the way, one of the largest awarded in western Canada in recent years—calls for the moving of some 28,000,000 cu. yds. of earth. The contract price was about $5,230,000, which was practically $250,000 under the company's estimate. The work is to be started at once and is to be completed in five years. The system will provide for the irrigation of some 540,000 acres and will require a reservoir with a storage capacity of 300,000 acre feet. In passing it may be noted that the resulting lake is to be called Lake Newell, in honor of F. H. Newell, director of the U. S. Reclamation Service. The successful bidder for the work was James McDonnell & Co., with whom are associated Winter, Boomer & Hughes and Grant Smith & Co., all of Spokane, Wash. Another contract of interest was the one awarded at East St. Louis, Ill., for the construction of the Cahokia Creek diversion channel. This is the first contract in a comprehensive scheme for levee and drainage work involving the expenditure of $5,000,000 or $6,000,000 which the East Side Levee and Sanitary District of East St. Louis is to install. The contract just let involved 1,427,900 cu. yds of excavation. The contract was secured by S. R. H. Robinson & Son Contracting Co. of St. Louis, Mo., at a total of $259,153. Two large drainage contracts were also let during the past week, G. A. McWilliams, 702 Royal Insurance Co., Chicago, Ill., securing both contracts. The first contract calls for the construction of ditches to drain 20,000 acres of land in Dodge county, Wisconsin, for a land company. The work consists of 20 miles of main ditch, 80 to 110 ft. top width and 8 ft. deep, and 40 miles of lateral ditches, 25 to 30 ft. top width and 7 to 8 ft. deep. The total excavation amounts to 800,000 cu. yds. The other contract is the initial piece of work for draining a 1,000,000 acre tract of land in Louisiana. The contract calls for the drainage of 50,000 acres of land and requires the construction of 138 miles of drainage canals and 120 miles of navigation canals. This work is also to be done for a private company.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Missouri Pacific Ry. has awarded the grading contract for double tracking the Arkansas Division from McAlmont to Bald Knob, Ark., to the Walsh Construction Co., of Davenport, Ia.

The South West Texas Construction Co., Keener, Ark., has the contract for constructing the Arkansas & Northwestern R. R. The L. Clemens Construction Co. has the contract for constructing the first 16 miles. The contract includes 100,000 cu. yds. of earth excacation and 50,000 cu. yds. of embankment. Of the road 3½ miles have been graded and seven miles of right of way cleared. The objective points of the road are St. Louis, Mo., and Paris, Tex. T. A. Morton, Keener, Ark., is Chief Engineer.

CALIFORNIA.

The Humboldt & Eastern Ry. Co. is projecting a 175 mile electric line east from Eureka, Cal. Surveys have not been made as yet nor has the construction capital been secured. The chief engineer has not been selected as yet. W. S. Clark, Eureka, Cal., is president.. H. L. Jackman, Eureka, Cal., is also interested.

COLORADO.

The Denver & Rio Grande Ry. has awarded the contract for double tracking 10½ miles of line from Goodnight to Swallows to the Utah Construction Co., Ogden, Utah. The contract includes 125,000 cu. yds. rock excavation and 355,000 cu. yds. embankment. The Denver & Rio Grande Ry. has also awarded the contract to the Utah Construction Co. for 1¾ miles of double track from Pando tunnel to Pando. This contract includes 35,000 cu. yds. of rock excavation and 20,000 cu. yds. of embankment. The contracts include the following bridges, all for double track: Three 16 ft. and eight 24 ft. I beam bridges, two 80 ft. through girders and one 86 ft. through girder. The contracts also include about 5,000 cu. yds. of concrete masonry.

LOUISIANA.

The Natchetoches East & West Ry. has completed surveys for its projected 38-mile line from Natchitoches to Colfax, La., down Cane River. The capital for construction has not been secured as yet. Construction contracts are to be let as soon as the capital is secured. Harry Percy, Natchitoches, La., is Chief Engineer and C. H. Teal, Colfax, La., is President.

NORTH DAKOTA.

The Boone Contracting Co., Stanley, N. Dak., is working two grading machines on its contract on the Stanley branch of the Great Northern, and will complete its work in about a month. The company is in the market for more work to move onto at once. Other subcontractors at work on the Stanley branch include the following: Kimball Bros. have moved on the work with two machines, two engines and 30 teams, and are piling up big estimates. Stanley Bros have taken work north of Powers Lake and are moving in with their outfit. Colby Smith is working a good size machine outfit on the line, and J. Nueville is working 60 teams on a mixed outfit of car gang machine, wheeler and slip outfit.

OHIO.

The Roberts & Abbott Co., Consulting Engineers, Cleveland, O., have been employed to make a report on a projected line radiating from Mt. Gilead to Mansfield, Mt. Vernon, Marion, Delaware & Galion. The projected length is 107 miles. The company to build and operate the road has not been organized as yet.

OKLAHOMA.

The Oklahoma Public Service and Interurban Lines now has surveys under way for 100 miles of line, radiating from Stillwater, Okla. The capital for construction has been secured and contracts for the Morrison division, calling for 13 miles of interurban line, are to be let today (May 25). L. J. Lampke, Stillwater, Okla., is president and R. G. Sturgeon, Stillwater, Okla., is chief engineer.

PENNSYLVANIA.

Preliminary surveys have been made for the Ephrata & Lebanon Street Railway, a charter and rights of way obtained, and the company is now engaged in endeavoring to secure the necessary finances to build the road. F. H. Shaw, Lancaster, Pa., is Engineer.

TEXAS.

The Wichita Falls route has now under construction an extension from Elk City, Okla., north to Hammon, Okla., a distance of 18 miles. Grading contracts are let by the company in short sections to sub-contractors. The bridging, building and track laying will be done by the company. J. A. Kemp is president, Frank Kell vice president and general manager, Wichita Falls., Tex., and R. A. Thompson, Wichita Falls, is chief engineer.

UTAH.

The Utah Construction Co., Ogden, Utah, has work well under way on its contract for constructing the Bingham & Garfield R. R., a 17-mile line in Salt Lake County, Utah, between Bingham and Garfield. The contract includes 300,000 cu. yds. of earth excavation, 800,000 cu. yds. of rock excavation, 1,000,000 cu. yds. of embankment, 6,200 lin. ft. of rock tunnels, 7,000 cu. yds. concrete masonry and three steel and concrete bridges of 500 to 800 ft. The subcontractors on the work are as follows: Boyer Bros., R. Palfreyman, D. Palfreyman, Taylor Bros., W. M. Smith, Wasatch Constructing Co., Stephen Rockish, and F. Meyers & Co., all of Utah.

WASHINGTON.

The Walla Walla Valley Ry. Co., recently mentioned in this paper, has been formed to take over the railroad property of the old Northwestern Corporation. The company has 24 miles of line extending from Walla Walla, Wash., to Milton and Freewater, Ore. No new construction is contemplated at the present time. Guy W. Talbot, Portland, Ore., is president.

CANADA.

Jackson & Goldie, Winnipeg, Man., have been awarded the contract for ditching work along the line of the Canadian Pacific Ry. from Fort William, Ont., to Winnipeg, Man. Bids for this work were opened May 2, at Winnipeg, by Frank Lee, Division Engineer.

The O'Boyle Bros. Construction Co., Sault Ste. Marie, Ont., has been awarded the contract for the clearing, grading and bridge work on a 31 mile extension of the Algona Central & Hudson Bay Ry. from Hawk Lake Junction to Hobon. Bids for the work were opened April 30 by C. H. Coburn, chief engineer, A. C. & H. B. Ry.

Bids are asked by A. J. McGee, 25 Toronto St., Toronto, Ont., Secretary-Treasurer of the Temiskaming & Northern Ontario Ry., until noon, June 8, for clearing, grading, embankment protection, driving of piles, building of culverts and laying of tile that may be required in connection with the construction of a branch line for the Temiskaming & Northern Ontario Ry., between North Bay and Nipissing Junction. Plans and specifications may be seen at the office of S. B. Clement, Chief Engineer, North Bay, Ont., and the Secretary-Treasurer, 25 Toronto St., Toronto.

Power Developments, Levees, Drainage and Irrigation Works.

ILLINOIS.

Bids are asked by C. W. Brown, Engineer Drainage District, Room 12, Scott Block, Jacksonville, until 11 a. m., June 2, for 100,000 cu. yds. of levee work and 74,000 cu. yds. of ditch work in the Meredosia Lake drain and levee district in the west part of Morgan and Scott counties, Illinois.

Bids are asked until 10 a. m., June 9, by Commissioners of Union Drainage District No. 1, towns of Vance and Catlin, Vermilion county, Ill., at Fairmont, Ill., for the following work: Excavating dredge ditch two miles long, total amount of yardage estimated at 50,822 cu. yds. Furnishing and laying 400 ft. of 30-in., 1,650 ft. of 27-in., 4,600 ft. of 20-in., 4,180 ft. of 18-in., 1,350 ft. of 16-in. 2,400 ft. of 12-in. standard shale tile.

Bids were opened May 16, by the East Side Levee and Sanitary District, of East St. Louis, Ill., for the construction of the channel for the division of Cahokia Creek, the contract being let to the S. R. H. Robinson & Son Contracting Co., 905 Chemical Bldg., St. Louis, Mo., at $259,153. The itemized bids received on this work were as follows: (1) standing for S. R. H. Robinson & Son Contracting Co.; (2) for Shaw, Foohey & McGinnis, Bement, Ill., and Fort Wayne, Ind.; (3) for Lorimer & Gallagher Co., Chicago, Ill.; (4) for James O. Heyworth, Chicago, Ill.; (5) for E. M. Graves, Cleveland, O.; (6) for Scott, Hannon & Hickey, St. Louis, Mo.; (7) for Yale & Reagan, Chicago, Ill.; (8) for R. A. Brown, Washington, Ind.; (9) for W. W. Brown Construction Co., East St. Louis, Ill., and (10) for the Hercules Co., New Orleans, La.:

IOWA.

Bids are asked by H. B. Frase, County Auditor, Des Moines, Ia., until noon, June 20, for the construction of a drainage ditch in Drainage District No. 11, in Elkhart Township, Polk County, requiring the moving of 53,471 cu. yds. of earth. Work is to be completed on or before Nov. 1, 1910.

The following bids were received by the Supervisors for Des Moines County Drainage District No. 1, at Burlington, Iowa, on May 11th, for the pumping station building and Station Engineer's dwelling: Traut & McCarthy, Beardstown, Ill., $48,480; Jansen & Zoeller, Pekin, Ill., $55,800; Harney Bros., Aledo, Ill., $48,800; H. A. Beck, Burlington, Ia., $53,900; Brewster & Evans, Peoria, Ill., $49,500; John Thye, Burlington, Ia., dwelling only $4,156. The contract was awarded to Traut & McCarthy. The Harman Engineering Co., Peoria, Ill., are the engineers for the Drainage District.

Bids are asked by the County Auditor, Burlington, Ia., until 2 p. m., June 9, for the construction of the following ditches and tile drain work: 6,900 ft. of 80 ft. ditch, 98,500 cu. yds.; 140,400 ft. of 60 ft. ditch, 1,298,500 cu. yds.; 8,300 ft. of 40 ft. ditch, 53,500 cu. yds.; 3,500 ft. of 20 ft. ditch, 5,800 cu. yds.; 45,200 ft. of 10 ft. ditch, 103,150 cu. yds.; 900 ft. of 8 ft. ditch, 9,100 cu. yds.; 49,350 ft. of tile drain, ranging in size from 10 in. to 24 in. Plans and specifications are on file and may be seen at the office of the County Auditor in Burlington, Ia., and at the office of the Harman Engineering Co., 120 Fredonia Ave., Peoria, Ill. Official advertisement will be found elsewhere in this issue.

LOUISIANA.

Bids are being asked by Lt.-Col. Lansing H. Beach, U. S. Engineer, New Orleans, La., until 11 a. m., June 10, as noted in our last issue, for dredging at Chefuncte and in Bogue Folia Rivers, La. The work calls for dredging sand, clay and mud for a channel through the bar at the mouth of the Chefuncte River, and the dredging of a channel through shoals in the Bogue Falia River. About 30,000 cu. yds. of dredging will be required.

G. A. McWilliams, 169 Jackson Blvd., Chicago, Ill., has been awarded the contract for draining 50,000 acres of a 1,000,000 acre tract near Lockport, recently purchased by interests identified with Trowbridge & Niver Co., Chicago. The land is in Terre Bonne parish, east of Bayou Lafourche and 50 miles west of New Orleans. The initial drainage contract calls for 138 miles of drainage canals and 120 of navigation canals. The developers will construct roads, install pumping plant, transmit electricity for farm use, etc. The work outlined will require two years for completion and it is understood that this initial development will be followed by others of equal size until the entire 1,000,000 acres are developed.

Bids are asked by Lt. Col. Lansing H. Beach, U. S. Engineers, New Orleans, La., until 11 a. m., June 15, for building lock and dam and lockkeeper's dwelling on Bayou Teche, La. The site of the proposed work is 3½ miles below St. Martinville, La., which is on a branch line of the Southern Pacific R. R. The work consists in furnishing all the plant, materials and labor necessary to construct a concrete lock on pile foundations with wooden gates and all accessories; a timber-crib dam on pile foundation, with concrete abutment; making the excavation necessary for widening stream above and below the dam; placing all bank protection; and building one lockkeeper's dwelling. The work includes the following approximate quantities: Excavation, 40,000 cu. yds; foundation piles, 48,260 lin. ft.; guide piles, creosoted, 6,100 lin. ft.; sheet piles, wooden, 166,250 ft. B. M.; sheet piles, steel (alternative bid), 18,475 sq. ft.; back filling and embankment, 7,469 cu. yds.; concrete, 8,480 cu. yds.; concrete, reinforced including steel (wing walls), 138 cu. yds.; reinforced concrete including steel (abutment, alternative bid), 191 cu. yds.; valves, cylindrical, No. 4; structural steel, 14,510 lbs.; steel reinforcement (lock floor), 252,394 lbs.; bolts and special irons, 30,702 lbs.; cast iron, 41,750 lbs.; timber in permanent construction, 132,490 ft. B. M.; timber, creosoted, 96,389 ft. B. M.; timber in gates, 36,254 ft. B. M.; timber shoring, 10,000 ft. B. M.; riprap filling, 2,614 cu. yds.; bank protection, riprap, 500 sq. yds.; gauge tile (4 gauges), 76 lin. ft.; mattress protection, 2,011 sq. yds.; lockkeeper's dwelling, complete, No. 1; tile drain, 350 lin. ft.; walks and concrete paving, 90 sq. yds.; capstans, No. 2.

MASSACHUSETTS.

Bids were received April 25 by the Metropolitan Park Commission, John R. Rablin, Engineer, for excavating a new channel for Alewife Brook, Spy Pond to Mystic River, Belmont, Cambridge, Arlington and Somerville, the contract being awarded to the Eastern Dredging Co., Boston, at the following bid: Spypound to Arlington Branch, B. & M. R. R., 50,000 cu. yds., at 59 cts.; Arlington Branch, B. & M. R. R., to Massachusetts Ave., 2,500 cu. yds., at 87 cts.; Massachusetts Ave., to Broadway, 22,000 cu. yds., at 77 cts.; Broadway to Mystic River, 3,500 cu. yds., at 87 cts.; total, $51,660.

MINNESOTA.

Bids are asked by L. P. Larson, County Auditor, Redwood Falls, Minn., until 1 p. m., June 2, for constructing Ditch No. 12 of Redwood county, the estimated cost of which is as follows: Tile work, $39,992; dredge excavation, 251,159 cu. yds., $20,036; concrete work on main ditch, $592.

Bids are asked by J. B. Lemire, County Auditor, Aitkin, Minn., until 10 a. m., June 6, for the construction of Aitkin county ditch No. 14. The main ditch is 5½ miles long, 4 ft. wide at bottom, average depth 6 ft., slopes 1 to 1, requiring excavation of 70,532 cu. yds. excavation of clay and loam. In addition there will be one open lateral 2,800 ft. long, 4 ft. wide at bottom, 6 ft. deep, containing 5,571 cu. yds.

NORTH CAROLINA.

The Lower Creek Drainage Co. of Lenoir, N. C., has placed an order for a 1¼ yd. dipper dredge and will dig a canal 12 miles long requiring the excavation of 360,000 cu. yds. The work will take about 12 months. A. A. Kent, Lenoir, N. C., is secretary of the executive committee.

UTAH.

The city of Provo, Utah, is planning to erect a hydro-electric plant, to cost $110,000. The city is also to construct water works to cost $90,000. An election to vote on issuing bonds for the above work was held May 24. L. C. Kelsey, 402 Dooly Bldg., Salt Lake City, Utah, is consulting engineer for both pieces of work.

WASHINGTON.

The Secretary of the Interior has rejected all bids received April 22 for the contract for excavation of 40 miles of sub-laterals on the Tieton unit of the Yakima project and has authorized construction by force account. J. S. Conway, North Yakima, Wash., is project engineer.

WISCONSIN.

The Rock River Valley Land Co. of Racine, Wis., has contracted with G. A. McWilliams, 702 Royal Insurance Bldg., Chicago, Ill., for the construction of a system of ditches to drain 20,000 acres of the company's lands in Dodge County, Wisconsin. The work will consist of 20 miles of main ditch, 80 to 110 ft. top width and 8 ft. deep, and 40 miles of lateral ditches, 25 to 30 ft. top width and 7 to 8 ft. deep. The total excavation amounts to 800,000 cu. yds.

CANADA.

The contract for the construction of Section No 6 of the Ontario-Rice Lake Division of the Trent Canal has been awarded to Messrs. Haney, Quinlan & Robertson, address care of M. J. Haney, C. E., Home Bank Bldg., Toronto, Ont.

Joseph J. Fallon, Vincent L. Fallon and Thomas D. Fallon, composing the firm of Fallon Bros., Cornwall, Ont., as noted in a previous issue, have been awarded the contract for improving the upper entrance to Lock 17, Cornwall Canal at Cornwall, Ont. The contract includes 38,000 cu. yds. of earth excavation, 2,500 cu. yds. rock excavation, 20,000 cu. yds. dredging, 620 ft. crib work, requiring 600,000 ft. B. M., 4 ft. x 12 in. timber, 1,960 cu. yds. plain concrete and 1,025 cu. yds. stone masonry. Subcontracts on the dredging were to be let at once.

The Southern Railway and the Georgia & Southern & Florida Ry., are planning the improvement of terminals at Jacksonville, Fla., through the St. Johns River Terminal Co. The work includes enlarging freight yards north of Bay St., between Catharine and Marsh Sts.; also enlarging and complete rearrangement of the tracks south of Bay St. along the river front between Catharine and Main Sts., with a view of modernizing the yards for the quicker handling of traffic and for the expeditious handling of the traffic of the Clyde Steamship Company, which is to erect giant piers and terminals along the river front of the Terminal Company, between Market and Washington Sts., plans for which have been completed. W. C. Shaw, Jr., Macon, Ga., is Chief Engineer.

All right of way through Phoenix, Ariz., for which the Buckeye Railroad has been contesting, has been secured and the construction of the road will be continued at once, under direction of the Arizona Eastern. L. H. Long, Tucson, Ariz., is Assistant Chief Engineer of the latter company.

Advices from Pioche, Nev., are to the effect that H. S. Wanamaker, General Manager Mountain, Valley & Plains R. R., Amistad, New Mex., is securing data as to traffic for the proposed extension of its line through Pioche and Lincoln Counties. It is understood the company is planning to eventually extend the line from Cimarron, New Mex., to the Pacific Ocean.

The Fernwood & Gulf R. R. now operating between Fernwood, Miss., at Tylertown, is stated to have let contracts for additional trackage, with the idea of ultimately extending the road to the Gulf. F. B. Enochs, Fernwood, Miss., is General Manager.

It is reported that W. A. Wall, Honolulu, Hawaii, is planning the construction of a 60-mile railroad in Hawaii and a bill authorizing the work has just been introduced into the Federal House Committee on Territories.

An announcement has been made by Ogden Mills, President of the Virginia & Truckee R. R. Co., at Reno, Nev., that no immediate extension of the line would be built. Surveys are, however, being made in the direction of Bridgeport and Mono Lake.

According to a statement reported to have been made by James Douglas, President, El Paso & Southwestern Ry., New York City, matter of constructing a line to Tucson, Ariz., from Benson, and from there to Port Lobos, Mex., is under consideration.

The Shattuck-Edinger Construction Co., Los Angeles, Cal., has been awarded the grading contract for the Buckeye R. R., from Buckeye, Ariz.

The City Council of Summit, Miss., has granted a franchise to the Summit-McComb Motor Line Co., for a right of way within the corporate limits for the street car line, which is being built to connect Godbold Mineral Wells, Summit and McComb.

Paternan & Lamro, contractors of the Northwestern, are preparing to start active work at once on the Dallas-Carter extension in South Dakota at once.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

City Council of Hope, Ark., has been considering a proposition of J. H. Black, Jr., Texarkana, Ark., for a street railway franchise.

Heavier steel is being laid on a short railroad line leading out to a lumber mill eight miles from England, Ark., and it is said that the road is to be extended to Stuttgart, 26 miles from England. Two other surveys have been made to different points, one to Pine Bluff and the other to Hazen on the Rock Island.

Walter J. Miller of Lamar, Mo., associated with St. Louis capitalists, is said to be preparing to extend the Valley Railroad into Pine Bluff. It is Mr. Miller's purpose to build the road north from McCreaner, Ark., to Searcy, where it will feed the Missouri and North Arkansas, and thence south from McCreaner to Pine Bluff, via Robroy over the Arkansas River, where it will connect with the Cotton Belt. J. A. Watkins of Little Rock is receiver of the road.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The United Railroads, of San Francisco, has been requested to construct a car line on 15th ave., at San Francisco, south from San Bruno ave. to Railroad ave., giving the Mission district another cross-town line and connecting the Bay View and Potrero districts with the Mission.

The field work has been practically completed for an extension of the 22nd St., Oakland, line of the San Francisco, Oakland & San Jose Ry. through East Oakland, Dimond, Allendale, Melrose Heights, Elmcrest and East San Leandro. The road is ultimately to be built to San Jose.

Hallwood Irrigation Co., of Marysville, rejected bids on all but one section of its irrigation canal. This section, requiring the removal of 8,800 cu. yds. of earth was awarded to J. Wise, at 12 cts. per cu. yd. The other sections will be readvertised. Leslie B. Crook is engineer.

The Chamber of Commerce of Long Beach is advocating a recommendation that the city build and maintain its own railroad around a portion of the harbor.

Advices from Santa Monica, Cal., state that the Los Angeles-Pacific Ry. will be extended out Seventh St., from Oregon to the San Vicente Blvd., over 14th St., and along Montana back to 7th.

Track laying on the Holton Interurban extension west of El Centro, Calif., to New River, is about to start. The line is the easterly connection of the San Diego & Arizona R. R., now under construction. It is expected to finish the work by July.

The Stockton Terminal & Eastern Ry. Co., has been granted a franchise by the City Council of Stockton, Cal., for entrance to that city from Jenny Lind, on Roosevelt Ave., at East St., to Union, thence to Fremont, along Miner Channel by trestle to American west on Miner to Center, thence south to Stockton channel.

The Vallejo & Northern R. R. Co. has instituted suit to condemn right of way through a tract of land in Jameson Canyon between Cordelia and Napa Junction on the county line of Solano and Napa Counties. It is the only available route for the construction of a line across the range of hills. T. T. C. Gregory is President of the company.

The City Council of Los Angeles has granted the petition of Robert Marsh for a street railway franchise on 39th St., from Vermont Ave. to Western Ave.

Sharp-Hauser Construction Co., Germain Bldg., Los Angeles, Cal., are to start work shortly on their contract for the construction of the Wahtoke branch extension of the Santa Fe. A rock crushing plant is now being installed at Santa Fe to prepare rock for the roadbed.

According to reports from Fruitvale, Cal., the 22d St. line of the San Francisco, Oakland & San Jose Ry. through Dimond, Allendale, Melrose Heights, Elmcrest and East San Leandro will be constructed soon. Surveyors have practically finished laying out the right of way.

Repair work on the line of the San Pedro, Los Angeles & Salt Lake R. R., is nearly completed and it is expected the road, which was recently washed out by high water, will be thrown open to traffic within 30 days. The cost of the work is estimated at about $4,000,000. E. G. Tilton, Los Angeles, Cal., is Chief Engineer of the company.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Las Animas state that the Rule Creek Reservoir Co. has awarded a contract to the Kaw Construction Co., Kansas City, Mo., for the construction of a large dam to water about 20,000 acres of land lying along Rule creek from four to ten miles southeast of Las Animas. W. A. Howard, Dr. Loub and R. A. Bonita are the principal holders in the company.

The Montrose Chief Canal & Reservoir Co., of Montrose, has been incorporated with a capital stock of $10,000, the incorporators being J. V. Lathrop, John I. Newland and Robert K. Humphrey.

The Meadows Reservoir project, the filing for which was made about a year ago by E. E. Udlock, Grand Junction, is reported to have been purchased by C. C. and G. J. Magenheimer, who are just completing the construction of the Orchard Mesa ditch. The Meadows Reservoir project contemplates the construction of a reservoir in the meadows above Collbran in the Plateau Valley, the irrigation of a large tract of land including the Sunnyside project, the erection of a power plant with a capacity of 10,000 hp., and the building of an electric railroad from the Plateau Valley to Grand Junction via Orchard, Mesa, will be built.

Surveys for the Stove Prairie Reservoir of the Laramie-Poudre Reservoir & Irrigation Co., of Fort Collins, have been completed and bids will be asked soon. The dam will be one of the highest in the state, about 250 ft. The capacity will be 35,000 acre-feet. The cost will be $500,000, while engineering supervision, road building and other incidentals will bring the total to $600,000. It will be located 20 miles west of Fort Collins, on the Cache la Poudre River.

Denver capitalists represented by George W. Vallery and J. H. Lumsden and J. H. Vickery of Grand Junction, closed a deal for a 5,000-acre tract on Hunter's mesa near Rifle and the construction of a reservoir and irrigation ditches to cost $500,000. All the land will be irrigated for fruit. Work will be started without delay.

D. W. Gill, right of way agent, Colorado Railroad Co., has closed contracts for nearly all right of way necessary for the construction of a connecting link between the Colorado & Southern and the Burlington yards at Cheyenne, Wyo.

Carmon Layton of the Paradox & Pacific R. R. is reported to have announced at Montrose, Colo., that a feasible route had been found for the construction of the line from Montrose to Bedrock over the Horefly range of hills and that a preliminary survey preparatory to laying out the final line will be run at once.

The Denver, Laramie & Northwestern R. R. has filed a mortgage to the Manhattan Trust Co., New York City, to secure a bond issue of $22,500,000 for the construction of a line through to Seattle, Wash., and the north Pacific Country. E. A. Buck, 511 E. & C. Bldg., Denver, Colo., is Chief Engineer of the company.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Brinson Ry. Co. has been chartered with a capital stock of $1,500,000 and headquarters at Savannah, Ga. The new company will take over the Brinson Ry., at present operating 72 miles of line, and will build extensions. The charter calls for 180 miles of line running from Savannah in a northwesterly direction to Athens. G. S. Burtchael, Springfield, Ga., is Chief Engineer of the Brinson Ry.

The Rome & Northern R. R. which has just placed in operation an extension from Rome to Shackleton, 17 miles, has surveys under way for an extension north, and it is expected that the road will ultimately be extended to Knoxville. H. M. Smith, Rome, Ga., is Chief Engineer.

Surveys are to be started shortly for the projected line of the Fitzgerald, Ocilla Electric Ry. & Power Co. The first section of the line to be constructed will be between Fort Valley, Ga. and Jacksonville. As proposed, the line will be 210 miles long. B. B. Gray, Pinebloom, Ga., is President. The project is being promoted by S. Tilden Holtzendorff, 61 Fifth Ave., New York City.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys have been completed and arrangements made for the construction of the proposed line of the Idaho Central R. R., paralleling the Oregon Short line from a point west of Pocatello, Ida., through Richfield and Camas Prairie. The new line will be 200 miles in length.

Work is progressing rapidly on the Metaline extension of the Idaho & Washington R. R. The work includes the construction of several tunnels, considerable side hill cut and a 300 ft. bridge across Box Canyon on the Pend Orielle River. W. C. Smith, Spirit Lake, Idaho, is Chief Engineer of the Idaho & Washington Northern.

The Boise & Interurban Ry. Co. of Boise has announced that work on the proposed extension of its line to the East side addition or a point near the Natatorium, would commence at once, the first step to be the electrification of the Idaho St. line east from 7th St. to Ave. B. for which the rails were laid at the time of the original construction.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Egyptian Traction Co. has applied to the City Council of Carterville for a franchise through that city. This company, as previously noted, proposes to build a line from Mt. Vernon, Ind., through Eldorado, Harrisburg, Marion, Carterville, Carbondale and to Murphysboro, connecting the McGowan system in Indiana with the McKinley system in Illinois. R. B. Clark, Harrisburg, Ill., is Chief Engineer.

The Chicago & Northwestern Ry. has been purchasing a considerable amount of land in Proviso, a suburb of Chicago, with a view, it is said, of establishing freight yards and roundhouses there. The plans are said to contemplate making a through freight terminal which will be capable of accommodating 10,000 freight cars and a roundhouse wherein can be stalled fully 90 locomotives.

The Western Indiana Construction Co. has begun work on the first section of the Oil &

Coal Belt Ry. This first work consists of resurfacing the old railroad from Dorrisville to Galatia. This is being put in shape for operating, a construction train hauling the material for the loop line and extensions. The Galatia line is to be working within four months.

The Chicago, Milwaukee & St. Paul R. R. Co. has acquired about 514 acres of land in the Township of Leyden, a suburb of Chicago. The company has in all about 800 acres of land at that place, which will be utilized for freight yards.

The Chicago, Milwaukee & St. Paul Ry. is reported to be negotiating with the Chicago & Milwaukee Electric Ry. Co. for the purchase or lease of a portion of the right of way from Highwood to Milwaukee in order to enter into competition with the North-Western road. The Milwaukee road, it is said, seeks an entrance to Lake Forest, Waukegan and other cities, but especially desires to obtain business at Fort Sheridan and the United States Naval Training station. Alterations are now being made in the line of the Chicago-Milwaukee company at Highwood so that the Milwaukee road may build a track from Rondout to that point.

The Illinois Valley Gas & Electric Co. recently chartered, is said to be planning to build a $2,000,000 power plant at Streator, and the company is reported to have contracts and franchises to light the cities of Streator, Morris and Ottawa and twelve towns in La Salle, Grundy, Marshall and Woodford counties, and may extend farther south and west. The company was organized by Samuel Insull, C. A. Munroe, C. H. Randle and Frank G. Logan, all of Chicago.

Press reports from Bushnell state that work will be started soon in Lamoine township, McDonough county to protect several hundred acres of good farming lands from overflow. It is proposed to dam the Colmar branch of Crooked creek and turn its waters into the main stream through an artificial channel.

Business men of Quincy are investigating the possibilities of an interurban road from Quincy to Paris, passing through Springfield, Shelbyville, Mattoon and Charleston. James K. Lauher, Paris, Ill., may be interested.

Announcement has been made that the Tri-Cities & Northeastern interurban line, surveys for which are now under way, will be completed through to Morrison, Ill., the western terminus to be Silvis. The estimated cost of construction is $1,500,000. It is stated that all arrangements for financing the project have been made. J. W. Crowley, President of the People's Construction Co., Moline, Ill., is a director of the Tri-Cities & Northeastern.

The stockholders of the proposed Decatur, Sullivan & Mattoon Interurban line have again taken up the matter of building the line from Mattoon. W. A. Steel, Sullivan, Ill., is interested.

The Chicago & Alton R. R. is planning to spend $1,000,000 in Bloomington if the residents of that city raise $165,000 for the necessary land, adjacent to the present yards. Of this amount $750,000 will go for the enlargement of shops, $75,000 for viaducts, $50,000 for a third main track and the $75,000 for a passenger station.

Advices from Peoria, Ill., state that the grading work is well under way for the ⅛ mile line of the Peoria Ry. Co., from Seiberling Ave., to Grand View Drive and that track laying will be complete about June 15. The cost of the work is estimated at $15,000.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The commissioners of Marshall county have granted a franchise for an interurban line from Bremen north to the county line. The interurban, which is to connect Bremen and Mishawaka, is being promoted by Omer F. Neff, Milford, as previously noted in these columns.

The Cleveland Construction Co., Citizens' Bldg., Cleveland, O., is reported to have been awarded the contract for the construction of double track on the Chicago, Lake Shore & South Bend Ry., from Pullman to Gary, Ind., a distance of 17 miles.

The Vandalia R. R., M. P. Tucker, Assistant Engineer, Terre Haute, is to spend $25,000 in straightening the road just west of Terre Haute, by which the line will be shortened one mile.

The Chicago, South Bend & Northern Indiana Ry. Co. is planning to lay double tracks on West Second St., in Mishawaka.

The Chicago, South Bend & Northern Indiana Railway Co., is planning the construction of a number of improvements in South Bend, Ind. The work includes the laying of double track on several of its lines.

The Pennsylvania R. R. has received bids for its track elevation work in Fort Wayne. The Wabash R. R. will do its track elevation work in the city with its own forces.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Work is to be started shortly on the improvement of the Albia & Centerville R. R. of Centerville, which was recently purchased by W. A. Boland, of New York city. The road is to be transformed into an interurban line.

The Albia Traction Co., of Albia, is making arrangements for building a line from Albia to Buxton, and possibly a stub line to Ward.

The Waterloo, Cedar Falls & Northern R. R., T. E. Rust, Chief Engineer, Waterloo, Ia., has planned improvements to its lines at Waterloo which will involve the expenditure of $150,000. The most important part of the plan is double-tracking the Cedar Falls line from Broadway to Electric park, the erection of freight house and shortening the Denver line by eliminating the semi-circular swing around the Litchfield factories.

Contracts for furnishing rock and brush for the use of the government fleet improving the Dubuque division of the Mississippi River have been let as follows: Rock: Thomas Welsh, Cuba City, Wis., 10,000 cu. yds. at 70 cts.; Charles Pape, Wapello, Ia., 2,000 cu. yds. at 76 cts.; Le Clair Stone Company, Le Clair, Ia., 6,000 cu. yds. at 80 cts. Brush: Thomas Welsh, Cuba City, Wis., 18,000 cu. yds. at 17 cts.; Granke & Rich, Stoddard, Wis., 18,000 cu. yds. at 17c.

Preliminary surveys are to be started at once by an engineer from Des Moines, Ia., for the proposed Norfolk, Neb.-Newman Grove Electric Railway. The Commercial Club of Norfolk, Neb., is promoting the project.

Engineers of the Chicago Great Western R. R. Company have completed a preliminary survey for the construction of a line from Denver Junction to Waterloo, Ia., connecting the Oelwein-Hampton Division and the Oelwein-Kansas City Division of the road. As projected, the route will be from Denver Junction southeast to the northern edge of the Blackhawk country, thence southward to the western boundary of Bennington township and along Ellsworth creek to the East Waterloo township, to an entrance to the city near the Rapid Transit tracks. W. H. Chadbourn, Chicago, Ill., is Engineer of the Great Western.

The Anamosa-Oxford Junction Light & Co. of Anamosa, is considering the advisability of building an interurban line from Anamosa to Olin. The company has two power houses on the Wapsie River, one at Oxford Junction and the other at Anamosa, which could supply the electric power to operate such a line, and the road could be built along the Wapsie River, with but little grading.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of Montgomery county held a meeting at the rooms of the Independence Commercial association at Independence, and appointed a committee consisting of E. P. Allen, J. H. Brewster and J. M. Anderson, to take steps for clearing and straightening the Verdigris River for a distance of about 40 miles. About 19,200 acres of land are affected by overflow.

The Atchison, Topeka & Santa Fe Ry., J. W. Meade, Engineer, Topeka, has appropriated $76,000 for the construction of a reservoir south of Chanute. The reservoir will cover 200 acres with a wing north and south nearly a mile long, and wing east and west lacking 500 ft. of being a mile long. The company is now obtaining its water from a small pond on the land and the city.

Advices from Atchison state that W. A. Parker, Chief Engineer of the Grand Island R. R., has started a survey between Atchison and St. Joseph. The survey line was made along the old Hall road from Doniphan to Wathena, 11 miles.

An engineering corps under supervision of J. Van Ensaeller, is making preliminary surveys for the construction of the proposed electric road from Arkansas City, Kan., to Tulsa, Okla. As proposed the line will pass through Pawhuska, Hominy and other towns between the two terminals.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The new owners of the Owensboro City Ry. Co., of Owensboro, Ky., are planning to extend the street railway lines. The construction of interurban lines is also proposed. The new owners are stockholders in the Evansville Rys. Co. of Evansville, Ind., and are also directors in the Rockport and Mt. Vernon Traction companies. The same parties have also purchased the electric lines at Henderson, Ky.

Surveys are under way for a new railway in Crittenden county. According to advices from Marion, Ky., the survey has been completed for a line to the Commodore mines, eight miles from Marion. Col. Jno. W. Wilson, Marion, is reported to be interested.

It is reported that the Chicago, Burlington & Quincy R. R., which is now building a short line to Metropolis, Ill., will continue the line to Paducah to a connection with the Nashville, Chattanooga & St. Louis R. R.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A bill has been introduced in the Louisiana Legislature by State Senator McCulloch to grant a right of way over the two sugar farms below Baton Rouge to the New Orleans & Baton Rouge electric line. It is stated that a right of way has been obtained all the way from New Orleans to Baton Rouge except through the property at Oakly and Monticello, owned by the State.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boyne City, Gaylord & Alpina R. R., W. H. White, President, Boyne, Mich., is said to be planning to construct about 25 miles of new main line track this season. Surveys are under way east of Gaylord for the extension.

The Detroit United Rys. Co. is continuing to secure right of way for the proposed double track between Mt. Clemens and Detroit. The greater part of the right of way has been secured and it is said that by the end of the year the company will be in possession of a continuous strip of land 33 ft. wide, on the east side of the Gratiot road from the Clinton river bridge to Leesville. It is possible that grading and track laying may be commenced before the entire strip is secured.

H. S. Payne, Iron Mountain, Mich., has started work on several contracts in the Stambaugh Iron River district of the Menominee range for the Northwestern road. The largest contract is for the construction of a track two miles in length leading to the Tully mine. At the James a spur will be built about half a mile in length and at the Baker mine a short rockpile track.

The Hoose & Person Construction Co. of Iron Mountain, which is stripping the Portland mine at Michigamme, has been

awarded a contract for building 3 miles of track in the Michigamme district for the Chicago & Northwestern road. The new branch will traverse a rough country requiring much filling. It is the intention of the construction company to make use of the earth stripped from the Portland mine formation.

G. A. Skinner, Mount Clemens, has been securing land on the Little Muskegon River, south of Morley, for a proposed power dam to be erected at that place

The Grosse Isle Ry. Co. of Wayne, has been incorporated with a capital stock of $40,000.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hibbing Street Ry. Co., recently incorporated, has applied for a franchise at Hibbing and is planning to have construction work started on its street railway as soon as the franchise is secured. H. C. Hanson, Hibbing, Minn., is President and J. A. Redfern, Hibbing, is Secretary.

The Duluth Street Ry. Co., Herbert Warren, Manager, is considering extending its tracks in the Second ward at Duluth.

The Gulbranson brothers have a contract at Foxboro for the Great Northern Ry. Co.

The Northwest terminals of the Northern Pacific Ry., W. L. Darling, Chief Engineer, St. Paul, at Minneapolis, are to be enlarged and a round house and shops built.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are under way for a proposed route for a ditch to straighten Grand River, from the Grundy County line to the Chariton County line. Owners of 140,000 acres of bottom land in Livingston County, are back of the project which will cost about $1,000,000. A. H. Bell, Bloomington, Ill., is making the surveys.

All engineering plans for the Union station and terminals at Kansas City, of the Union Station & Terminal Co. have been completed and contracts are to be let at once. The building of the Belt Line, the freight house and the station itself, will be awarded separately, in order to hasten the work. The steel for replacing the tracks of the old Belt Line has arrived and the work of laying it has been started.

The Missouri Valley Transportation Co., W. K. Kavanaugh, President, St. Louis, Mo., is selecting sites on the Mississippi River for docks for its barge line. It is probable that the first dock will be built at Cape Girardeau.

Davis & Blair, Joplin, Mo., have been awarded the contract for the grading of the Laclade, Dallas & Western, a new steam railroad recently chartered to build from Phillipsburg, a station on the main line of the Frisco, 194 miles southwest of St. Louis, to Buffalo, Mo., the county seat of Dallas. Work will be commenced at once.

It is rumored that the Chicago, Milwaukee & St. Paul Ry. Co. contemplates building a line from Chillicothe, Mo., to Des Moines, Ia., to secure a direct line from Kansas City to Des Moines.

Advices from Shelbyville, Mo., state that the court of Shelby County, as a result of a recent hearing, has decided to drop the proposition of organizing a drainage district on the Salt River.

The Mississippi River Commission will hold a hearing at 10 a. m., June 23, at its offices in the Ligget Bldg., St. Louis, Mo., to consider levee construction and other river improvements below Cape Girardeau.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Billings, Mont., has granted a franchise for an electric street railway to John A. Connelly, Muskogee, Okla. An election will be held June 20 to vote on approving the franchise. The franchise provides that actual work of construction must begin within 30 days from the time the ordinance passed is accepted by the applicant, and that at least four miles of track must be completed within 15 months, and the company agrees to put up a $10,000 bond, which will be forfeited to the city unless these provisions are complied with.

The City of Billings, Mont., has granted a franchise to Carl Schroeter for supplying gas to the residents of that place.

E. H. Begemann, a Holland capitalist, has announced at Spokane, Wash., where he was the guest of R. Insinger, Manager of the Hypothee Branch of Spokane, that the company of Holland capitalists he represents has decided to build an electric railway line from Lewistown to Kendall, Mont. This is the line for which the residents of Lewistown have agreed to subscribe $100,000 to $1,500,000 required to finance the project.

Right of way is being secured in the vicinity of Bozeman by the Northern Pacific Ry. for the postponed new double track between Bozeman and Logan. D. W. Driscoll, Engineer, has established headquarters at Bozeman, for the construction work.

C. A. Gibson, Fromberg, Mont., C. E., will start work upon surveys at once for the construction of a proposed street railway system in Lewiston. S. W. Gebo is promoter.

According to an announcement, reported to have been made by Howard Elliot, President of the Northern Pacific, the company is planning the construction of a cutoff from Glendive, Mont., to Helena. As projected, the line will pass through the counties of Dawson, Fergus and Meagher, a distance of 350 miles. The estimated cost of the work is $10,000,000. W. L. Darling, St. Paul, Minn., is Chief Engineer of the company.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Public Service has been holding hearings on the application of the Frontier & Western R. R. Co. for a certificate of convenience and necessity and for permission to exercise franchises. This company proposes to extend the line of the Buffalo Frontier Terminal R. R. to the International Bridge. The Frontier Terminal road was recently granted permission by the Public Service Commission, to build a steam freight belt line around Buffalo, a few miles outside of the city limits. The present proceedings before the commission are for the purpose of securing permission to build a connection between the proposed belt line and the Grand Trunk tracks of the International Bridge Company in Black Rock. The proposed branch will be about 4 miles long, and the estimated cost including necessary land, is $1,400,000. George A. Ricker, 702 Ellicott Sq. Buffalo, is the Engineer.

The Hoboken Railroad Warehouse & Steamship Connecting Co., operated by the Hoboken Manufacturers R. R. Co., of Hoboken, N. J., has applied to the Common Council of Hoboken for a franchise giving the company authority to extend its tracks across the city to the western boundary. It is reported that this action represents an effort on the part of the big trunk line railroads having terminals in Jersey City and adjoining riverside towns, to attain an entry for their cars into Hoboken, and through that city to the big steamship piers, thus establishing a direct route for freight from the piers to any point on the railroad line. The council will give a hearing on the application on May 27.

M. A. Talbott & Co., Baltimore, Md., have the contract for relocating the New York Central tracks through Rome, N. Y. The same company also has the barge Canal contract No. 43, extending through Rome. The two contracts amount to about $2,000,000.

The Pennsylvania, Lackawanna & Erie Connecting R. R. Co. has been incorporated under the laws of New Jersey with a capital stock of $250,000, the incorporators being William D. Braidwood, Brooklyn, N. Y., William T. Tamilton, New York City, Franklyn Doe, Brooklyn, N. Y., Henry McMath, Brooklyn, N. Y., Henry Roeber, Brooklyn, N. Y., Albert Ashton, Brooklyn, N. Y., Tilghman F. Chauncey, Bayonne, N. J.

The Public Service Commission of New York City has passed resolutions calling on the Chief Engineer to report on the feasibility of constructing a subway from Battery Park to 59th St., thence into Queens over the Queensboro bridge. The line would extend under Greenwich St., West Broadway, Varick St., 7th Ave. and 59th St., Manhattan.

The Long Island R. R., it is said, has begun active work on the electrification and double tracking of the north shore division. The branch between Winfield Junction and Whitestone Landing will also be double tracked. P. H. Woodward is Secretary and Ralph Peters is President of the railroad and J. R. Savage, Jamaica, N. Y., is Chief Engineer.

North Dakota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An ordinance has been introduced into the city council of Fargo, N. Dak., authorizing the Great Northern to construct its Fargo-Surrey line across the streets of that city from 17th to 24th St.

The Minneapolis, St. Paul & Sault Ste. Marie R. R., has purchased 12 acres of land at Kenmare, N. Dak., for the construction of extra tracks. Construction has already started on a double track from Kenmare to Portal, N. Dak., to avoid the construction of a bridge across Des Lacs Lake. Thomas Green, Minneapolis, Minn., is Chief Engineer of the company.

Advices from Devils Lake, N. Dak., state that the surveyors of the Minneapolis, St. Paul & Sault Ste. Marie R. R. have finished the line between Medford and that place and that right of way agents are expected in a few days to take up the options which were recently secured in the city property.

Work will soon be started, it is said, upon the projected Carrington-Turtle Lake branch of the Northern Pacific R. R., in North Dakota. As projected the line will pass through Turtle Lake township and Malcolm township, thence westerly about the center of McGibs township, the center of Platt township, thence in the direction of Berthold reservation and the flat where the old post office was located, about 6 miles south of the present town of Ryder on the Soo. W. L. Darling, St. Paul, Minn., is Chief Engineer of the company.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Unofficial reports state that the Hocking Valley R. R. has practically decided on the route for its proposed railroad from Wellston or Jackson to the Ohio River and a connection with the Chesapeake & Ohio. It is stated that the extension will start from Jackson and run down the valley of the Little Scioto River to Sciotoville, five miles above Portsmouth. The river will be bridged at Sciotoville, which is said to be the most available site for a crossing, as the river bottoms are wide, giving good approaches and there is a solid rock foundation on both sides of the Ohio. It is also said that the surveys show that this route is 9 miles the shortest of any being considered.

Officials of the Mahoning & Shenango R. R. Co. have been over the route of the electric belt line which the company proposes to construct at Niles.

The Central Ohio Promoting Co. has been organized at Columbus, with A. E. Boone as President, for the purpose of securing the construction of an electric railroad from Columbus to Zanesville.

The Marietta, Columbus & Cleveland R. R. is stated to have completed surveys and to have secured the necessary capital for the construction of an extension from Palos Junction, the present northern terminus to Athens, where a connection will be made with the Hocking Valley. Construction work is to be started soon, it is said. J. C. Riddell, Marietta, O., is General Manager.

The Cleveland Ry. Co. of Cleveland, has applied to the City Council of Cleveland for

authority to establish a crosstown line on W. 65th St.

The Cincinnati Union Depot & Terminal Co. of Cincinnati, has been incorporated for the purchasing of depot grounds and locating, conducting, maintaining and operating a common union station house, passenger and freight depot and terminals and a union railroad, by two or more tracks connecting the various companies for business purposes. Plans for the terminal have been prepared. The project contemplates the expenditure of about $25,000,000. The incorporators include Archibald S. White, Louis G. Hauck, F. R. Williams, General Lewis Seasongood and C. B. Matthews, all of Cincinnati.

Commissioners of Huron County have held a meeting at the County Court House at Norwalk, preparatory to having work started on the New Haven Marsh ditch. The estimated cost is about $30,000. The entire ditch is to be an open one, and in places it will be 25 ft. wide at the bottom. The construction of the ditch will commence in Huron County, at New Pittsburg, near the dividing line between this and Richland Counties, and is to run south and then east to the Huron River, into which it will empty about 1½ miles east of New Haven village.

Work is to be started at once on the improvements to the dock and ore handling facilities of the Baltimore & Ohio R. R. at Lorain. James Stewart & Co. of New York have the contract to erect the docks, machinery for handling the ore and build the storage yard, and the Great Lakes Dredging Co. of Cleveland, will do the dredging. The ore handling machinery will be supplied by the Brown Hoisting Co. The power house, which will be larger than originally, will be constructed by P. Farrell of Cincinnati.

City officials of Alliance are considering the plans of the Pennsylvania R. R. for the abolishment of three grade crossings in the city. The work will cost about $100,000.

The Erie R. R. is reported to have about completed negotiations for a new entrance into Pittsburg. It is stated that the proposed Ohio River & Northern R. R., extending from the Westpoint coal fields of the Pennsylvania state line via Wellsville and East Liverpool, O., is now on a firm financial basis, and it is expected that the construction work will be completed this summer.

The City Council of Lorain is to call for bids at once for dredging requiring the removal of about 100,000 cu. yds. of material. C. M. Osborne, Lorain, is City Engineer.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary surveys are under way for an interurban line though Pawhuska and Hominy from Arkansas City to Tulsa. Jacob Van Ransaeller, Pawhuska, Okla., is reported to be the Engineer.

The Gulf Pipe Line Co., F. A. Loevy, General Manager, Bartlesville, is to have work started at once on extending its Oklahoma pipe line into Osage County. The extension starts from Glenn Pool field and extends to Lot 52 in Osage County, a distance of 52 miles.

The Tulsa Street Ry. Co., of Tulsa, is to make improvement to its lines in that city. The company will double track on Main St. from Third to Frisco tracks and from Fifth to Eighth.

S. H. Owens, Okmulgee, Okla., has been awarded the contract to furnish 40,000 ties to be used in the construction of the Kansas City, Sapulpa & Southwestern Ry. between Sapulpa and Tulsa, the first section to be built. The road is to run to either Collinsville or Skiatook, thence southward through Nowata, crossing the Frisco at Miami and running thence to Joplin, where it will connect directly with the Kansas City Southern. No bonus money is to be paid by the towns until the line is completed and running as far as either Collinsville or Skiatook.

Advices from Oklahoma City, Okla., are to the effect that contracts were let recently to M. Cassidy, Oklahoma City, Okla., for the construction of the first 10 miles of the Denver, Kingfisher & Gulf railroad from Oklahoma City, and that the line will be let as far as Piedmont at once. Right of way has been secured, it is said. J. C. Gilmore is Chief Engineer and J. M. McDonald is President of the new company.

The Kansas, Oklahoma & Panama Ry. Co. has been chartered with a capital stock of $1,000,000 and headquarters at Sayre, Okla., and proposes to construct a line from Liberal, Kan., south to Sayre, in Beckham County, Okla., with a branch east from Sayre to Oklahoma City. Ohio and Indiana capitalists and business men of Sayre and other Western Oklahoma towns are backing the enterprise. Bonuses have been raised by a number of towns, among them Sayre, which will give $40,000. Richard W. Ruflin of Hamilton is the principal promoter, and he has been working up the project for three years and has recently completed negotiations for sale of bonds in the East. Others among the directors are John W. Lytle and W. F. Crawford of Indianapolis; D. R. Richardson, J. A. Whitehurst, G. L. Bennet and D. W. Mann of Sayre.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Coos Bay Rapid Transit Co., W. P. Evans, President, North Bend, has secured its franchise at Marshfield to operate an electric street car line in that city. The company has secured also in North Bend a franchise. The road is to be built to the city limits of Marshfield within four months and the work in the city finished within two months, thereafter.

J. F. Mounce, a railroad contractor of Eugene, has applied to the City Council of Eugene for a franchise to build a railroad through that city. He proposes to build a line from Eugene to the Coast, and already has had some surveys made and has secured much right of way. It is stated that construction contracts will be let as soon as 25 miles of right of way is signed up.

The Portland Railway, Light & Power Co. of Portland is securing right of way for its proposed line from Oregon City to Oswego, and it is said that as soon as the required rights are obtained actual construction will be commenced.

The City Council of Eugene has granted the local street railway company a franchise providing for the College Hill loop, which will add about six miles to the present street-car system of Eugene.

Material is now being shipped to The Dalles, Ore., for the construction of the proposed extension of the Oregon Railroad & Navigation Company's line from Big Eddy to that place. It is expected that the line will be ready for operation by Fall.

An announcement is reported to have been made by James J. Hill, President of the Great Northern R. R., that the proposed east to west railroad across the state of Oregon would be built and that construction work will be started soon.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress is being made with the promotion work for the Lebanon-Ephrata Street Ry. Co., which proposes to build a trolley line between the places named. George D. Krause, Lebanon, Pa., is President.

The Hummelstown & Campbellstown Street Ry. Co. is to extend its line 1¾ miles from the site of the old Greiner school house, Hershey, northward on the road from Spring creek to Horseshoe turnpike, across the Philadelphia & Reading by an overhead bridge to a point within the lands of M. S. Hershey.

The City Council of Norristown is considering the application of the Philadelphia and Western Ry. for a franchise to build an electric line through the city to connect with the Lehigh Valley Transit lines.

The Johnstown Passenger Ry. Co., of Johnstown, has decided to extend its system from a point where the Roxbury line crosses Cheney run in the Eighth ward to the new town of Southmont in Upper Yoder township, a distance of nearly two miles. Work of building the extension is to be completed by Aug. 15.

The Slippery Rock & Grove City Street Railway Co. have awarded the contract for 9.25 miles of track between Slippery Rock and Grove City to Alfred DeMayo & Co., of New York for $173,000. Work has been started and the road is to be ready for operation Nov. 1. The company will use gasoline motor cars exclusively and orders have been placed for the equipment, consisting of four passenger and two combination passenger and baggage cars. Freight cars will be ordered in the fall.

City Council of McKeesport is considering application of the Pittsburg, McKeesport & Westmoreland Street Ry. Co., for a franchise for an extension of its lines to 5th Ave., McKeesport, along Lincoln Way.

Surveys are under way for the new electric railway from Coopersburg to Rieglesville by way of Passer.

The Philipsburg & Susquehanna Valley R. R., at present operating 16 miles of line, is to extend its road from its present terminus at Fernwood to Utahville, a distance of 4 miles. J. O. Reed, Philipsburg, Pa., is General Manager.

The Connellsville & State Line R. R. recently chartered, is to have work started shortly on its projected 68-mile line. It will be the connecting link between the Western Maryland and the Pittsburg & Lake Erie. From State line to Cumberland, Md., where connections with the Western Maryland proper will be made, another syndicate has been formed to build that portion of the new road. This latter road has just been incorporated under the laws of Maryland. Warren A. Wilbur, South Bethlehem, Pa., is President. This is the extension of the Western Maryland, contract for which has already been let to the Carter Construction Co. of Chicago, Ill.

Construction work is to be started shortly on the extension of the Hanover & McSherrystown, from McSherrystown to Conewago Chapel. At the latter place the proposed new road will branch, the one line coming to Gettysburg and the other to New Oxford.

Subcontractors in charge of L. T. Herndon, Chief Engineer of the Carter Construction Co., 184 LaSalle St., Chicago, Ill., which has the contract for building the 87-mile connecting line between the Western Maryland and the Pittsburg & Lake Erie Railroads, have been going over the proposed route from Connellsville to Ohiopyle.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are stated to have been made for an extension of the Greenville & Knoxville R. R. from Greenville, S. C., to Knoxville, Tenn. The road at present is in operation between Greenville and Cleveland, S. C., and the company proposes to extend it through the mountains to Knoxville, probably by way of Asheville, Canton, Wayneville and through the Pigeon river gap of the Smokies. W. H. Patterson, Atlanta, Ga., is President.

The Bristol Belt Line Ry. Co., of Bristol, has acquired the Holston Valley R. R., a line which has been operated as a lumber road between Bristol and Holston Mountain. The company will convert it into an electric line and operate summer cars its entire length of twelve miles, establishing a park on the Holston river bank, ten miles from Bristol.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. H. Fielder and L. J. Gould, representing eastern capitalists, have made a proposition to the citizens of Somerville for the construction of a railroad west to Taylor. The road will be known as the Somerville & Taylor Short Line, and will connect the two towns on an air line of 60 miles. The proposed route will pass through Lexington and Dime

Box, and bring in some rich country through Burleson, Lee and Williamson counties.

J. G. Kelso, Galveston, Tex., has been awarded the contract for the drainage work in the Alvin Drainage District, bids for which were opened May 16 at Angleton, Tex. The contract price was 10½ cts. per yard for dry excavation and 16½ cts. for wet and $300 per mile for clearing the timber from the right of way.

Engineers are reported to have been making estimates of the cost of filling in the lower portions of the peninsula at Morgan's Point, near Houston, with a view to establishing a summer resort there. The plans are said to call for the expenditure of about $100,000. Joseph F. Meyer, Houston, is interested, it is said.

It is believed here in Houston that the Santa Fe will make an attempt to purchase the International Great Northern at the receiver's sale. Should the Santa Fe purchase this property, it is reported that it in turn will sell the Fort Worth & Houston line to the Frisco and will build from Temple to the International & Great Northern at some point most convenient, probably Marlin.

The San Antonio & Tampico R. R. Co. has been in conference with the State Railroad Commission relative to the issuance of $1,440,000 of bonds on 90 miles of the proposed road. It is reported that the railroad has been graded a distance of 18 miles. It is hoped that at least 45 miles of the road will be in operation by the time cotton begins to be moved in the fall.

M. R. Hoxie, of Lexington, Tex., has made a proposition to the Board of Trade of Taylor for the construction of the long proposed Taylor, Somerville & Gulf Ry., of which James A. Thompson of Taylor is President. The right of way of this route was surveyed and donated by property owners several years ago. It is now thought that the actual building of the proposed line will be undertaken. The idea is to extend when the line is completed from Taylor to Somerville, on to Houston.

Detailed plans have been prepared by F. L. Dormant, Consulting Engineer, Houston, for converting Buffalo bayou, between Smith and Travis Sts., into a public street, by covering it with a reinforced concrete viaduct.

The U. S. War Department has ceded a strip of its reservation on Pelican spit at Galveston, to the government health department for a site for the new quarantine station to be built for Galveston. The site embraces an area of 25.2-110 acres, being 1,400x800 ft. on the northeast corner of Pelican spit in the triangle formed by the Galveston and Texas City channel, and convenient to the Bolivar channel. The site is under water about 4 to 8 ft., and will have to be bulkheaded and filled to grade. It is understood now that the site has been determined upon that construction will begin in the near future. There is about $200,000 available for the quarantine station

Good progress is being made with the construction of the Houston-Galveston Interurban line. At the end of last week the status of the work was as follows: The hydraulic fill on Galveston island was about three-fourths completed. This consists of 120,000 cu. yds. of fill, and is being done by the North American Dredging Co. Other portions of the work, two sections of embankment work on the mainland were about 10 per cent completed. These two jobs are being done by J. C. Kelso of Galveston and Harty & Ford. The former is working the section between a point about two miles beyond Texas City junction to Clear creek, and the Harty & Ford contracting firm that section of the right of way between Clear creek and Brays bayou, at Harrisburg. Between these two, the causeway approach and the first mainland section, and between Houston and Brays bayou, there are three short sections of work. The upper two are embankment work, while the section near the causeway probably will be a hydraulic fill and embankment composite.

The Atchison, Topeka & Santa Fe Ry. has awarded the contract for two bridges on its Lometa-Brady-San Saba extension to the Union Bridge & Construction Co., of Kansas City, Mo. One of the bridges to be built over the Colorado River and the other over the San Saba River. The bridge across the Colorado River will be located 14 miles west of Dometa. It will be a structure of concrete and steel. There will be three concrete piers, built on a rock foundation, with the shaft of each pier 64 ft. in height. On the east bank of the river will be erected one concrete abutment, also on a rock foundation. There will be no necessity of driving foundation piles in consequence of the solid rock that lies below the surface. The steel work will consist of one 200-ft. truss, one 100-ft. dock girder and one 60-ft. dock girder. On the west approach to the bridge there will be a trestle approach 1,000 ft. in length. The high bank on the east side, however, obviates the necessity of any trestle construction at that point. The concrete piers will be built on the same general principle as those on the Galveston causeway, with a broad foundation and a straight shaft. In the entire bridge there will be 3,500 cu. yds. of concrete used. The San Saba bridge, which will be located 4 miles northwest of the town of San Saba and 27 miles west from Lometa, will also be of concrete and steel. There will be 1 concrete abutment and two concrete piers, also on a rock foundation. The amount of concrete used in this construction will come to 900 cu. yds. The steel work will consist of 1 100-ft. through girder and one 60-ft. through girder. This bridge will have a trestle approach of 800 ft.

Chief Engineer Dozier, Temple & Northwestern Ry., Temple, Tex., reports much activity along the line now under construction. The Santa Fe has awarded the contract for the construction of a 1½-mile track from its yards in the northern portion of Temple to the grade of the new railway in order that materials may be delivered by freight.

The citizens of Beeville have raised over $30,000 of the $50,000 bonus required to secure the Beeville & Eagle Pass R. R.

The Southern Pacific Ry., according to reports, has engineers in the field making surveys for a line from Bryan to San Antonio.

The Kansas City, Mexico & Orient Ry., it is said, is about ready to start preliminary work on the proposed extension of its line to tide water at Corpus Christi, Tex. W. W. Colpitts, Kansas City, Mo., is Chief Engineer.

Engineers of the Abilene & Southern Ry. are now running lines for the construction of the road from Abilene via Anson, Tex., to Hamlin. Construction work will be started shortly on the section of the line from Anson to Hamlin and the other section between Abilene and Anson will be taken up later. Percy Jones, Abilene, Tex., is Chief Engineer of the company.

Citizens of Brownwood, Tex., have succeeded in raising $40,000 of the required $50,000 bonus asked by the Brownwood Southwestern Railroad.

The New Orleans, Texas & Mexico R. R., the Gulf Coast Line of the Frisco R. R., is planning the construction of a branch line from Kingsville, Tex., to the Shore of Baffin's Bay at Riviera, where a new harbor will be constructed. B. F. Yoakum, New York, N. Y., is Chairman of the Board of the Frisco.

Committee of Tucumcari, New. Mex., Chamber of Commerce, is taking up the matter with Julian M. Bassett, Vice-President, and General Manager, Crosbyton & South Plains R. R., of extending the line from Spurr, Tex., to Tucumcari. John A. King, Hereford, Tex., is Locating Engineer of the company.

According to reports H. L. Mitchell, representing the North & South Railway, has submitted a proposition to the citizens of Alvord, Tex., to cross the Fort Worth & Denver R R., at that place providing suitable depot grounds will be donated with $8,000 cash bonus or 10 miles of right of way.

The Glen Rose & Walnut Springs R. R. Co., according to reports, has awarded the contract to the Utopia Construction Co., for completing the grade of the proposed line into Walnut Springs, Tex. It is expected that work will be rushed to completion and steel laid within a short time.

Farmers along the proposed route of the Santa Fe Railroad's projected Texico-Coleman Cutoff are offering a large bonus of about $200,000 for the immediate completion of the work. The last section, which is about 89 miles in length is on level prairie and will require only $1,450,000 for its construction.

An announcement recently made by an official of the Cotton Belt Railroad, at Waco, Tex., is to the effect that contract has been let to some St. Louis, Mo., firm for the construction of the extension from Gatesville, Tex., to Hamilton. A portion of the survey has already been made; an engineer will complete the work at once.

Grading work on the construction of the Missouri, Oklahoma & Gulf R. R., into Denison, is being pushed and three grading camps have been established between Denison and the crossing on Red River. It is expected that the road will reach Denison by Aug. 15

The San Angelo Street Ry. Co., of San Angelo, has offered to extend its street car system to the Junior College at San Angelo, if the citizens would raise a $15,000 bonus.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The East Warm Creek Irrigation & Canal Co. has filed its articles of incorporations at Provo. The company has been formed to control and distribute the waters of East Warm Creek, near Goshen, for irrigation and domestic purposes. The capital stock is $9,000. N. W. Nelson is President; Charles Samson, vice-president; John B. Thomas, secretary and treasurer.

The Salt Lake & Ogden Ry. Co., Simon Bamberger, President, Salt Lake City, is planning to have work started in the late fall on an electric line to form a loop from Layton to Ogden, and taking in Syracuse, Hooper and Kanesville.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the Richmond & Chesapeake Bay Ry. have completed surveys for the projected electric line from Fredericksburg to Washington, D. C., and have started work on another route from Fredericksburg by way of Manassas. They will also survey another line from Occoquan by Mount Vernon to Alexandria, thence to Washington. Wm. Northrop, Richmond, Va., is General Manager.

J. P. Pettyjohn & Co., Lynchburg, have commenced work on the construction for the erection of a roundhouse and repair shops for the Virginia Ry. at Roanoke, Va.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Stockholders of the Cheat River & Monongahela Valley R. R. Co. and the Atlantic Northern R. R. Co. met at Kingwood, W. Va., and perfected the organization of the companies. Julius K. Monroe was appointed manager of both companies. The line of the Cheat River & Monongahela Valley R. R. will run from Albrightsville, on Cheat River, following down the general course of the river, crossing the Monongahela at a point below Point Marion to a point in Pennsylvania not yet definitely decided upon. The line of the Atlantic Northern R. R. Co. will run from Rowlesburg following up the general course of Cheat River, intersecting the Western Maryland Railroad at Parsons, W. Va.

The Kanawha & Michigan Ry., R. P Black, Division Engineer, Charleston, W Va., is stated to have awarded a contract for raising its tracks and building a bridge over the tracks of the Hocking Valley at Point Pleasant, W. Va., at an estimated cost of $100,000.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Port Townsend state that F. J. Bailey has been awarded the contract to enlarge the present wharf at Irondale. The dock when completed will be extended about 50 ft. further out into the bay and will have a frontage of 400 ft.
